CHICAGO, ILL.—Hill nr Franklin st, br dwel; cost $9,000; o, Kee & Chappell; a, Harold Hansen; c, not let....W. Erie nr Elizabeth st, two br stores and flats; cost $10,000; o. John Olsany; a, Hansen; c, not let....W. Ohio and Rocker st. br store and flats; cost $10,000; o, Tobias Samuelson; a, Hansen; c, not let ...N. Clark st, cor Fullerton av, br dwel; cost $7,000; o, L. E. Heckmot; a, Holabird, Simards & Roche; c, L. Weick... 15-17 Dearborn st br st; cost $11,000; o, F. C. Porter....573–575 Blue Island av, br stores and flats; cost $19,000; o, Springfield & Johnson; a, Wolf; c, M. D Brown ...715 Adams st, br dwel; cost $8 000; o, H. W. Barrett; a, M. L. Beers; c, Snow & Alsip....76 O'Brien st, cost $6,000; o, D. F. Bremner; a. Greg. Vigeant; c, D. H. Hayes & A. E. Fortin ...583 LaSalle av, br flat; cost 14,000; o, Chas. Dagling; a, C. O. Hansen; c, C. J. Bergh....48-50 Douglas av, br dwelling; cost $8,000; o and c, O. W. Shedon .. 3,824 State st, br flats; cost $5,500: o, J. A. Raabe; a, W. Blanke; c, Jno. Scheel ....2,725 Prairie st, br dwel; cost $9,000; o, L. W. Pitcher; a, Dixon & Townsend; c, L. Wartinsen .. 213-215 W. 12th st, brick store and dwel; cost $12,000; o, Frank Rasolek; a, R. W. Ruehl; c, W. Horack....403 Hurlbut st, br dwel; cost $5,000; o and c, Fred Mener . 102 Centre av, br dwel; cost $5,500; o, C. W. Turner; a. Hutchinson; c, Galagher....600-608 Division st, brick dwel; cost $60,000; o, Wm. Dickenson: a, T. Traver; c, not let ....250-252 Wells st, br dwel; cost $9,000; o, Philip V. Johnson 827 Twelfth st, br flats; cost $5,000; o. Rudolph Bielfeld; a, a, Boasler; c. A. Dresser.... Washiel, bet 30th and 31st st, five cottages; cost $5,000; o and c, Chas. Farr....22d st by Anderson av, dancing academy; cost some $23,000; o, Prof. Bournigal; a, Burnham & Root; c, not let .. 158-160 W. Wanral st, br add; cost $5,000; o. C. Pope; a, J. J. Flanders; c, not let... 14-18 S. Canal st. br add; cost $10,000; o, Newberry estate; a, F. H. Wadskier; c, J. Mountain.

CINCINNATI, ILL.—Harriet nr Front st, br bldg; cost, $6,500; o. Geo. Kettels; b, Witte & Weber....Cor Riddle and Bank st. br bldg; cost, $25,000; o, G. P. Winchel; b, Henry Behrens .. Calhoun nr Clifton st, br dwel; cost, $13,000; o, O. Peters; b, O. Meineca.... Fourth nr Main st, br bldg; cost, $20,000; o, Spring Grove Cemetery....Dunlap nr Stark st, br dwe.; cost $8,000; o, F. Seidenburg; b, Harig & Bruegerman... 535 & 537 Central ave, br bldg; cost $10,000; o, Wm. Frillman; b, Aulfdembrinke & Co.

DENVER, COL.—Stout st. & 18 st, stone terrace; cost $30.000; o, J. G. Webster; a, F. E. Edbrook & Co.....Lincoln ave, br dwel; cost $15,000; o, Geo. Rust; a, H. H. Halley....Capitol Hill, br dwel; cost $10,000; o, F. G. King; a, Putnam & Block....Broadway, br dwel; cost $6,000; o, Edward Kesterns; a, W. M. Quayle.

DUBUQUE, ILL.—800 Bluff st, improvements to Lorimer House, Hotel water closet and general improvements; cost, $3,000; o, Lorimer House Hotel Co.

EVANGTON, ILL.—Frame dwel; cost $8.000; o, C. M. Goodrich; b, Holabird, Simonds & Roche; a, James Wigginton.

KANSAS CITY.—243 16th st, br dwel; cost $5,000; o, L. Bartlett.

LAKE VIEW, ILL.—Frame depot, c, $7,000; o, Chicago & Evanston R. R; b, Holabird, Simonds & Roche

WASHINGTON, D. C.—14th st, bet Corcoran & R st, 3 br mansard and cellar; cost $19,000; o, John Sherman & Co. a, John Sherman... B st bet 3d & 4th st, 2 br dwel; cost $5,000; o, H. K. Simpson; a, H. K. Simpson....F st, bet 17th & 18th st, br bldg with cellar & mansard roof; cost $7.800; o, M. R. Bigelow; a, Gray & Page; b, Thos. Kinney....20th st bet M & N st, br dwel; cost $5,000; o, C. Henrich; a, C, Didden; b, B. Beha....17 st bet L & M st, 4 br dwel; cost $14,500; o, D. H. Rice; a, D. H. Rice; b, D. H. Rice.

MISCELLANEOUS.

BACK BAY, BOSTON.—The new brown stone Chateau of Oakes Ames Esq, at the corner of Commonwealth avenue and Westchester park will cost $125,000. Carl Tehmer is the architect.

CHICAGO, ILL.—The new structure of the Commercial Safty Deposit Company to be erected on the corner of Monroe and Dearborn streets will cost $200,000. Jaffray & Scott are to be the architects it will be built of brown stone.

RICHMOND, VA.—$300,000 has been appropriated by the council for erecting new city hall.

ROCHESTER, NEW YORK—The Standard Sewer Pipe Company have let contracts for a building on Rowe street, to cost $60,000.

The City Council of New Orleans has appropriated $200,000 for erecting a court house and prison.

TOLEDO.—C. M. Palmer of Chicago has prepared plans for the new Hall Block, frontage on St. Clair street 175 feet, on Jefferson street 120 feet, four stories and basement, pressed brick with stone trimmings.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

267,800. JOINT WIPER, ROBERT REACH, Washington, D.C. Filed Mar. 30, 1882. (No model.) Issued Nov. 21, 1882.

Brief.—Scrape the ends of the pipe. Apply the forms of solder and sections *b* and clamp them in place. Heat and slightly rotate the clamp to melt and spread the solder.

Claim.—The combination of the sections B B, for reception of solder forms B¹, and clamp A, substantially as shown and for the purpose described.

267,825. METHOD OF AND APPARATUS FOR DETECTING LEAKAGE IN CONDUITS. THOMAS J. BELL, Cincinnati, Ohio. Filed Jan. 3, 1882. (No model.) Issued Nov. 21, 1882.

Claim.—1. The method of ascertaining and locating leaks or improper use of water in service mains and pipes in cities and buildings, consisting in receiving, amplifying and converting the molecular vibrations induced in such pipes by the escaping water, and conveying the same to the ear by means of suitable microphonic apparatus applied to such mains or pipes, substantially as set forth.

2. The microphonic apparatus consisting essentially of a metallic diaphragm centrally mounted upon a stud or transmitting rod in a sound chamber, and adapted to be applied to water or gas mains for the detection of leaks, substantially as set forth.

3. The herein-described leak detector, consisting of a body-piece, A, provided with a stud, b^1, and lug C, cap-piece A^1, having an opening, a^1, and a diaphragm, B, mounted in the chamber formed by the cap and body-piece, substantially as specified.

4. The combination of the body-piece A, cap A^1, stud B^1, and metal diaphragm, B, placed between the cap and the body, substantially as set forth.

5. An apparatus for transmitting the sounds of leakage in fluid-conduits to the ear of an attendant or inspector, consisting of the microphonic leak-detector A and the key D, the latter adapted to be applied to the cock of the service-pipe, substantially as set forth.

267,863. BASIN COCK AND OVERFLOW, JAMES FOLEY, Brooklyn, N. Y. Filed Sept. 12, 1882. (No model.) Issued Nov. 21, 1882.

Claim.—The combination, with the stand-pipe, waste-pipe, and lateral connection to the basin or bath, of the cock at the junction of the respective pipes, having a tubular plug, an overflow pipe, which is a continuation of the tubular plug, the stem and handle by means of which the plug is turned, and the cap at the upper end of the stand-pipe, substantially as set forth.

267,973. TRAP. ROBERT CLARK, Brooklyn N. Y. Filed Jan. 25, 1882. Renewed Oct. 11, 1882. (No model.) Issued Nov. 21, 1882.

Brief.—To prevent the water sinking below pipe B, by evaporation or other causes, and thus rendering the trap inefficient, a ball float regulating a water supply pipe, E, is placed in said trap and keeps the water up to the required standard.

Claim.—1. A trap provided with a ball, D, within the casing A, and with an inlet water supply pipe and cock connected to the ball, whereby the supply of water in the trap is maintained and the sealing of the trap secured, substantially as set forth.

2. The combination, in a trap, of the case A, containing the ball-valve D, the inlet and outlet pipes B C, water supply-pipe E, and cock *b*, connected to the ball D, substantially as set forth.

267,700. MACHINE FOR CUTTING SEWER PIPE RINGS. ROBERT W. LYLE, Rochester, N. Y., assignor to Otis & Gorsline, same place. Filed Sept. 14 1881. (No model.) Issued Nov. 21, 1882.

Claim.—1. A horizontally vibrating wire carrying frame arranged to swing over a suitable pipe supporting platform, in combination with means, substantially as described, whereby the relative positions of the pipe and frame are changed between each vibration.

2. In combination with a suitable supporting post, A, the swinging frame D F, wire *w*, sliding bar B, rack C, and spring catch *h*, substantially as described.

3. In combination with the swinging wire carrying frame D F, the sliding bar B, provided with two or more racks, C C¹, having teeth of different sizes, and corresponding spring catches *h j*, substantially as described.

276,143. STOVE. DOMINICUS BRIX, Geneseo, Ill. Filed Sept. 9, 1882. (No model.) Issued Nov. 7, 1882.

267,200. AUTOMATIC WATER HEATER. JAMES HAWLEY, Liverpool, England, assignor to Frederick Myers, New York, N. Y. Filed Jan. 20, 1882. (No model.) Issued Nov. 7, 1882.

267,241. STEAM BOILER. EDWARD J. MOORE, Baltimore, Md. Filed April 20, 1882. (No model.) Issued Nov. 7, 1882.

267,256. VENTILATOR. DE GARMO ROBBINS, Rochester, N. Y. Filed March 1, 1882. (No model.) Issued Nov. 7, 1882.

267,334. VAPOR STOVE. ZEBULON DAVIS, Canton, Ohio. Filed July 21, 1882. (No model.) Issued Nov. 14, 1882.

267,343. WIRE TUBING. ANDREW HARBISON, New Castle, Pa., assignor to himself and Wm. C. Harbison, same place. Filed Feb. 27, 1882. (No model.) Issued Nov. 14, 1882.

267,352. HYDRAULIC PRESSURE PUMP. SPENCER KELLOGG and JOHN WELLER, Buffalo, N. Y., assignors to Kellogg & McDougall, same place. Filed July 3, 1882. (No model.) Issued Nov. 14, 1882.

267,362. RADIATING FLUE. FREDERIC B. NICHOLS, Halifax, Nova Scotia, Canada, assignor of one-half to Cathcart Thomson, same place. Filed Feb. 21, 1882. (No model.) Issued Nov. 14, 1882.

267,388. FIRE GRATE. FREDRICK W. WEAVER and DANIEL NORTON, Troy, N. Y. Filed April 24, 1882. (No model.) Issued Nov. 14, 1882.

267,401. PIPE JOINT. DAVID A. BRISLIN, St. Louis, Mo. Filed May 9, 1882. (No model.) Issued Nov. 14, 1882.

267,409. CONDUIT FOR UNDERGROUND LINES. WILLIAM B. ELTONHEAD, Philadelphia, Pa., assignor to Ed. Y. Eltonhead, same place. Filed Dec. 29, 1881. (Model.) Issued Nov. 14, 1882.

267,410. STEAM PUMP. WILLIAM M. FERRY, Park City, Utah. Filed Aug. 2, 1882. (No model.) Issued Nov. 14, 1882.

267,411. PUMP. WILLIAM P. FIELD, Lockport, N. Y. Filed May 27, 1881. (No model.) Issued Nov. 14, 1882.

267,431. HYDROCARBON-GAS BURNER FOR BLAST FURNACES AND OTHER PURPOSES. JOHN HOSKINS, Chicago, Ill. Filed May 28, 1881. (No model.) Issued November 14, 1882.

267,445. MEANS FOR MEASURING ELECTRIC CURRENTS. SAMUEL D. MOTT, New York, N. Y. Filed April 24, 1882. (No model.) Issued November 14, 1882.

267,458 ELECTRICAL IGNITING DEVICE FOR GAS-ENGINES. ALEXANDER K. RIDER, Walden, N. Y. Filed July 20. 1882. (No model). Issued November 14, 1882.

267,461. GATE OR VALVE FOR RESERVOIRS. EMILE ROCHE, Marseilles, France. Filed July 20, 1882. (No model.) Patented in France Feb. 15, 1882, No. 147,405; in Belgium June 10, 1882; in Spain June 12, 1882; England June 15, 1882; in Austria June 17, 1882; in Italy June 17, 1882, and in Germany June 18, 1882. Issued November 14, 1882.

267,466. ATTACHMENT TO BURNER FOR GAS, &c. IRA W. SHALER, Brooklyn, N. Y. Filed April 7, 1882. (No model.) Issued November 14, 1882.

267,468. SPOUT FOR WOODEN PUMPS. BURR C. STEPHENSON, South Bend, Ind. Filed March 20, 1882. (No model.) Issued November 14, 1882.

267,478. PETROLEUM-BURNER. DAVID E. BANGS, Medford, Mass., assignor to the National Heat and Light Company of Maine. Filed June 17, 1882. (No model.) Issued November 14, 1882.

267,479. CHIMNEY-COWL. WINFIELD S. BEEBE, Middletown, Conn. Filed July 18, 1882. (No model.) Issued November 14, 1882.

262,499. GRATE-BASKET. CHARLES F. W. DANKERS, New Orleans, La. Filed May 17, 1882. (No model.) Issued November 14, 1882.

267,511. LAMP-BURNER FOR HEAVY OILS. GEORGE FLOWER, Detroit, Mich. Filed Sept. 5, 1882. (No model.) Issued November 14, 1882.

267,537. STEAM-PACKING. HENRY W. JOHNS, New York, N. Y. Filed June 13, 1882. (Model.) Issued November 14, 1882.

267,605. DRIVING TUBE WELLS. WILLIAM J. SHERMAN, St. Augustine, Fla. Filed May 4, 1882. (No model.) Issued November 14, 1882.

267 612. FAUCET. WILLIAM G. STIENMETZ, Brooklyn, N. Y. Filed Feb. 16, 1882. (No model.) Issued November 14, 1882.

267,626. LAMP. S. LLOYD WIEGAND, Philadelphia, Pa. Filed Dec. 19, 1881. (No model.) Issued November 14, 1882.

267,653. GAS-PUMP. JOHN RING, St. Louis, Mo. Filed Aug. 2, 1882. (No model.) Issued November 14, 1882.

267, 657. VAPOR-BURNER. HENRY S. BELDEN, Canton, Ohio. Filed April 14, 1882. (No model.) Issued November 14, 1882.

267,796. PROCESS OF PREVENTING THE ESCAPE OF GAS FROM OIL WELLS BETWEEN THE FLOWS OF OIL. CHARLES H. MCKEE, Lock Haven, Pa. Filed Sept. 15, 1881. (No model.) Issued Nov. 21, 1882.

267,805. CHIMNEY TOP AND VENTILATOR. EMIL R. STASCH, Corning, N. Y., assignor of one-half to George R. Brown, same place. Filed July 14, 1882. (No model.) Issued Nov. 21, 1882.

267,831. STEAM-TRAP. EMILE BRIART, Jeumont, France. Filed Dec 15, 1881. (Model.) Patented in Belgium Nov. 17, 1880. No. 53,054. Issued Nov. 21, 1882.

267,841. CONSTRUCTION OF ARCHES, Etc. JOHN H. CRUSE, Felicity, Ohio. Filed Mar. 15, 1882. (No model.) Issued Nov. 21, 1882.

267,870. ALARM CATCH BASIN FOR ICE BOXES. HENRY FUHRMANN, Chicago, Ill. Filed July 5, 1882. (No model.) Issued Nov. 21, 1882.

267,883. UNDERGROUND TELEGRAPH LINE. CHRISTIAN H. HANSEN, Washington, D. C. Filed Nov. 29, 1881. (No model.) Issued Nov. 21, 1882.

267,885. FIRE-PLACE. JAMES S. HARDING, Ripley, Ohio. Filed Sept. 2, 1882. (No model.) Issued Nov. 21, 1882.

267,894. PUMP. JOSEPH IMLER, Forest, Ohio. Filed July 14, 1882. (No model.) Issued Nov. 21, 1882.

267,910. GRATE SECTION AND FIRE BED FOR STOVES, FURNACES, Etc. WILLIAM MCCLAVE, Scranton, Pa. Filed Oct. 4, 1882. (No model.) Issued Nov. 21, 1882.

267,918. WELL-AUGER. ERASTUS J. MULKAY, Americus, Ga., assignor of one-half to Allen Fort, same place. Filed June 17, 1882. (No model.) Issued Nov. 21, 1882.

267,933. APPARATUS FOR MANUFACTURING WOOD GAS. GEORGE RAMSDELL, Oswego, N. Y. Filed Oct 14, 1881. (No model.) Issued Nov. 21, 1882.

267,971. APPARATUS FOR BURNING GAS. GEORGE H. BURROWS, Somerville, assignor, by mesne assignments, to himself and E. Gilman Colby, Greenwood, Mass. Filed Apr. 3, 1882. (No model.) Issued Nov. 21, 1882.

267,710. ELECTRIC PUMPING APPARATUS. CHARLES C. PECK and Wm. H. Chapman, Middlebury, Vt. Filed Feb. 17, 1882. (No model.) Issued Nov. 21, 1882.

267,737. GRATE. LEMUEL BANNISTER, Philadelphia, Pa. Filed July 28, 1882. (No model.) Issued Nov. 21, 1882.

267,741. VENTILATOR. MICHAEL H. DORGAN, San Francisco, Cal. Filed June 5, 1882. (No model.) Issued Nov. 21, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an urban population of 7,084,694, there died during the week ending March 17, 3,250 persons, which is equivalent to an annual death rate of 23.4 per 1,000, a decided increase on that of the preceding week which was 22.4 per 1,000.

For the North Atlantic cities the death rate was 23.4; for the Eastern cities 25.5; for the lake cities 17.1; for the river cities 20.8; and in the Southern cities for whites 22.9 and for the colored 33.3 per 1,000.

Especially high death rates occurred in New York City, Wilmington, Savannah, Memphis and New Orleans.

Consumption caused 15.7 per cent. of all deaths in the North Atlantic cities, 15.6 per cent. in Eastern cities, 8 per cent. in lake cities, 14.9 per cent. in the river cities, and in Southern cities, 19 per cent. for the whites, and 15 per cent. for the colored.

Diphtheria caused 2.2 per cent. of all deaths in the North Atlantic cities, 3.6 per cent. in Eastern cities, 6 per cent. in the lake cities, 3.5 per cent. in the river cities, and 2 per cent. among the whites in Southern cities.

Typhoid fever caused .3 per cent. of the deaths in the North Atlantic cities, 1.3 in Eastern cities, 2.4 in the lake cities, 3.5 in the river cities and .51 per cent. among the whites in Southern cities.

Scarlet fever caused 3 per cent. of the deaths in the North Atlantic cities, 3 2 per cent. in the Eastern cities, 3.3 per cent. in the lake cities, 4.9 in the river cities and 2 per cent. in the Southern cities.

Pneumonia caused 16.7 per cent. of all deaths in the North Atlantic cities, 13.1 in the Eastern cities, 8.5 in the lake cities, 10.2 in the river cities, 7.7 among Southern whites and 10.9 among Southern colored.

Small-pox continues to prevail in New Orleans.

BOSTON, MASS.—C. E. Davis, Jr., reports 27 new cases of diphtheria, ten of scarlet fever and six of typhoid fever.

DETROIT, MICH.—Dr. O. W. Wight reports 14 new cases of diphtheria and 20 of scarlet fever.

Digitized by Google

LYNCHBURGH, VA.—Dr. Thos. L. Walker, President Board of Health, reports under date of 17th inst., that there is one case of small-pox in the hospital and none in the city.

RAVENNA, OHIO.—Postmaster W. S. Krake reports (Mar. 17) the continuance of a mild form of scarlet fever in the district.

NEW YORK CITY LUNATIC ASYLUM.—Superintendent Franklin reports ten admissions, eight discharges and one death; and 1,339 insane patients remaining under treatment March 17.

GREENPORT, N. Y.—Postmaster D. Wiggins reports Mar. 19 that scarlet fever is declining, but that a death from diphtheria occurred during the week and four cases of this disease are pending.

PITTSBURGH, PA. —Dr. Snively reports one new case of small-pox.

MILWAUKEE, WIS.—Eighteen new cases of scarlet fever and seven of diphtheria are reported as having been noted during the week.

BALTIMORE, MD.—The return for the week ending March 17 shows 199 deaths; males 112, females 87; under five years 76, over 60 years 37. According to the calculation of the City Board of Health the annual rate of the whole population was 25.30, that of the whites being 21.45, of the colored people 47.67. Small-pox caused 13 deaths, measles one, scarlet fever ten, whooping cough one, diarrhœal diseases none, croup six, diphtheria 12, erysipelas none, typhoid fever two, puerperal fever one, consumption 33, congestion of lungs one, bronchitis seven, pneumonia 18, and violence four.

MICHIGAN.—The report of Dr. H. B. Baker for the week ending March 10 shows the prevalence of the following diseases in the State: bronchitis, neuralgia, rheumatism pneumonia, consumption, influenza, intermittent fever and tonsilitis. The reports from the various observers indicate a general decrease in the amount of sickness. Diphtheria was reported at 14 places, scarlet fever at 19 places, measles at 17 places and small-pox (two cases) at one place, to wit, Detroit.

NEW HAVEN, CONN.—The report for the week ending Marth 10, came too late for insertion in our table. Deaths from all causes 33; deaths under five years 13. Accidents one, consumption three, croup one, diphtheria one, malarial fever one, pneumonia five, bronchitis five, measles one, puerperal fever one and whooping cough two.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports five deaths; under five years, none. One death was caused by consumption, and one by pneumonia.

WATERVILLE, MAINE.—S. W. Bates, C. E., sends mortality reports for the seven weeks ending March 17, the weekly totals being respectively, 5, 4, 2, 6, 2, 1, and 7. Of these 27 deaths, four were caused by consumption, six by pneumonia, one by congestion of lungs, two by accident, and two by scarlet fever. Four of the deaths were of children under five years, and 9 of persons over 60 years.

NEW ORLEANS, LA.—At a meeting of the Board of Health on Mar. 8, it was decided that the quarantine should go into full effect on May 1, and that the period of detention for all vessels from designated ports shall not be less than ten full days from and after said date.

SAVANNAH, GA.—Dr. McFarland's report for the week ending Mar. 10, has been received. Deaths from all causes—white five, colored ten; under five years not stated. Cerebro-spinal meningitis caused the deaths of one white and one colored person. Consumption one and pneumonia one, both colored.

HUDSON CO., N. J.—The monthly report of C. J. Rooney, Jr., for February, an abstract of which will be tabulated hereafter, gives 21.6 as the annual rate for the county as compared with 28.3 during the corresponding month of last year. The rate in Jersey City was 20.5, in Hoboken 27.0 and in the rest of the county 20.8. The general county rate was not above the average of the month for the last six years. Jersey City's rate fell 0.6 below its average, while the rate of Hoboken rose 3.5 above its average. Deaths under five years varied but slightly from the average. Compared with the records of the past February, 1883 was not notably unhealthful.

MEMPHIS, TENN.—The report of the Board of Health (Dr. G. B. Thornton, President,) for the year 1882 shows a total mortality of 1,121; whites 420, males 270, females 150; colored 701, males 361, females 340; under five years, whites 104, colored 289; over 50 years, whites 75, colored 61. The following items are taken from the mortality returns:

White population. Erysipelas caused four deaths, puerperal fever none, diarrhœa 21, dysentery seven, typhoid fever six, malarial fever 42, small-pox eight, whooping cough one, pneumonia 18, congestion of lungs four, bronchitis four, croup two, consumption 52 and violence 21.

Colored population. Erysipelas two, puerperal fever one, diarrhœa 28, dysentery 22, typhoid fever five, malarial fevers 35, small-pox 24, whooping cough 16, diphtheria two, pneumonia 37, congestion of lungs three, bronchitis six, croup five, consumption 107 and violence 26.

The death rate calculated on the population as given by the census of 1880, to wit, 33,593, is for the whites 22.55 and for the colored 46.82, but when calculated on the population as estimated for 1882, to wit, 46,014, the rates are 14.85 and 39.45 respectively.

During the year 365 cases of small-pox were treated. These occurred mainly among the colored people. Sixty-nine of the cases were isolated and treated at their homes in the city, the others, 296, were sent to the pest-house.

BURLINGTON, VT.—In his annual report for the year 1882 Dr. H. H. Atwater, Health Officer, gives tabular statements of the mortality and its causes for the year and for the five years ending December 31 1882.

For the year: Whooping cough prevailed during the first nine months of the year, causing 14 deaths. The only other disease which assumed anything like epidemic proportions was mumps, but this was not fatal in any case.

There were 227 deaths during the year giving a rate of 19.97 per 1,000 (population 11 364 by census of 1880); males 118, females 136; under five years 88, over 70 years 44. Erysipelas caused one death, diphtheria two; croup two, whooping cough 14, diarrhœa and dysentery four, cholera infantum 7, typhoid fever eight, cerebro spinal fever two, cholera morbus three, scarlet fever one, consumption 35, bronchitis seven, pneumonia 18, congestion of lungs two and violence 12.

For the five years: Deaths 1,022, not including 88 still-births; males 505, females 517; under five years 451, over 70 years 152. Rate per 1,000 17.95. Erysipelas caused three deaths, puerperal fever four, diphtheria 69, croup 16, whooping cough 26, diarrhœa and dysentery 24, cholera infantum 65, cholera morbus four, cerebro-spinal fever ten, typhoid fever 16, scarlet fever five, measles three, consumption 137, bronchitis 32, pneumonia 62, congestion of lungs 16 and violence 42.

KINGSTON, JAMAICA.—The Registrar-General's return for February shows 126 deaths, equal to an annual rate of 40.5 as compared with a total of 63 and a rate of 20.5 during the corresponding month of last year. This increase appears due mainly to the fatality of children's diseases, as 43 deaths under five years are registered.

SANTIAGO DE CUBA.—Consul Jno. C. Landreau reports 89 deaths for the month of February in a population of 40,000. Five cases of yellow fever occurred, three of which terminated fatally. The harbor and its vicinity continue free from the infection.

CITY OF MEXICO, MEXICO.—There were 216 deaths during the week ending Feb. 4; under five years, 76; over 70 years, 10. No deaths occurred from small-pox, measles, scarlet fever, diphtheria, croup, or puerperal fever. Typhoid fever caused six deaths, whooping cough one, consumption 16 and pneumonia and bronchitis 59.

VERA CRUZ, MEXICO.—During the month of February there occurred 94 deaths; males 56, females 38; adults 72, children 22. Three deaths from yellow fever are reported.

ENGLAND.—The Registrar-Generals' return for the week ending March 3, gives 23.0 as the average mortality rate in the 28 large towns. Birkenhead recorded the lowest rate, 17.6, and Cardiff the highest, 31.0. No death was referred to any of the principal zymotic diseases either in Derby or in Bolton. Small-pox caused seven deaths in London, three in Newcastle-on-Tyne, and one in Birmingham.

London.—Births 2,773, deaths 1,590. The births were one and the deaths 238 below the average number in the corresponding weeks of the last 10 years. Annual rate 21.0. The deaths included seven from small-pox, 19 from measles, 27 from scarlet fever, 13 from diphtheria, 42 from whooping cough, three from typhus, 15 from typhoid fever, 12 from diarrhœa and dysentery, and 55 from violence.

SCOTLAND.—The return of the Registrar-General for the quarter ending Dec. 31, 1882, records 30,912 births and 19,522 deaths; the former being equal to an annual rate of 32.7 and the latter to a rate of 20.6. In the eight principal towns there occurred 7,618 deaths during the quarter. No deaths were recorded from small-pox. Measles caused 100 deaths, scarlet fever 221, diphtheria 117, croup 123, whooping cough 327, typhus fever 29, typhoid fever 96, erysipelas 32, puerperal fever 34, dysentery 12, diarrhœa 160, ague two, remittent fever five, consumption 723, bronchitis 1,219, pleurisy 26, pneumonia 510, and violence 243.

Consul J. A. Leonard, of Edinburgh, transmits the report of the Registrar-General for the week ending March 3. In the eight principal towns of Scotland the rate averaged 25.1, which is 3.5 above that for the corresponding week of last year, but 2.3 below that for the previous week of the present year. The lowest rate was recorded in Leith, 18.4, and the highest in Glasgow, 28.9. Whooping cough continues to be the most fatal miassmatic disease.

PARIS, FRANCE.—During the week ending Feb 28, there occurred 1,194 deaths; males 661, females 533; under five years, 346; over 60 years, 255. Annual rate, 27.70. Typhoid fever caused 31 deaths, small-pox nine, measles 23, scarlet fever two, whooping cough six, croup and diphtheria 47, dysentery one, erysipelas two, puerperal fever five, consumption 227, bronchitis 56, pneumonia 90, and violence 35.

On Feb. 25 there remained under treatment in the hospitals 89 cases of small-pox, 341 of typhoid fever, and 45 of diphtheria.

The death of M. Bertillon, Chief of the Bureau of Statistics, is announced in this number of *The Weekly Bulletin.*

RHEIMS, FRANCE.—During the week ending Feb. 24, Consul Jno. L. Frisbie reports that there occurred 54 deaths; males 24, females 30; under five years, 24; over 60 years, 12. Population 93,823. Whooping cough caused two deaths, diphtheria and croup four, erysipelas one, measles one, typhoid fever two, bronchitis two, broncho-pneumonia four, pneumonia two, consumption five, diarrhœa one, and violence one.

VIENNA, AUSTRIA.—Consul-General Weaver reports 472 deaths for the week ending Feb. 24; under five years, 170. Annual mortality rate, 32.7. Measles caused two deaths, scarlet fever three, diphtheria six, whooping cough four, typhoid fever five, consumption 136, and acute lung diseases 75.

ST. PETERSBURG, RUSSIA.—Consul-General Stanton transmits the report for the week ending Feb. 17, showing 683 deaths in a population of 929,525; males 391, females 292; under five years, 328; over 60 years, 63. Small-pox caused 24 deaths, and fevers 33. On Feb. 18 there remained under treatment in the hospitals 73 cases of small-pox, 1,149 of fever, and 1,241 of venereal diseases.

COPENHAGEN, DENMARK.—There were 126 deaths during the week ending Feb. 20; under five years, 62. No deaths are recorded from small-pox, measles, scarlet fever or diphtheria. Croup caused one death, whooping cough five, typhoid fever one, diarrhœa six, erysipelas two, consumption 18, pneumonia 11, bronchitis five, pleurisy two, and violence two. Rate 24.76.

During the week the following cases were reported: Scarlet fever 24, diphtheria 81, croup four, whooping cough 48, typhoid fever six, diarrhœa 87, dysentery one, erysipelas 19, puerperal fever two, catarrh 437, pneumonia, 71, tonsilitis 149. No cases of small-pox or measles were reported.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits report for the week ending Feb. 17. Total deaths 82, equalling an annual mortality rate of 24.5 per 1,000; males 35, females 47; under five years, 36; over 60 years, 14. No deaths are reported from small-pox, whooping cough or typhoid fever. Measles caused six deaths, scarlet fever four, puerperal fever one, croup and diphtheria three, diarrhœal diseases five, consumption 16, pneumonia seven, bronchitis ten, and violence three.

During the week ending Feb. 24, the following cases were reported by the physicians: Measles 66, scarlet fever 14, typhus two, erysipelas five, whooping cough 11, diphtheria 11, croup none, typhoid fever five, diarrhœa 22, tonsilitis 22, pneumonia 11, pleurisy one, and bronchitis 87.

MADRAS, INDIA.— During the week ending Feb. 2 there were 266 deaths equal to an annual rate of 34.7; males 119, females 147. Small-pox caused 14 deaths, measles one, fevers 66, dysentery 25, diarrhœa 19 and cholera none.

During the following week, (ending Feb. 9) the deaths numbered 275 equal to a rate of 35.9; males 134, females 141. Small-pox caused 15 deaths, measles one, fevers 90, dysentery 18, diarrhœa 15 and cholera none.

BOMBAY, INDIA.—Consul B. F. Farnham reports for the week ending Feb. 6 that the total number of deaths was 597 being 101 more than in the preceding week, and 91 more than in the corresponding period of the preceding five years. The annual rate was 35.97. Accidents caused 32 deaths, remittent fever 98, acute lung diseases 86, diarrhœa 20 and dysentery 18. Small-pox caused 71 deaths and measles 18 during the week.

SHANGHAI, CHINA.—Vice Consul-General F. D. Cheshire reports Feb. 6 the continued prevalence of small-pox among the natives, and two deaths from this disease among the foreigners.

COLOMBO, CEYLON.—During the two weeks ending Jan. 27 and Feb. 3 there occurred respectively 27 cases of small-pox with two deaths from the disease and 35 cases with eight deaths.

MORTALITY STATISTICS.

RAT PORTAGE, *Feb.* 19, 1883.

To the Editor of THE SANITARY ENGINEER:

The mortality tables published in your journal are a most valuable addition to it, and I think their usefulness could be still further increased by substituting the percentage of deaths from each disease to total deaths for the number of each; also by adding a column for "diseases not specified," which would be useful whether the change is made or not, as at present a large percentage is not accounted for. Trusting it may be convenient for you to make the change which will give expression to numbers, the majority of which now convey but little meaning except to those who have time to work it out in the manner suggested for themselves, I am Yours truly,

R. ADAMS DAVY.

[The publication of reports of deaths by THE SANITARY ENGINEER has thus far been somewhat of an experiment, and it has not been considered worth while to make changes in the forms employed until it should be determined whether the National Board of Health would resume the publication of its Bulletin. Now that Congress has refused to grant to the Board the funds necessary for this purpose, THE SANITARY ENGINEER proposes to make these statistics as complete and as useful as possible. It will soon begin to publish a series of papers on vital statistics, by Surgeon John S. Billings, U. S. Army, in which the subject of methods and forms will be discussed. Meanwhile we beg to remind our correspondents of the importance of forwarding *promptly* and *regularly* the weekly postal card reports upon which our tables are based. When the report from a single city for one week is missing, it makes it almost impossible to draw accurate conclusions from a comparison of the table for that week with that of other weeks.

The special points urged by our correspondent will receive due consideration. The cost of the labor of calculating weekly percentages of each disease for each city would be considerable, and we think hardly justified by the value of the results. It may, however, be worth while to make such calculations for groups of cities. As regards the number of cases from diseases not specified, that is so easily found from our table, and is of so little interest, that we really do not see its utility. For example, take the report from Cambridge in the table in this journal. During the week ending Feb. 24 there were 23 deaths, 13 of these are reported under specified causes and of course there were ten due to causes not specified.

We shall, however, endeavor to get this table into the most practically interesting and useful form possible, and as the first step towards this end we solicit prompt and regular reports.]

FIRST REPORT OF THE STATE BOARD OF HEALTH OF ARKANSAS, from it Organization April 27, 1881 to December 1, 1882. 181 pp., 8vo. Little Rock: 1883.

We are glad to welcome another new-comer to our collection of State Health Reports, and hope it is the first of a long and valuable series. The present report is mainly taken up with an account of the organization of the Board and with tables of reports of deaths in Little Rock. These last are given by months, and the ratio per 1,000 of estimated population has been calculated for each month, but

Digitized by Google

the compiler has forgotten to give the total for the year, which is a serious mistake in such a table, intended as it for educational purposes.

The attention of the Board was called to the bad sanitary condition of that portion of the State House occupied by the Supreme Court, by a very suggestive letter from John R. Eakin; but it does not appear that the Board made any any investigation or definite recommendation in the matter.

An interesting note is furnished by Dr. D. H. Dungan relative to the outbreak of choleroid diarrhœa in Little Rock in December, 1880, due to the use of water from a well within, thirty feet of which was a leaky sewer. It is almost unnecessary to say that "the water was remarkable for its crystalline purity." Water thus contaminated is almost always considered to be of superior qnality by those using it.

We are sorry to see the Board endorsing the highly exaggerated and sensational report in the prevention of venereal diseases, made by Dr. Gibson, to the meeting of the American Health Association in New Orleans. If the State Board wishes to retain the confidence and support of the public and of the medical profession, it will hereafter let this subject severely alone; in fact, we can hardly conceive a more certain mode of committing suicide for a health board than to follow the lead of this report.

The total amount appropriated for the expenses of the Board for two years was $3,000, of which there had been expended to date of the report $1,822.77. In its next report we hope the Board will furnish some definite information as to the prevailing diseases in the State, the sanitary condition of certain localities, etc., etc.

JAMES O. MORSE.

Mr. James O. Morse, one of the earliest members of the American Society of Civil Engineers, for many years its treasurer, and for the last thirty years engaged in steam heating engineering in this city, died of apoplexy at Englewood, N. J., the 8th inst. Mr. Morse's health had been impaired for two years, necessitating a partial withdrawal from business. He was struck down in his office in this city on the 5th, and died three days later.

In early life Mr. Morse, who was born at Cherry Valley in this State in 1818, graduating from Hamilton College in 1836, was a civil engineer, and was employed on the Genesee Valley Canal, and in locating the route of the New York and Erie Railroad west of Port Jervis. He was the first assistant to A. J. McAlpine in constructing the U. S, Naval Graving Dock at Brooklyn. On the completion of this work Mr. Morse built the Savannah Water Works. He then came to New York and entered the business of iron pipe and fittings at 79 John street, afterward removing to 76 John street, where he carried on the business until his death.

Mr. Morse was for many years interested in steam heating, doing some large jobs for their day, notably the A. T. Stewart uptown and downtown stores and Bellevue Hospital. In 1869 he constructed the Bergen County, N. J., Gas Light Company's works, of which he was president, and under his personal supervision the topographical survey of Englewood Township was executed.

Mr. Morse was an intimate friend of the late Robert Briggs, in conjunction with whom (shortly before Mr. Briggs' death), he made a sanitary survey of the Equitable Building in this city, which was the basis of a joint report by Mr. Briggs and Mr. Morse.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our origina packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Persons who feel friendly to this journal can do it a service by examining its advertising columns, and, whenever they see anything of interest there, by mentioning the paper when they write to the advertiser.

Proposals.

PROPOSALS FOR SEWERS, WATERBURY, CONN.

Sealed proposals for the construction of about two miles of brick and pipe sewers in the city of Waterbury, Conn., will be received by the Board of Sewer Commissioners until two P. M. of Thursday, April 12, 1883, at which time they will be publicly opened and read.

Bids are to be made on the forms furnished by the commissioners and accompanied by the proper bond.

Forms of proposal and specifications may be obtained and plans seen at the office of the City Engineer, Baldwin's block, Bank street, on and after Monday, March 26. The Board reserves the right to reject any and all bids. By order of the Board of Sewer Commissioners,
N. J. WELTON, *C. E.*
March 17, 1883.

Furnishing one first size double pump, straight frame, circulating coil boildr steam fire engine, having two steam cylinders 7¼ inches diameter each, two pumps 4½ inches diameter each by 8 inches stroke. Until April 5th. Address, THOMAS BROWN,
Secretary, Cincinnati, O., Fire Department.

HUGH HASTINGS, Jr., *Editor.*

A MOST VALUABLE WORK for Students in Engineering, Instructors in Technical Schools and Engineers engaged in the Practice of their Profession.

THE MATERIALS OF ENGINEERING.

A work designed for Engineers, Students and Artisans in Wood, Metal and Stone. Also, as a Text-book in Scientific Schools, showing the Properties of the Subjects Treated. Well Illustrated. In Three Parts.

Part I. THE NON-METALLIC MATERIALS OF ENGINEERING AND METALLURGY, with Measures in British and Metric Units, and Metric and Reduction Tables. (Now ready.) 8vo. $3.50.
Part II. IRON AND STEEL. The Ores of Iron; Methods of Reduction; Manufacturing Processes; Chemical and Physical Properties of Iron and Steel; Strength, Ductility, Elasticity and Resistance; Effects of Time Temperature and Repeated Strain; Methods of Test; Specifications. (Just ready.) 8vo, Cloth. $5.00.
Part III. THE ALLOYS AND THEIR CONSTITUENTS. Copper, Tin, Zinc, Lead, Antimony, Bismuth, Nickel, Aluminum, etc.; The Brasses, Bronzes; Copper-tin-zinc Alloys; Other Valuable Alloys; Their Qualities, Peculiar Characteristics; Uses and Special Adaptations; Thurston's "Maximum Alloys;" Strength of the Alloys as Commonly Made, and as Affected by Special Conditions; The Mechanical Treatment of Metals. (Shortly.) 8vo, Cloth.

It has been the endeavor of the author of this treatise to place in a compact, convenient and carefully arranged handbook the standard facts and formulas relating to all the principal materials used in Engineering construction, and to include the results of the latest investigations. Much of the latter class of matter is obtained directly from the note-books and records of his own investigations, and is therefore comparatively free from the uncertainty and inaccuracies which often arise in compiling from a series of writers.

SANITARY VALVE

WATER CLOSET.

A perfect seal against Sewer Gas. Absolutely pure. The Outlet Valve of Closet is provided with double rubber packing with feather edges, which effectually prevents waste of water from the Basin. Send for descriptive Circular.

COOPER, JONES & CADBURY

PHILADELPHIA, PA.

The Durham House Drainage Co.

IS prepared to contract for the supply and construction in place, of drainage on the Durham System, in new buildings, of all classes and for all purposes, at any point, and for the removal and replacement of defective drainage work by the improved system.

This Company does *only one class of work*, whether intended for the smallest cottage or a large public building, and whether by contract or by day's labor. We desire particularly to interest and serve that large class of intelligent people to whom cost is an object.

This Company not only manufactures the materials it uses (excepting pipes), but it invariably constructs the drainage system complete, with its own workmen, and under the supervision of its own engineers.

In addition to the perfect system of construction which we offer to the public, we are further entitled to its confidence from the fact that this Company does not license individuals over whom they could have no control, to construct drainage on the Durham System. We decline to sell our special fittings to be used independently of our knowledge or control. It is a cardinal principle in our business that we must know personally that every piece of work bearing our name is thoroughly well done.

OFFICE OF THE COMPANY,

No. 187 BROADWAY, NEW YORK.

DEALERS IN SUPPLIES OF EVERY DESCRIPTION,
28 PLATT STREET, NEW YORK.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost

4th. They do not have to be taken from their places to be repaired

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves

Circulars sent on application.

THE "ECLIPSE"
Hand Pipe-Cutting Machine.

THE "ECLIPSE" HAND PIPE-CUTTING AND SCREWING MACHINE will be found a very convenient and efficient substitute for the heavy and costly Power-Machines usually employed to cut the larger sizes of Wrought Iron, Steam, Gas and Water Pipes.

While it is substantially built, and designed to work easily and without strain on any of the parts, it is at the same time very compact and portable.

It will cut off and thread 2½, 3, 3½ and 4 inch Pipes, and is so powerfully geared that a stout boy can easily cut and thread 4 inch Pipe with but a 12-inch Crank.

PIPE-FITTERS AND INDUSTRIAL ESTABLISHMENTS, who have occasion to cut Pipes within the range of the "ECLIPSE," will find it a most convenient and labor-saving tool, and as such we invite their attention to it.

Address, *PANCOAST & MAULE,*

"THE MURDOCK."

Of the many Patent Hydrants that have been put on the market, none have had the sale, been so durable, or maintained their high reputation as the

"Murdock" Anti Freezing Hydrant.

It has many imitations, has often been undersold, but never equalled in the estimation of those able to judge from experience. We know of their being in use nine years with severe treatment without requiring repairs.

Patentees and Sole Western Manufacturers,

J. G. MURDOCK & CO.,

195 West Fifth St., Cincinnati, O.

We will be glad to send, if requested, illustrated circulars, describing the Hydrant Street Washer, and Combination Hitching Post and Street Washer.

Steam Heating for Buildings

OR HINTS TO STEAM FITTERS.

By WM. J. BALDWIN.

Price, $2.50

Manufactory, FLATBUSH, L. I

BENNOR'S

Syphon Trap.

The only Brass Trap in the market.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

Agents wanted. *17 North 9th St., Philadelphia, Pa.*

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings.

A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

NEARLY three years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

BOYLE'S PATENT

Tidal Wave

WATER CLOSET.

Patented in all principal countries.

SECTIONAL VIEW.

A—Air Pipe. C—Supply Pipe.
B—Flush Pipe. D—Vent.
E—Connection for Fresh Air Pipe.

A New Departure in Water Closets.

The closet is made of one piece of earthenware, and supplied with Waste-Preventing Cistern coming under the lowest rate of taxation, as adopted by the Department of Public Works of New York.

Wherever in use, the closet has given entire satisfaction, and is recommended by leading authorities on sanitary matters as coming up to the requirements of a first-class appliance of its kind, being

Simple and Positive in Operation, Clean in Use and Perfect in a Sanitary point of view.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption bein only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

PATENT CISTERN CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

THE "HYGEIA"

SIDE-OUTLET CISTERN CLOSET.

We take great pleasure in calling the attention of our customers, and all interested in sanitary matters, to the "Hygeia." For perfect cleanliness and simplicity of construction, we invite comparison with any Cistern Closet ever made, either of home or foreign manufacture. In short, we think, as do also those of our customers who have used this Closet in all their fine work for the past year, that it is, *par excellence*, ahead of anything yet made in the way of a Water Closet.

THE "ACME"

DIRECT-OUTLET CISTERN CLOSET.

To those who have a preference for a Direct-Outlet Closet we offer the "ACME" as being strictly first-class in every respect; it has been extensively used during the last three years in fine work in both public and private buildings, and has in all cases given the very best satisfaction. One important feature in this Closet is the outlet, which is full four inches, while most Closets of this class made hitherto are not over three inches.

COMPLETE ILLUSTRATED CIRCULARS SENT ON APPLICATION, WITH PRICES.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

PLUMBERS' PROFITS.

It is reported that efforts are being made to have Master Plumbers from all parts of the United States meet in convention in this city in June, to discuss measures looking to some concert of action on the part of these gentlemen, with regard to the alleged practice on the part of certain wholesale dealers in plumbing materials of selling to consumers at wholesale rates and ignoring master plumbers in the transactions. In fact, it is even stated that in certain instances the prices have been less than those quoted to responsible and reputable men engaged in carrying on the business of plumbing, who have a shop and keep competent workmen in their employ.

It is further said that cases have occurred where dealers have offered to sell materials to a party building a house, and have, in fact, furnished a so-called journeyman plumber to put them in, these dealers at the same time pretending to do no plumbing, and soliciting and receiving the trade of men in the plumbing business. No doubt, to many persons, this practice may seem all right, and will be justified on the ground that the question is controlled by the laws of trade, and is the necessary consequence of the active competition growing out of the multiplication of firms, within the last ten years, who manufacture and deal in plumbing materials, and that it is not different from the prevailing custom with other trades identified with the construction of buildings.

It is asserted that wholesale dealers who conduct their business in this way, attempt to justify their action by stating that the plumbers do not protect each other, that when they estimate on work, they frequently take jobs for less than the cost of materials, and when, under such circumstances, the dealer sells to the plumber, the owner really gets the materials for less than they are worth; sooner or later the plumber fails, and is unable to pay for the goods used. They therefore hold that under the circumstances if they want to sell their goods and get paid for them, they had better deal directly with the transient customer, and take his cash; and that, as their trade with plumbers is so scattered, they can yet retain a great deal of it, since many of their customers do not know of these practices; and as a matter of fact, they do retain a great deal of plumber's trade.

We have all along supposed that there has been an improvement in the business of those plumbers who are known and have the confidence of their customers, and we think the letter, elsewhere printed, from a gentleman in Worcester, relates an experience that many of our readers have had; yet there may be others less fortunate, who, from various circumstances beyond their control, have suffered from competition with the people they buy of. If such be the case, it strikes us that our Worcester correspondent's method is the only feasible plan of dealing with the problem.

This is a question on which a great deal can be said on both sides, yet we are firmly of the opinion, that the continued increase of the practice here complained of, will result in injury to the community where it prevails, as well as demoralization to a legitmate business. If within the plumbing trade men of character, reputation and responsibility, are to be retained, and others induced to enter it, the occupation must hold out hopes of pecuniary reward. That the occupants of our houses will be safer if such be the case, no one familiar with the subject will question. We are, therefore, glad to hear of this movement, and shall take an interest in its progress, of which we propose keeping our readers informed; meanwhile, we shall be glad to hear their experience, in this particular, in their respective localities.

HOW A SCHOOL COMMITTEE GOT A WARMING AND VENTILATING APPARATUS.

A correspondent informs us that the usual mode of procedure in warming and ventilating buildings is for the interested parties (owners or committees) to ask three or four steam fitting houses to submit plans and prices for warming, etc., the specification generally being oral and as follows: "To properly warm the building and do everything in a first-class manner, with all the newest improvements."

The question is, "What do they want?" The best? They don't know what the best is, but reason that some one of the houses will submit something that is very good, and that they are business men enough to select the best.

A case in point was that of a school committee of five who asked three firms to bid on the warming of the new school house.

A came first, and looked the building all over, and then asked, "Who else is going to bid on it?" "Oh! B and C. Yes, I know them. B got the school in the other ward; *he was the lowest*, and C took the opera house block from us. Beat us by $5. I think I might as well withdraw. I cannot do that kind of work."

Then B and C came and saw the building, and found out who else was going to bid on it (information which was eagerly given for the purpose of stimulating competition), and B remembered where A and C had beaten him in price on two or three different occasions, but reflected that

Digitized by Google

now he knew pretty well what their practice was, and decided he would catch them both this time.

The day for opening bids and examining proposed plans came, and all three were on hand with their big envelopes. A's bid was $4,000, C's bid $3,200, and B's bid $1,908.98.

A and C were friends now, and began to compare notes, and one said, "What can he do for $1.900? Why, the stock alone for such a job will cost that. But neither of them waited until the night session in hopes that their better specifications and more thorough plans would be the means of securing them the job. No, they knew the cheapest man would win.

At the night session the secretary of the board read the specifications aloud, and the committee all examined a fine drawing submitted by A, but when they began to discuss the relative merits of the different propositions they found they were mixing matters and requested the secretary to read them all over again. But then found they were not sufficiently posted in technical matters to properly comprehend the differences, and one proposed to tabulate and see what that would do for them, but they found the items could not be made to correspond in any way, as the details were entirely different, the modes of heating not being the same. After another hour's fruitless endeavor to learn which was the fittest plan aside from the price, one of the committee said, "You will notice that the guarantee is about the same in all; but I also wish to call it to the attention of the committee that we are obliged to let it to the lowest responsible bidder, and I cannot see why one plan is not as good as the other." * * *

B got the job, but had to sue for his money, the court decided it was done according to the specification, and he was accordingly paid. * * * They are putting a new apparatus in that school now.

NEW YORK'S WATER SUPPLY.

No. XI.

THE SUPPRESSION OF WASTE.

(Continued from page 386.)

In the preceding articles we have endeavored to show what, in the absence of stringent regulations, is inevitable in any community that has a public water supply, namely, that habits of wastefulness are formed, grow, and become difficult to control; that sooner or later, as a direct consequence, scarcity prevails and demands exceed anticipation. Hitherto these demands have been met by taking possession of available sources of supply or increasing pumping facilities. Such sources, however, are rapidly becoming scarce, and the pumping is found to be expensive; indeed our conditions are rapidly assuming the proportions found in Great Britain, and like Great Britain we must grapple with this problem of waste and its prevention.

The experience obtained there we have briefly outlined in foregoing chapters, and so far as we are acquainted with the facts, we have given our American cities credit for what they have done in that direction, though we regret so little is to be recorded. It now remains to enumerate the methods that might be made available in the City of New York—provided the needed money and powers be granted—and to suggest the various conditions involved that seem to require consideration.

First. The placing of a meter in every house, assuming no control over plumbing, but relying on consumers' desire to economize in water tax to secure a stoppage of waste, to cause the reconstruction of defective plumbing and the removal of wasteful fixtures.

This plan suggests the following points for consideration:

Will the knowledge that water is to be paid for by measurement have the effect of preventing any considerable number of our people from bathing, and from using sufficient to properly flush water closets and urinals, thus producing unsanitary conditions?

Can this be obviated by allowing an ample amount per capita for legitimate use, for which a specified tax is to be made, said tax to be paid whether this water is used or not, but whatever may be used in addition thereto to be paid for by measurement?

Since large numbers of consumers are tenants, moving every year, are they likely to find it cheaper to retain leaking fittings, wasteful fixtures and pipes exposed to frost, paying the water rates required, rather than go to the expense of reconstructing the plumbing in a house owned by another in which they have but a temporary interest?

Would a consideration of the foregoing indicate that the use of meters would make the supervision of plumbing in buildings superfluous in this city?

What measures should be adopted to ascertain when waste was taking place under ground?

What would be the probable expense of placing meters in the 95,000 houses in New York? that is, cost of meter and expense of setting them, and what time would be required to do it?

What would be a fair amount to charge for interest on the outlay, cost of repairs and maintenance, and what amount per year should be allowed for wear and tear?

What amount would be required for the clerical staff to keep the accounts and render quarterly bills, which would seem necessary if the bills are to be relied on to enforce care in the use of water?

What number of inspectors would be required to take the readings of the meters?

Should the city pay for meters, if it is decided that they be used, or should the Providence plan be resorted to, namely, revise the water rates so that a charge be made for every tap and fixture, unless the houseowner elects to accept and pay for a meter, it being understood that a specified tax shall be paid whether water is used or not, but only the excess of this specified amount to be charged for by measurement?

If the general use of meters in this city is objected to, and systems of inspection are to be relied on, are the inspections to be made only where waste is indicated by the adoption of some agency like the Deacon Meter, Bell's Waterphone, Church's Indicator, or any other device, to indicate the flow of liquids?

Are examinations of premises to be restricted to those in which some outside agency indicates waste is occurring?

Would the interest on the cost of adopting and maintaining some outside agency to determine where waste, either underground or in a building, was prevailing, be more than offset by the facility of reaching leaks, the probable employment of a smaller force of inspectors, the being able to have a check on their operations, and the exemption of householders whose fittings are in good order, from periodical visits and the annoyance attendant thereon?

If fittings were required to conform to a standard, to be examined and stamped (fees to be charged therefor), would not the occupants of the houses, or those who buy them, be saved the expense of frequent repairs, early renewals, and would waste in any measure be prevented?

Is it possible in a large city, with a large moving populaton, occupying buildings erected or owned by others, to secure the proper location of pipes and the use of proper fittings in the absence of rules rigidly and constantly enforced?

With the conditions existing in New York, what outdoor agency to indicate when waste was taking place, either in or outside buildings, could be adopted with the best advantage, taking into account cost and results to be obtained?

If the former two plans are deemed impracticable, is there any that can be adopted that will secure any reasonable results other than the Manchester system, which requires the testing and stamping of fittings, that plumbing work be done in accordance with prescribed rules, and that all wasting or wasteful fittings be replaced by approved and proper ones, and that all buildings, and all parts of buildings, where water flows shall be frequently inspected? And must the annoyance to houseowners therein involved, be imposed?

Would any system secure adequate results that did not involve the testing and stamping of fittings, supervision and control of plumbing, inspection of buildings, repair or removal of defective and wasteful fixtures?

Which of the plans described would involve the constant employment of the smallest permanent staff in proportion to the results obtainable?

We have here indicated some of the questions to be considered by those who may be required to adopt and sanction a plan for cities like New York; and they are ones on which we should be glad to get the views of such of our readers as have had experience in these matters. It will be evident that, no matter which method is adopted, a considerable expenditure of money is inevitable, that with one scheme the first outlay may be larger and the cost of maintenance more, while another, though probably more annoying to householders, involves a smaller investment and a less cost of maintenance, though to obtain adequate results, requires a better system of administration, and a better class of men, than have hitherto been selected for such duties.

It is clear that something must be done and the longer it is put off the more complicated becomes the problem and the greater the final expense.

A demand from the Commissioner of Public Works for the needed money to carry out any effective plan, will, in the present condition of public sentiment, meet with opposition and suspicion.

Without discussing the causes that produce this feeling we are of the opinion that the best thing to be done under the circumstances, is to have the Mayor appoint a commission of three gentlemen, who have the confidence of the public and the profession, one of whom, at least, shall be a civil engineer of experience in the matter of water supply and distribution, and who is not directly or indirectly interested or identified with any system or plan. These gentlemen should take testimony and investigate the subject thoroughly, and, as soon as practicable, recommend a plan. They should also submit a bill for enactment, if any additional legislation seems to them necessary.

If this is done, and any reasonable plan honestly and efficiently carried out and enforced, this city will be relieved from severe burdens and very possible calamities, and if the information we have gathered and recorded will in the slightest degree contribute anything toward the accomplishment of so desirable a result, we shall feel amply repaid for the labor envolved in the preparation of these articles.

The Society for the Prevention of Cruelty to Children have reported to Inspector Esterbrook the results of an inspection of the condition of the schools and homes of the charitable and religious organizations in this city. On the whole their report is better than might be expected; nevertheless the lack of adequate means of escape in case of fire, which is the principal cause of complaint, ought to receive the earnest attention of the Department of Buildings. Several of the cases seem to be such as should rather have been reported to the Board of Health, as they involve defects of plumbing which, we infer, can be remedied at no great expense or trouble It is well that there is in this city an organization which is making it a special duty to ascertain and report the actual condition of buildings of the character here noticed.

PLUMBING IN AN OFFICE BUILDING.

The sketches we present this week, show some of the plumbing done by Mr. T. J. Byrne, in the "Duncan Building," at the southwest corner of Pine and Nassau streets, this city, which has for some months been undergoing reconstruction and is now nearly completed.

Figure 1 shows the water closets as arranged on each floor, one set above another set. The most notable feature, and that to which we would call special attention, is the extensive use of tile on the floor and walls, illustrating the growing tendency to substitute tiling for woodwork in such places. The floor, in front of the platform on which the closets are placed, is wholly of unglazed tile, of different patterns and colors on the several floors. The border of the platform is of marble, but the whole remaining surface of white glazed tile. The earthenware closets are set directly on this tiled floor, and are not enclosed. The only wood about them is the seats, which are supported on cleats fastened to the polished hard wood partitions and hinged at one end to turn up against the partition. The latter ends more than a foot above the floor, being supported by the wall behind, and a leg or small pillar in front. The ends of these wooden legs are protected by high brass collars to keep off the water when the floor is washed. The doors in front of each closet are of slats and reach only to within a foot of the floor. Free circulation of air is thus allowed between the different closets, and between the closets and the room. The entrance to the room is in front of the middle closet, and over the door is a transom window. On the right is a large window (4 x 6 ft.), into a covered court about 25 feet square, and in the corner near it (behind the slop-sink), a ventilating shaft about 2 ft. square, containing the pipes, and having an opening, covered with slats, about eight feet above the floor. The walls of the room, to a height of six feet, are covered with glazed tiles.

The closet traps are ventilated by 2-inch pipes *a, a*, from the crown, which run to the wall and several feet up on the same separately, before joining, as shown. The main vertical pipe *b*, into which the separate vents are branched, increases in size toward the top, from two to four inches. The vents, *c c*, from the closet side of the trap, are arranged in the same way. Of the latter, the two shorter horizontal branches are 1½ inch, and the longer branch to the right hand closet 2-inch. The main line, *d*, is 2-inch, and like the branches, is of galvanized iron.

The 3-inch pipe, *g*, coming through the casing of the shaft on the right, and ending in a funnel on the top of a 4-inch pipe, which passes back into the shaft, is the overflow from the tank. It does not strictly belong in this sketch, since it is found only on the top floor, while the room shown is one below. On the top floor the trap of the earthenware slop-sink is within the shaft behind it, and the tank overflow enters the dip of this trap, the arrangement shown on the casing being to break the connection between the tank and house-drain. The top of the funnel is covered with course wire netting, except where the pipe *e* enters it. The whole arrangement in sight is of copper.

The closet trap, and waste and ventilating pipes are imbedded in the cement forming the platform, being at first supported on small brick piers, on the brick arched floor and not on blocks of wood as represented. The horizontal pipe coming to the front in the floor under the slop-sink *f*, is a 3-inch waste pipe from two urinals in the corner, opposite the sink. These are shown in the smaller drawing, Figure 2. The partition slabs, back and floor, are of marble. The notable feature is the method of connecting the waste pipes with the trap. The foot waste is directly over the trap, into the dip of which the urinal wastes connect. The trap is 3-inch, the branches 1½ inch, and the vent from the crown of the trap 2-inch.

FIGURE 1.

Figure 3 shows a horizontal boiler in the janitor's kitchen on the top floor, supported by brackets on the wall over the range. The peculiar feature of interest is the return by a ½-inch (galvanized iron) pipe *b*, to above the tank, of the 1¼ inch supply *a*, from the tank to the boiler, or in other words, taking the relief pipe from the cold water pipe instead of the hot. The pipes *c* and *d*, to and from the water-back, are 1¼-inch, and the hot water pipe 1-inch. This supplies only fixtures in the janitor's apartments. The offices are supplied from a large boiler in the cellar, the arrangement of which we may hereafter describe.

Hamilton, Ont., has a course of lectures on Sanitary Science. In the fourth of the series, Dr. W. Oldright spoke of the pollution of house sites, and thought they should be inspected by competent officers before dwelling houses were erected. It is a fact that many houses are built upon "made up" ground that are a source of constant trouble. Hollow

FIG. 3.

places are often filled up with rubbish frequently containing garbage, which ferments and gives off gases dangerous to health. This filling is covered with a few feet of earth, and soon presents the appearance of a good building lot. To improve our sanitary condition the doctor recommended: (1) Inspection, not only of building sites, but also of buildings, during the course of their construction, by a health officer. (2) Better architectural plans for admitting sunlight; the air cannot be pure in a room that is cut off

FIG. 2.

from the direct rays of the sun. (3) Better plumbing and proper means for ventilating sewers. (4) Adequate provision for exchanging the air of dweling houses by the constant introduction of pure air.

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XIX.

DIRECT RADIATION.

Va'ue of Heating Surfaces.

It is generally supposed that a square foot of surface in steam pipes within a room has the same value, no matter how or where they are placed.

Specifications generally call for a certain amount of surface in radiators or coils, as the case may be, seldom giving dimensions, thereby relieving the contractor when the given amount of surface is furnished, as if it were so many pounds of pig iron the contract called for.

It is no uncommon thing, within buildings with two rooms of the same capacity and same cooling conditions generally, to find one comfortably warmed in cold weather while the occupants of the other are complaining. The heating surfaces are the same, and their positions are alike, and no apparent cause can be found for the difference. But a close observer notices, that in one room (the cold one) the radiator is four pipes wide and ten pipes long, and that in the other, the comfortable one, the radiator is two pipes wide and twenty long, and wonders if that can have anything to do with the difference of temperatures of the rooms.

FIGURE 1.

In 1862 the late Joseph Nason conducted a series of experiments on different classes and different arrangements of heating surfaces, to decide this question. His experiments were conducted within a room kept at a temperature of between 70° and 71°, with steam between atmosphere and one pound, with the smallest movement of air possible; in other words, with a still atmosphere warmed by direct radiation. He found that within this room a wrought iron pipe, one inch in diameter, in a horizontal position, condensed 6.56 ounces of water per square foot of outside surface per hour, the movement of the air being only that caused by the pipe itself.

FIGURE 2.

With a plain and heavy cast iron pipe 3 inches in diameter and 5 feet long, with conditions the same, he found the condensation to be 5½ ounces of water per hour per square foot of outside surface, and with a pipe of the same size and metal, only very much thinner, he found the condensation to be the same.

In his experiments on the same size pipe (3 inches), the surface increased by ⅜-inch ribs, one-half inch from center to center, he found the condensation reduced to 4.4 ounces, but with heavier ribs placed one inch between centers, he found the condensation slightly increased (4.49 ounces). With curved rib cast iron radiator, M. T. & Co., he found the condensation 4.3 ounces; box radiator, cast iron, with straight vertical ribs, 3.63 ounces, and with vertical cast iron pipe rib radiator (7 sections), 3.8 ounces.

With experiments conducted on two of the Nason vertical wrought iron pipe radiators—which may be said to represent all one-inch wrought iron pipe radiators, with pipes 6 feet 2 inches long—he found that single rows condensed 5.7 ounces of water per square foot of surface per hour, but that double rows condensed but 3.93 ounces.

The inference to be drawn from the above is that long pipes stretched around a room have the greatest efficiency, and that short, vertical, plain surfaces in single rows, whether cast or wrought, rank next, and that vertical pipes, or any pipes in close clusters, decrease in efficiency (for direct radiation) in a ratio much beyond popular conception.

Long vertical tubes will not give as high an efficiency per square foot of surface as short ones, in consequence of the warm envelope of air which surrounds themas it goes up; the air's capacity for taking heat from the pipe lessening with its own rise in temperature.

The height of vertical tube radiators as they now exist is a matter of convenience only, and when it is necessary to reduce them one half to go under low window sills, it has been found they are not reduced one half in efficiency.

The radiating power of a radiator may be considered equal to the outside surface of its outside rows of tubes only, and its power to warm air by contact, by the ease and rapidity with which the vertical currents of air can come in contact with the surfaces. Bases, with openings through them, between the vertical rows of tubes, add materially to their value as air warmers.

The diagrams are top views of radiator. Figure 1 showing a radiator ten pipes long by four pipes wide, the pipes in the centre bounded by the dotted lines having comparatively little value. Figure 2 shows the same radiator, with holes through the base, showing whereby close clusters may be made very nearly as efficient air warmers as single rows would be.

The views on this subject above given, and the results of the experiments of Mr. Nason, apply only to direct radiation, the results from warming surfaces being entirely different for clusters with forced circulation, as for indirect radiation. There the surfaces must be massed and finely divided, the height of the radiator depending on the temperatures required within the rooms, and on the velocity of the air.

If the quantity of air moved in a given time is comparatively small, it will be necessary that the temperature at which it enters the room will be higher than when larger bodies of air are moved (the temperatures of the rooms for the time to remain the same) and consequently will require greater heating surfaces, the increase of surface to be in the direction of the height of the heater.

When the quantities of air delivered in a given time are great, the surface must be reduced, so that the heat supplied for the time will be the same.

The heat taken from these coils is almost entirely by convection, the heat radiated being small, and only that amount of it utilized which strikes the metal casing, from which it is then taken by the air which comes in contact with it.

J. H. Mills says, in experiments conducted by him on natural and forced draughts over wrought-iron pipe heaters laid horizontally, that with 66½ square feet of surface with a pressure of steam of 6½ lbs., with the lineal velocity of the air 410 feet per minute, through a 15x14½ opening, that he condensed 9.32 of an ounce of water per square foot of surface per hour, and delivered the air at 138° F., and that, with a velocity of 1,210 feet, all conditions remaining the same, except the steam pressure, which was 5 lbs., he condensed 15.64 ozs. of water, and delivered the air at a temperature of 135° F., the initial temperatures being 84° and 94° respectively.

[TO BE CONTINUED.]

PLUMBERS' PROFITS.

It has been suggested that we reprint an article which appeared in the third number of our first volume on Plumbers' Profits, since many of our present readers have probably never seen it. We have been informed that it has been, on some occasions, of service in securing the payment of disputed bills. We, therefore, here give it:

From THE SANITARY ENGINEER, *Feb.* 18, 1878.

In our last issue we stated under this title that the merchant or banker whose annual transactions are by the million naturally looks upon a gross profit of 30 or 40% on the part of a plumber as something monstrous; yet on a moment's reflection any fair minded man will admit that the margin of profit should be governed entirely by the nature of the business, the amount possible to do safely in a year, and the proportion of expense in doing the business to the amount done. To illustrate: In this city there are about nine hundred so-called plumbers, besides a large number of idle journeymen ready to take any job that offers. The average amount of business done by each firm is not over $10,000 annually, including contract work for builders, jobbing, and days' work. As a rule, contract work pays little or no profit to men who do the work properly and pay for the labor and materials, and it is only taken by good parties to keep extra journeymen employed. Allowing a man to do an annual business of even $20,000, what gross profit should he require to pay his business expenses and have left a living and something to lay by for a rainy day? for every man hopes to make something besides shelter, food, and clothing.

EXPENSES AND LOSSES.

Rent of store, which must be in location accessible to customers who live in best parts of the city	$1,000
Book-keeper and clerk to attend store while proprietor is giving personal attention to work	800
Interest on capital, and sundry expenses doing business, collector, etc	500
Keep of horse, wagon, and boy for driver	500
Bad debts in jobbing business, not counting possible losses through working for speculating builders	500
	$3,300

If these figures are correct, and we believe they are, we contend that 30% average gross profit is not exorbitant, but entirely legtimate. Merchants know that different articles pay varying degrees of profits, and as certain materials used by the plumber are limited to 5% and 10% margin, others must pay more to make up the average. For instance, the proportion between the different rates of profit may be thus represented in tabular form:

$5,000 @ 10%	$500
6,000 @ 25%	1,500
5,000 @ 40%	2,000
4,000 @ 50%	2,000
Yielding gross profit	$6,000
Deduct expenses	3,300
Net profit	$2,700

Few plumbers in this city make $2,700 net annually notwithstanding the hue and cry made about exorbitant profits, and where it has been made we contend it is not too much, considering the hazards of business, for a man to make, who has the intelligence and capability that would render it safe to employ him to attend to such important matters as house plumbing. It is, however, too much to pay ignorant men to do imperfect work, and the public should not employ the latter class and thus curtail the business of the former, making it necessary to obtain an even greater margin on a smaller business.

In this article it is not proposed to insist that any one should pay these profits, but only to show that what in some branches of trade might be exorbitant, is in this business only reasonable, legitimate and necessary, even considering the matter simply from a mercantile standpoint.

LEAD BURNING APPARATUS.

In response to inquiries from correspondents for information about lead burning we have obtained the following description from Mr. Thomas H. Walker, of Kansas City, Mo., of the apparatus of which he is the maker.

KANSAS CITY, MO., *March* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Yours of the 21st is received asking for description of lead burning and apparatus. I herewith send you some hurried sketches and descriptions which I hope will give your correspondents the information they desire; as you know it is impossible to give anything like a detailed description in so small a space. If there is any farther information desired, I will gladly give it.

Fig. 1 is a rough sketch of my improved apparatus complete, as I furnish it ready for operation. *A* is the acid chamber, *B* the generation chamber, *C* stop valve, *D* connecting pipe, *E* trap screw for cleansing and charging, *F* gas cock, *G* emptying plug, *H* dryer, *I* gas conducting hose, *J* burner. The advantages I claim for this machine

Digitized by Google

are, 1st, the pressure can be regulated (to suit the work on hand) from ½ lb. to 6 lbs. per square inch, giving the full range of pressures required for working lead from ½ lb. to 30 lbs. per square foot, also all weights of pipe. I have given the most necessary directions of preparing the work to be learned in the following cuts

Fig. 2 shows the mode of preparing the sheet lead for the ordinary flat butt seam. Fig. 3 shows the manner of preparing the lead for upright seams. In Fig. 4 I have given the appearance of the different kinds of burning, section and plan. *A* is a lapped flat seam, *B* is a butt flat

FIGURE 1.

seam. In these there is a bar of lead used in burning. *C* is a perpendicular upright seam, *D* is a horizontal upright seam, no bar being used in either of these, the operation cutting the lead necessary for the seam from the edge of the overlapping sheet, with the flame.

Fig 5 shows the styles most used for fitting patches. *A*, *B*, *C*, *D* and *E* are of the kind most used—this being where the lower end of patch can be cut through the sheet (see section at the left). *F* is a kind I have employed in making large connections with chambers while in use, by first mounting the connections on the patch, then burning

FIGURE 2. FIGURE 3.

FIGURE 4.

the patch to the sheet before cutting through. *G*, *H* and *I*, are another kind of patch that are not cut through the sheet, but that require a great deal more skill than any of the foregoing, as the lower part is over-hanging, and are the most difficult of any shown. None of these require a bar, the lead necessary being cut from the front sheet with the flame, as in *C*, *D*, Fig 4.

Fig. 6 shows a section of pipe and sheet work in which the pipes are flanged and all seams made with the bar, the pipe being upright and the sheets horizontal.

Fig. 7 shows a section of pipe and sheet work in the same position as Fig. 6, but where the sheets are flanged to receive the pipes, and one end of pipe opened to receive the other; no bar is used, the lead being cut from the flanges to make the joint.

Fig. 8 shows the different ways of doing work on horizontal pipes. The sheets are upright, thus being the reverse of Figs. 6 and 7. *A* shows the manner of fitting where the operator has to work on the side of sheet that pipe leaves. *B* shows the manner where the work must be done on the opposite side of the sheet. *C* shows the

FIGURE 5.

manner of making a joint on a horizontal pipe of small dimensions. The slits are cut and the lead turned back to allow of the lower half being burned inside, then burned through, and the lead worked back into shape. The upper half and the slashes are burned, thus finishing the joint. *D* is the mode employed when the pipe is of large dimensions, where the operator can get inside to burn the lower half, then burn through and finish on the outside.

These are a few descriptions of work that I have done where the nature of the work would not allow of it being

FIGURE 6.

FIGURE 7.

moved. Where the work is small, and can be turned and handled, it is very simple and will not need any description.

I will say here, for the information of those who will ask where I get my oxygen, that I get it at the point of combustion, and can do as much and as good work as with any machine.

FIFURE 8.

In conclusion, I will say that this is a very limited description, but hoping it will give your correspondents and readers the desired information, and be of interest to you and them, I am, Yours, respectfully,

No. 1310 Baltimore ave. THOMAS H. WALKER.

THE PHILADELPHIA PLUMBING ORDINANCE.

We print below the text of the proposed plumbing ordinance for the City of Philadelphia, together with the report of the committee to whom the matter has been referred.

We dislike to criticise details of a measure that, it appears, has been considered by gentlemen who should know what the needs of Philadelphia are; yet there are several points that might be made more clear, and our object in calling attention to them is to have them so framed before it is too late.

Section I. provides for the registration of both master and journeymen plumbers. Section II. requires that a license fee of twenty dollars shall be paid for such license. Is the journeyman to pay twenty dollars license? If not, and we certainly cannot believe that this is intended, it should be so stated, and not left possible to place that construction on the section.

Rule 1, which proposes to look after the qualificatious of plumbers before granting a license, is capable of doing much good if intelligently enforced. A provision in Section V. of the regulations is:

"All house drains or soil pipes laid beneath the cellar floor shall be of proved, tar-coated cast iron pipe, with well leaded and caulked joints; or of first quality hard-burned, vitrified terra-cotta pipe, with joints of the best cement (at the option of the owner, together with the approval of the Department)."

It then provides that all other drain pipes, or "where pipe is above the cellar floor, shall be tar-coated cast iron pipe, carried ten feet outside house walls," and in Section VI. we find that "the house drain must have a fall of not less than ⅛ of an inch to the foot. It shall run along the cellar wall, unless this is impracticable."

Now, this latter clause is sound and should be adhered to. We imagine that there can be few houses to be erected in Philadelphia where it would be impracticable to place the drain above ground in the cellar; indeed, this should be a cardinal rule, and the burying of a drain beneath a cellar bottom should be absolutely prohibited.

One reason given to us for not following New York in these regulations requiring drains inside a house to be exposed, is "that the sewers in New York are not sufficiently below the street surface to admit of a drain buried below the cellar bottom, consequently, they had to be placed on the wall; but "in Philadelphia a buried drain could readily be connected at proper grade with the sewer."

This is a great mistake. In New York the sewers are, as a general thing, laid at greater distance from surface than those in Philadelphia. The real reason for the New York rule is that experience has shown that only the speculative builders want to put down the tile drain *inside a house*, because they can employ laborers to do it, cover it up, and save a few dollars; but sooner or later the future owner or occupant of the house is compelled to dig up this drain, which is almost invariably found to be leaking, and go to the expense of putting in an exposed iron one, which requires skilled labor to put up, and in which defects, if they exist, can be detected. That is the one and only reason.

In any case where special circumstances require that the drain be placed below the cellar bottom, the following clause in the New York Rules better meets the case than Section V.:

"4. The house drain must be of iron, with a fall of at least one-half an inch to the foot, if possible.

It should run along the cellar wall, unless this is impracticable, in which case it should be laid in a trench cut at a uniform grade, walled up on the sides and provided with movable covers, with a hydraulic concrete base of four inches in thickness, on which the pipe is to rest."

This burying of a drain pipe inside the four walls of a house cannot be too strongly opposed. If this law is for the benefit of the occupants of the houses to be hereafter erected in Philadelphia, and we fail to recognize any other legitimate reason for its enactment, and if their safety is to be considered, the "option of the owner" clause, it strikes us, should be stricken out, since it is clearly for the benefit of the bonus builder. We imagine that at this day few, if any others, will avail themselves of it, and his is certainly the last interest to be considered in an ordinance like this. His purpose is to build as many houses as he can and dispose of them; sanitary plumbing being the last thing that concerns him.

We believe that with many Philadelphia houses it is possible to lay a house drain outside a house, there being vacant space between the houses. If that be so, the use of vitrified pipe below ground should be confined to such

Digitized by Google

cases, but under no circumstances should it be permitted *inside* a house. There is not a plumber of the seven composing the Committee of Twenty-one but well knows that not one tile pipe drain in five laid below ground in Philadelphia houses is tight; that with the present knowledge on the subject, its future use inside houses will be mainly by *bonus* builders, and that no inspection which Philadelphia will be likely to have, can ensure the laying of this pipe so that it will be tight.

No, gentlemen! if you want to protect the people who are to live in *bonus* houses, strike out this option clause, and insist that a drain in a house shall be exposed or easily accessible, but in no case buried.

In Section XIII. the words "except where the supply of water is assured" should be stricken out. No such assurance can be safely made in Philadelphia at this time.

Sections XVII. and XVIII. are capital. Philadelphia has had the benefit of the experience of other cities, and we congratulate the gentlemen whose labors have produced the bill we have commented on. We trust they will be able to act on the suggestions herein made, and that the bill may speedily become a law, even if our views are not entirely concurred in, for we regard it as a good move, and in the right direction.

PHILADELPHIA, *March*, 13, 1883.

To the Select and Common Councils of the City of Philadelphia.

Gentlemen:—We, your Committee on Surveys and Regulations, to whom was referred the accompanying communication and ordinance, regulating Plumbing, and House drainage, Registration and Licensing of Plumbers, beg leave to report, that they have held several meetings and visited New York and Brooklyn, where there is municipal control of these matters, they carefully examined their laws and those of several other cities, and for the purpose of a thorough knowledge of our local requirements, invited the co-operation of a Committee of Twenty-one, composed of plumbers, architects, and physcians, who after numerous meetings, reported to us a complete set of regulations. We think that public health demands a thorough supervision on the part of the City. We submit the annexed ordinance and regulations, and recommend the passage thereof.

CHARLES LAWRENCE.

AN ORDINANCE.

To regulate the Plumbing, House drainage, Registration, and Licensing of plumbers in the City of Philadelphia.

SECTION 1. *The Select and Common Councils of the City of Philadelphia do ordain*, That on or before the first day of July, 1883, every master or journeyman plumber, carrying on his trade in the City of Philadelphia, shall and must, under such rules and regulations as are herein prescribed, register his name and address, with and at the Survey Department of said City, and after the above date it shall not be lawful for any person to carry on the business of Plumbing in said City, unless his name and address be registered as provided, and he or they shall have procured a license for the same.

SEC. 2. Each and every person or firm shall, before obtaining said license, pay to the Survey Department the sum of twenty dollars, and upon the payment of said sum he shall receive from the above Department a license to carry on said business from the above date for the term of one year. Each and every license must be renewed on or before the first day of July, in each and every year.

SEC. 3. The Chief Engineer and Surveyor shall appoint eight inspectors, to be approved by Select Council, whose duty under and subject to his direction shall be to examine all plumbing and house drainage work, and if the same be in accordance with the rules and regulations, herein contained, he shall give certificate of approval, a copy of which shall be filed in the Department.

SEC. 4. A list of the registered plumbers of the City of Philadelphia shall be published at least once in each year, the time and paper to be named by the Committee of Councils on Survey.

SEC. 5. The expenses of this branch of the Survey Department shall be paid from the fees received for licenses. All blanks, forms, plans, and specifications to be furnished by this Department, and no charge made therefor, and no expense to be entailed on any person other than the fee for the license, all fees for license to be paid into the City Treasury, and Councils shall make such appropriations as may be necessary for the carrying out of this ordinance.

SEC. 6. The salaries of the Inspectors shall not exceed one hundred (100) dollars per month, or more than the revenue received from license, and so much of said revenue is hereby appropriated as may be necessary for the payments herein provided for.

SEC. 7. Any person or persons violating any of the provisions of this ordinance, or of the rules and regulations contained therein, shall be deemed guilty of a misdemeanor, and shall be subject to a fine of twenty (20) dollars for the first offence, fifty (50) dollars for the second offence, and for subsequent offence, forfeit his or their license, said fines and penalties to be collected by due process of law, prescribed for the collection of like penalties.

RULES AND REGULATIONS.

I.—*Registration and Licensing of Plumbers.*

RULE 1. Every person engaged or about to engage in the plumbing business in the City of Philadelphia shall appear in person at the office of the Survey Department for examination as to his qualifications as a plumber, and if found competent he shall be registered and receive a license; and no person other than a licensed and registered plumber shall be allowed to carry on or engage in the plumbing business or make any connection with any sewer, drain, soil, or waste pipe, or any pipe connected therewith.

RULE 2. Each license must be renewed during January of each year, and it shall be the duty of every plumber to give immediate notice of any change in residence or place of business, for the correction of the Register.

RULE 3. Any plumber violating the rules of this Department shall be liable to a fine of twenty (20) dollars for the first offence; fifty (50) dollars for the second offence, and for any subsequent offence shall forfeit his license at the discretion of the Department; and any other person so offending shall be liable to a fine of not less than twenty-five (25) dollars nor more than one hundred (100) dollars, to be collected upon the complaint of any citizen before a magistrate.

II.—*Plans and Specifications.*

The plumbing and drainage of all buildings, public and private, shall be executed in accordance with plans and specifications previously approved in writing by the Survey Department; and suitable drawings and descriptions of the said plumbing and drainage shall, in each case, be submitted and placed on file in the Survey Department, said drawings and descriptions to be furnished by the architect or builder where one is employed; any application for a change in plan must be made in writing by the owner or his authorized agent.

Drawings and descriptions of the plumbing and drainage of buildings erected prior to the passage of the act may be placed on file in the Survey Department.

Blank specifications for plumbing and drainage will be furnished on application at this office.

As the law requires that the plumbing and drainage be executed according to a plan approved by the Survey Department, the work must not be covered or concealed in any way until after it has been examined by an inspector of the Survey Department; and notice must be sent to the Survey Department when the work is sufficiently advanced for such inspection.

When the plumbing or drainage of buildings erected prior to the passage of this ordinance has been inspected and condemned, plans must be filed and the new work or alterations shall be executed in accordance with the rules and regulations.

III.—*Qualtity of Material and Workmanship.*

All materials shall be of good quality and free from defects; and the work must be executed in a thorough and workmanlike manner.

IV.—*Inspection.*

All soil or waste pipes before being connected with fixtures shall have openings stopped and the peppermint test (or such other test as the Department may require), applied for inspection.

The drain, soil and waste pipes, and the traps, shall, if practicable, be exposed to view for ready inspection at all times, and for convenience in repairing. When placed within walls or partitions and not exposed to view, or covered with woodwork, fastened with screws, so as to be readily removed, or when not easily accessible, extra heavy pipes shall be used at the discretion of the Department. In no case shall they be absolutely inaccessible.

It is recommended that while building, recesses shall be left in the walls for all soil or waste pipes of 3 inches or over.

V.—*Material of House Drains.*

The main drain of every house or building shall be separately and independently connected with the street sewer, or with a main of sufficient capacity, at the discretion of the Department. All house drains or soil pipes laid beneath the cellar floor, shall be of proved tar-coated, cast-iron pipe, with well leaded and caulked joints; or of first quality hard-burned vitrified terra cotta pipe, with joints of the best cement (at the option of the owner together with the approval of the Department). All other drain, soil, or waste pipe connected therewith, or where main drain pipe if above the cellar floor properly secured, shall be of tar-coated cast-iron pipe, carried 10 feet outside of house walls or five feet beyond vault, if any.

VI.—*Arrangement and Ventilation of House Drains.*

The house drain must have a fall of not less than one-eighth of an inch to the foot.

It shall run along the cellar wall, unless this is impracticable, in which case it shall be laid in a trench cut at a uniform grade.

The arrangement of soil and waste pipes shall be as direct as possible. All changes in direction shall be made with curved pipes, and all connections with soil or waste pipes shall be made with Y-branches and one-eighth bends.

It shall be provided with a running trap placed at an accessible point inside of cellar wall nearest to the sewer. The trap shall be furnished with a hand hole for convenience in cleaning, the cover of which shall be properly fitted and the joints made tight with some proper cement.

There shall be an inlet for fresh air entering the drain just inside the trap, or at the rear end of system, of at least 4-inches in diameter, leading to the outer air and opening at any place not too near a window.

VII.—*Construction of Vertical Soil and Waste Pipes.*

Every vertical soil pipe shall extend at least two feet above the highest part of the building or contiguous property, of undiminished size, properly hooded or capped. They shall not open near a window nor an air-shaft ventilating living rooms.

Where a separate line of waste pipes are used, not connected with sewer pipes or cesspool, they shall also be carried 2 feet above the highest part of the building or contiguous property. There shall be no traps on vertical soil or waste pipes.

VIII.—*Quality and Weights of Soil Pipes.*

All drainage or ventilating iron pipes shall be sound, free from holes, and of a uniform thickness of the following standard weights:

2 inches,	3½ pounds	per lineal	foot.
3 "	4½	"	"
4 "	6½	"	"
5 "	8	"	"
6 "	10	"	"
7 "	13	"	"
8 "	16	"	"
10 "	25	"	"
12 "	37½	"	"
15 "	45	"	"

And for large buildings the use of what is known as Extra-Heavy Soil Pipe is recommended, which weighs as follows:

2 inches,	5½ pounds	per lineal	foot.
3 "	9½	"	"
4 "	13	"	"
5 "	17	"	"
6 "	20	"	"
7 "	27	"	"
8 "	33½	"	"
10 "	45	"	"
12 "	54	"	"

Before they are connected they shall be thoroughly coated inside and outside with coal tar pitch, applied hot, or some other equivalent substance.

IX.—*Joints and Connections.*

All joints in the cast iron drain, soil, and waste pipes shall be so caulked with oakum and lead, or with cement made of iron filings and sal-ammoniac, as to make them impermeable to gases.

All connections of lead with iron pipe shall be made with a brass sleeve or ferrule, put in the hub of the branch of the iron pipe and caulked in with lead, except in cases of iron water closet traps or old work when drilling or tapping may be necessary. The lead pipe shall be attached to the ferrule by a wiped joint.

All connections of lead pipe shall be by wiped joints.

X.—*Traps.*

Every water closet, sink, basin, wash-tray, bath, and every tub or set of tubs, shall be separately and effectively trapped. The traps must be placed as near the fixtures as practicable. All waste pipes shall be provided with strong metallic strainers. All drains from hydrants shall be trapped below frost, and in a manner accessible for cleaning out.

XI.—*Air Pipes.*

Traps shall be protected from syphonage by a special air pipe, not less in diameter than the waste pipe; if it supply air to a water closet trap, not less than two inches in diameter, the size to increase with the number of water closets. All container water closets must be supplied with fresh air and be properly ventilated as approved by the Department.

Every vent pipe shall be of lead, of galvanized gas pipe, or of cast-iron pipe, tar coated.

These pipes shall either extend two feet above the highest part of the building of contiguous property, or they may be branched into a soil pipe above the inlet from the highest fixture. They may be combined by branching together those which serve several traps. These air pipes must always have a continuous slope, to avoid collecting water by condensation.

XII.—*Drip or Overflow Pipes.*

All drip or overflow pipes from safes under wash basins, baths, urinals, water closets, or other fixtures, shall be by a special pipe run to some conspicuous point; and in no case shall any such pipe be connected with a soil, drain or waste pipe.

No waste pipe from a refrigerator, or other receptacle in which provisions are stored, shall be connected with any drain, soil, or other waste pipe. Such waste pipes shall be so arranged as to admit of frequent flushing, and shall be as short as possible, and disconnected from the refrigerator.

The overflow pipes from tanks shall discharge into an open-trapped fixture, or into the bowl of the water-closet itself, not into the soil or waste-pipe, nor into the drain or sewer.

XIII.—*Water-Closets.*

Every water-closet, or one line of water-closets on the same floor, shall be supplied with water from a special tank or cistern (the water of which is not used for any other purpose), except where the supply of water is assured. When the pressure in the water main is not

Digitized by Google

sufficient to supply these tanks, a pump must be provided.

Water-closets must not be located in the sleeping apartment of any building, nor in any room or apartment which has not direct communication with the external air either by a window or an air shaft, having an area to the open air of at least four square feet.

XIV.—*Cisterns.*

Cisterns for drinking water are objectionable. If decided indispensable by the Department, they shall be constructed of iron or of wood. The overflow shall discharge into an open-trapped fixture, never into any soil or waste pipe, or water-closet trap, nor into the drain or sewer.

NOTE.—Water-tight brick cisterns built underground for drinking purposes are not included.

XV.—*Rain-Water Conductors.*

Rain-water conductors must never be connected outside of main trap, or used as soil, waste, or vent pipes; nor shall any soil, waste, or vent pipe be used as a conductor. When connected with the house drain or sewer, the conductor shall be trapped beneath the ground with a deep seal, to avoid evaporation; and if placed within the house, shall be made of cast-iron, with leaded joints.

XVI.—*Steam Waste.*

No steam exhaust or waste from steam pipes shall be connected with any house drain or soil pipe.

XVII.—*Cesspools.*

No privy vault, or cesspool for sewage, will be permitted in any part of the city when a sewer is provided in front of the property lines, and no connection from any cesspool or privy well shall be made with any sewer or drain pipe.

XVIII.—*Cellar Drains.*

No opening will be allowed in the sewer pipe of any building for the purpose of receiving the surface drainage of the cellar, unless special permission is granted, and any opening so made must be immediately and permanently closed when directed by the Department.

Correspondence.

PLUMBERS' PROFITS.

WORCESTER, MASS., *March* 28, 1883.

To the Editor of THE SANITARY ENGINEER:

It is some time since I noticed any communication from this section in your paper in regard to plumbing matters. Thinking it might be of interest to your readers, I send the following:—

I am surprised to find among my customers, outside of professional men and members of the trade, such a large number of readers of your paper, and I think the plumbers owe, and should be willing to acknowledge, the improvement and high standard in our business to its influence.

During the hard times a large share of our business was done by contract, and generally through a second party, namely, the builder. In this way the owner rarely got what he expected. Sometimes he blamed the carpenter, but almost always he would claim that the fault was the plumber's. It was certainly very unsatisfactory all around, and I am glad to be able to say now that this manner of doing things is changing more and more every year, so that now if a party is going to build he has the plumbing left out of the carpenter's contract, and deals directly with the plumber. We also have a great deal more day work than formerly, and in remodelling all work is done by the day. This has become an important branch in our business, and, as I said before, it is due to the education of the public as to the importance of sanitary plumbing.

I hear of complaints in different sections that the plumbers can't get a profit on material. I never experienced any such difficulty here, and I would say to those who are making such a cry about protection, that the remedy lies with themselves, and that is, to stop trading with dealers who sell to consumers at wholesale prices.

E. A. MOODY.

[We are pleased to receive this testimony, and especially at a time when there are complaints that the plumbing business is getting demoralized. We shall be glad to get the views of others of our readers in various parts of the country on this subject, for we are under the impression that Mr. Moody's experience has been that of many other gentlemen in the plumbing business].

WINDOW VENTILATORS.

PACKET COLL. INST.,
BROOKLYN HEIGHTS, *March* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

One of the teachers of this institution has applied to me to know whether any improvements have recently been introduced in methods of continuous window ventilation. The method by introducing into the sash a revolving fan is of course familiar. Some one patented, a few years ago, a device for "filtering" the air which is permitted to pass through wire gauze at the base of a window, allowing a constant, gentle draft, free from dust, or by substituting muslin, free from moisture to some extent if the muslin be changed from time to time.

This latter method was introduced into one or two schools of New York City by joint recommendation of my friend. Dr. W. Gill Wylie (40 W. 40th st,) and myself. Dr. Wylie suggested to me yesterday to write you on the subject. If you can kindly refer me to any articles containing an account of further improvements, I shall esteem it a favor.

Very respectfully, yours,
W. LE CONTE STEVENS.
Acting Prof. Physics, Packer Institute.

[There are many devices for securing ventilation by windows without producing unpleasant draughts, the principal of all being the same—viz., to direct the incoming current of air upwards towards the ceiling by means of a deflecting plate. Wire gauze and coarse muslin are used in many of these contrivances, to keep out dust, flies, etc., and to break up the incoming air into fine streams, and thus avoid draughts.

The latest patents of this kind we have seen are that of J. G. Bronson (No. 270,733, dated Jan. 16, 1883), for an extra sash or deflector plate—and that of Sarah B. Stearns (No. 271,146, dated Jan. 23, 1883), for a deflecting plate with a gauze or cloth strainer. Copies of the specifications and drawings for these patents can readily be obtained from the patent office in Washington, or from this office.

The practical working of such contrivances depends on the mode in which the room is heated, on the presence of an open fireplace or special foul air flues, on the external temperature, and on the direction and force of the wind. As adjuncts to a properly arranged system of ventilation they are convenient and useful, but it is a mistake to rely upon them solely to secure ventilation in a room containing a number of persons, as, for example, in a school room.

Some additional particulars about simple means of window ventilation are given in the abstracts of Dr. Lincoln's paper on school houses in THE SANITARY ENGINEER, Vol. VI., p. 186, and by Dr. J. S. Billings, Vol., IV. p. 130.]

REMOVING VAPOR FROM DYE HOUSE.

HAMILTON, ONT., *March* 20, 1883.

To the Editor of THE SANITARY ENGINEER:

Could you inform me the best way to take steam out of a dye house? It is easy enough to do this in the summer by opening the windows and letting it blow out, but in the winter the cold air prevents it coming out.

It has been tried to draw it out with a fan, but it does not answer the purpose. The fan, of course, draws out the air, but leaves the vapor in the house. We have also tried to ventilate the steam through the roof by artificial heat, but with the same result as the fan. If you can get this information, or should any further information be required, if you will communicate with us by letter you will confer on me a very great favor. I am,

Yours respectfully, DONALD MCPHIE.

This is a dye house for a hat factory, and the steam is of a very wet nature, consequently like a vapor, and not like the ordinary steam from a boiler.

[We think a properly arranged fan would do more to remove the vapor from the room than any other means, excepting, perhaps, an aspirating shaft of large dimensions and high, with heating surfaces within the shaft, arranged with a view to getting the greatest results from the smallest quantity of heating surface.

In any case, provision must be made for admitting as much air, and as fast as the fan or aspirator is capable of drawing it out.

The air is the vehicle which holds the steam or vapor in suspension, and when the air becomes surcharged, the vapor being the lightest, the superabundance will be found near the ceiling, so that whether a shaft or fan be used, the air must be drawn from the top.

A way to remove moisture from the air of a drying room, without changing the air, is to condense it against pipes, placed at the upper part of the room, through which cold water is circulated.

Troughs are arranged under these pipes to receive the water so formed and conduct it without the house.

Professor Wm. P. Trowbridge, of Columbia College, in a paper read at the first regular meeting of 1882 of the American Society of Mechanical Engineers, says: "There seems to be no doubt that steam coils properly devised and adapted to chimneys or flues, will give a more efficient ventilation than the blower, for less cost of construction and maintenance." He also says: "The arrangement of the steam pipes in such a manner that the greatest amount of heat will be transfered to the air with the least resistance to its motion, is a matter of importance," and he suggests that a flue may be divided into smaller flues at its base with sheet iron diaphragms, between which the vertical pipes should be placed, as shown in the diagram.]

FIGURING AMOUNT OF HEATING SURFACE.

FLINT, MICH., *Jan.* 29, 1883.

To the Editor of THE SANITARY ENGINEER:

I have Baldwin's Steam Heating for Buildings, of 1881, published by J. Wiley & Son, but the rule on pages 23 and 24 I do not quite understand. If not too much trouble, will you please make it a little more explicit? For example, publish the figures and method of figuring on the following room, 19′ x 13½′ x 12′ ceiling; lath and plastered on brick wall, with 1½ furring between wall and laths. Three south windows, 3½ x 8 feet, or 28 square feet to each window. Same sized room with plaster on brick wall. The above will be kindly read.

Respectfully yours, F. C. H.

[You do not say how many outside walls there are to the room you specify; but as there are three windows, we assume the longest side (19 feet) to be the outside wall. The inner walls, ceilings and floors you may omit on the assumption the other rooms of the building are warmed. Thus we have 19 x 12 = 228, less the window's area (84 square feet) = 144 square feet of outside wall, which, multiplied by 75 and divided by 1,000 = $11\frac{8}{10}$, or the equivalent of the wall surface in square feet of glass for the lathed and plastered room, or the same (144) x 125 ÷ 1,000 = 18 for the unlathed.

Thus we have in the first case $84 + 11\frac{8}{10} = 95\frac{8}{10} \times .5 =$ 47.9 square feet of radiating surface for the first room, and 84 + 18 = 102 x ½ = 51 square feet for the second room; to both of which should be added a generous allowance of surface to warm the air admitted for ventilation or leakage, if any.]

APPARATUS FOR EMPTYING CESSPOOLS.

NEW YORK, *March* 27, 1883.

To the Editor of THE SANITARY ENGINEER:

Can you tell me where I may get a pneumatic cart or "excavator" for emptying country cesspools, and sprinkling sewage in fields? Yours faithfully,

C. R. AGNEW.

[We refer this inquiry to our readers.]

WATER IN BOILERS.

ST. LOUIS, *March* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

What would be the condition of the water in a boiler used continuously, over and over, without any new water being added, said boiler being used for a gravity return heating apparatus? Would it be dangerous?

No. 1,925 Olive st. A. H. GOFF.

[We do not understand what danger you particularly refer to. The only salt deposited to any extent in the boiler would be carbonate of lime, for there would always be enough water in the boiler to hold the soluble salts in solution. The water returning from the radiators is practically distilled water, and contains no salts.

HOT WATER RADIATOR.

ST. JOHN, N. B., *March* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Do you know of a hot water radiator for use in private dwellings, in place of box coils for house heating by hot water? If so, kindly inform us. In your issue of May 4, 1882, the description of the hot water apparatus of J. H. Baldwin, M. D., is very incomplete, and the form or style of apparatus such as we would not care to construct.

Hot water heating is largely used in our city, and has proved highly satisfactory and very economical of fuel. We construct a low pressure hot water heating apparatus, open to the atmosphere, for private dwellings, and must say we prefer it to steam for that purpose, although we put in low pressure steam gravity apparatus, working at one-inch pressure, also. But the universal opinion here is in favor of hot water for private residences, and steam for large buildings, schools, public halls, etc.

Yours very truly, J. A. FISH,
41 Dock street.

[Some of our readers can doubtless give Mr. Fish the desired information.]

Digitized by Google

74 St. Mary's St., Toronto, Can., *March* 17, 1883.

To the Editor of The Sanitary Engineer:

I would like to draw your attention to one or two points which I noticed in late numbers of The Sanitary Engineer, which appeared to me to be slight errors, viz—on page 221 of the issue of Feb. 8, there is a note of the City of Birmingham Eng., taking proceeding against certain towns above it on the River Thames (?) etc, etc,.

If the town *is* Birmingham the river can hardly be the Thames, as the Thames rises in the Cobswolds Hills, about 60 miles due south of Birmingham, flowing for some miles southeast and then east; the Cobswolds Hills and the River Avon lying between Birmingham and the Thames.

Then in the issue of Feb. 22, on page 274, note "Regina, N. S." (?) Regina is in the N. W. T. of Canada, being the capital of the new province of Assiniboin in the North West Territory.

In the same issue, on page 269, is an illustration showing the plumbing of a London residence, is not the position of the vent pipe from the W. C. under street totally inadmissable? through its being connected with the vent pipe of the main trap on the sewer, or street side of trap, and thus bringing the sewer gas of main sewer into direct connection with the house system of drains!

My experience of plumbing and drainage in England is, that it is the very rare exception to find these vent pipes from crown of traps, and I think the by-laws of the various cities will bear me out in this, not excepting "the model by laws" issued by the Local Government Board.

Yours faithfully,

J. Hargrove Rainey, *Assoc. S. Ind. Eng.*

[We published the illustration just as we received it, and did not notice the pipe referred to which if joined, as seems to be the case, is open to the objection pointed out by our correspondent.]

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

[One of the last labors of the late Robert Briggs was the preparation of a paper on the history and progress of steam heating in the United States, for the English Institution of Civil Engineers. The paper was read after the author's death, at the meeting held November 28, 1882, and has peculiar interest from his almost unrivalled acquaintance with the development of steam heating in this country.

We shall publish full extracts of the paper.]

The application of steam to the warming of buildings in the United States originated with the late Mr. Joseph Nason, of Boston and New York, who died six or seven years ago. He was not only the first to make the attempt, but was also the originator, improver and adapter of much that is essential, and now implicitly followed, in the general arrangements and details of the apparatus employed. He enjoyed the advantage of having been for a short time a pupil of Jacob Perkins in London, about 1840; and his earliest endeavor in America was to adapt the Perkins system of hot water inside small tubes for meeting the severity of the climate of America. The large extent of warming surface and the great strength presented by steam apparatus constructed of small and comparatively inexpensive wrought iron tubes, and the facility thereby afforded for transmitting heat in any direction from a central source, are merits which led to so rapid a development of this system of warming, that by 1860, or in less than twenty years, there were already many hundred establishments throughout America for the manufacture of the apparatus. With the maturing of the system are associated the names of Mr. J. J. Walworth, of Boston, brother-in-law and partner of Mr. Nason; Mr. Gregg, of New York; Mr. J. O. Morse, of New York, by whom, among other improvements, was introduced the method of closed circulation for working with steam below atmospheric pressure; Professor Mapes, of New York, who supplied a reliable steam trap; Mr. Miles Greenwood, of Cincinnati, to whom the author believes the arrangement is due of a coil or nest of tubes connected by return bends; and Mr. Thomas T. Tasker, of Philadelphia, who introduced the first closed apparatus. For himself, the author may claim to have established certain characteristic shapes and dimensions now universally adopted for the "globe" stop-valves and for the fittings or couplings of the tubes.

Wrought-Iron Welded Tubes.—In the construction of the apparatus for warming by steam, the prevailing practice in America is to employ wrought-iron welded tubes, not only for the mains, but also to a large extent for the radiating surfaces that diffuse the heat. The separate lengths of tubes are connected by wrought-iron couplings, when in the same straight line; and when not so, by cast-iron elbows, tees, branch-pieces, and return-bends. The so-called coils or radiators usually employed for diffusing the heat are compact nests of tubes, sometimes arranged vertically by having their bottom ends screwed into a cast-iron box, and at other times placed horizontally and connected together by branch-tees and return-bends.

In the use of these tubes, the essential feature of practical importance is the employment of tapering screw-threads, externally upon the tube ends and internally within the sockets of the couplings or fittings, as the means of securing durable steam-tight joints which can be readily made or unmade. The system of taper screw-threads for the tube connections is believed by the author to have been originated by Mr. Nason, with whom he became associated in 1846; at that time the threads were cut in a lathe.

Where any two metallic surfaces are to form a steam-tight joint, they must be brought together into complete contact, either with each other or with some elastic or yielding packing interposed between them; and the force compressing them together must be sufficient both to obliterate any inequalities in the surfaces themselves, and also to withstand any internal pressure tending to part them. In the case of the machine-finished surfaces of the external and internal taper screw-threads forming the tube joints, the required contact is no doubt mainly affected by yielding of the metal of the tube under compression of the socket under tension; while the thread itself serves to maintain the joint against the internal disruptive steam-pressure.

A screw-thread, either external or internal, cut or tapped by means of the usual workshop appliances, is far from possessing absolute accuracy in radius, either for the top of the thread or for the bottom of the groove; and presents also the defect known as "drunkenness," or want of uniformity in its inclination or pitch. In making a steam-tight joint, these imperfections have to be overcome by the application of force. The thread has also defects in angular form, arising from imperfections in the dies or taps, and from the metal having been torn instead of being cut clean in the formation of the thread. These defects are remedied by the use of a paste, made of white lead ground in linseed oil and mixed with about an equal quantity of dry red lead. This material acts both as lubricant and as packing in making the joint; it fills all interstices in screwing the joint up, and sets hard on the first application of steam heat, or within a short time if left cold.

The leverage of the pipe-tongs or wrench, employed to screw the tube up, is largely multiplied by the action of the screw itself in converting the force into the longitudinal direction; and the tube end being moreover shaped as a conical plug of slight taper, the longitudinal force results in a greatly intensified pressure of contact between the threads of the tube and its socket. For example: the ordinary pitch is 11½ threads per inch for a tube of one inch nominal diameter inside or 1.31 inch actual diameter outside, and the taper of both the tube end and the inside of the socket is one in 32 to their axis. After the tube has been entered into the socket as far as it can readily be screwed up by hand, one quarter turn more with the pipe-tongs is generally sufficient to make the joint steam-tight. In this quarter turn of the tube the difference of diameter is in the ratio of one, 11½x16x4, and is therefore equal to 1-736th of an inch. Meanwhile the hand, acting on the tongs at a radius of usually about 16 inches, will move through an arc of 25 inches, giving thus an effective leverage of say 18,000 times. The bursting pressure thereby produced within the socket, or the compression upon the tube end, is concentrated on about one-half inch length of the socket or tube, and the mean diameter is there about 1¼ inch; whence the pressure per square inch tending to burst the socket is roughly about 11,000 times the manual force exerted on the tongs, if the frictional resistance to turning be neglected.

In practice it is really by the frictional resistance to turning that the limit of bursting strain actually thrown upon the cast-iron socket in screwing up is determined. For supposing the limit be taken to be a radial pressure of say 5,000 lbs. per square inch, it is seen from the foregoing that, after overcoming the frictional resistance to turning, an insignificent one-half pound would be all the extra force required on the pipe-tongs for throwing this great bursting strain upon the socket. Allow now 15 per cent. as the co-efficient of friction—a value not unreasonable when it is borne in mind that points of metal are brought into contact, and that the great pressure between them destroys the continuity of the imperfect lubricant. Then neglecting the screw-thread, and regarding the tube end and the casting as a plain conical plug and corresponding socket, the resistance to turning, offered by the one-half inch length of tube-end of 1¼ inch diameter is 5,000 x 0.15 x 3.1416 x 1¼ x ½ = 1,400 lbs., acting at a radius of ⅝ inch, which is equivalent to about 55 pounds exerted on the handle of the tongs of 16 inches radius. A skilled workman judiciously keeps well within this limit in the force which he exerts; and the cast-iron fittings being made according to the proportions hereafter given, the thickness of metal left outside the thread after tapping them is amply sufficient to stand the tensile strain so exerted, which rises probably to 10,000 or 12,000 pounds, say five tons per square inch of section of metal. In practice, moreover, it is found that a joint can safely be screwed up with the tongs through even one whole turn, instead of only a quarter turn; the wrought-iron tube-end yields permanently under the compression, while the limit of elasticity of the cast-iron socket is not exceeded, and hence neither metal has its strength impaired. Complete facility is thus afforded for leading off bends or branches in any desired angular position,

E. G. LOVE, Ph.D., *Gas Examiner.*

"A VALUABLE DISINFECTANT FOR SEWERS."

Under this heading the *Water Gas Journal* says:—

"It has been discovered that the best disinfectant for sewer gases is the washings from gas works. This serves a double purpose, that of annulling the poisonous effect of the sewer gas, and at the same time enabling persons having defective traps to detect it by the strong, pungent odor arising therefrom, while sewer gas alone, almost odorless, permeates the building, carrying sickness and death with it. The washings from water gas works, at least, will not clog or obstruct even the smallest of sewers, while their presence, as above stated, might save valuable life."

We cannot endorse these views, for several reasons. We are somewhat in doubt as to what is meant by "washings from gas works," but it is reasonable to suppose that it includes all the liquid refuse matter, tar, ammoniacal liquor, etc.

1st. The liquid refuse from gas works would not disinfect sewer gases. Their odor might be partially or entirely disguised, but this is a long way from disinfection. To be sure, if a disease germ were well soaked in ammoniacal liquor, or thoroughly smeared with coal tar, its future usefulness would be very seriously impaired; but no such desirable end would be reached by letting this refuse flow into the sewers. The difficulty is in bringing the germ in actual contact with the so-called disinfectant.

2d. The tar would most certainly obstruct the sewers, although the ammoniacal liquor might not. The tar would settle and mix with the other refuse washed in from the street, not materially improving the job of the person who, from time to time, is obliged to shovel it out.

3d. The tar and liquor are too valuable to be thrown away. The latter yields valuable ammonia salts, while the former is the source of our most important dyes. Together they can be made to pay a considerable portion of the cost of the material used in the manufacture of gas.

L.

THE STORAGE OF ELECTRICAL ENERGY.

Professor George F. Barker, of the University of Pennsylvania, delivered a highly entertaining lecture on the above subject last Friday evening, before the Chemical Society of the School of Mines, Columbia College. Besides the members of the society and other students and professors of the school and college, there were present representatives from the principal electric light companies, and many others interested in electrical science. Long before the beginning of the lecture all the seats were taken and many stood throughout the whole two hours, or more, in which the lecturer entertained his audience.

Digitized by Google

The magic lantern was used to illustrate forms of apparatus not at hand, and to show experiments, which otherwise the whole audience could not have seen. From the centre of the ceiling hung a handsome electrolier of novel pattern, with peculiar shades of colored glass, loaned by Mr. Edison. The six Edison lamps which it contained were supplied with current from a Faure storage battery of 28 cells, loaned by the Light and Force Company. These lamps furnished the entire illumination for the room.

The first part of the lecture was a review of the progress of the knowledge of electricity since the earliest experiments of Galvani and Volta. In commencing the subject proper of his lecture he began at the first principles of mechanics, and defined and illustrated by means of specially arranged apparatus, the meaning of "work" and its mechanical measure and "energy," both of motion and position. Storage of energy was defined to be "the conferring upon a body the power to do work in virtue of a change in its position" and "whenever two attractive bodies are separated, energy is stored up." The speaker would not like to have the subject of his lecture reported as "the storage of electricity," as it had been announced. It was not electricity that was stored up in these cells, but energy. "If I use a steam engine" (to lift a weight which he had raised) "I should not say I had stored up steam power, or if I use the muscle of my arm, I do not store up muscle. What I have stored up is energy, and energy is all you can store up."

Chemical decomposition by means of the electric current was illustrated, and polarization explained as the basis of the principles of the storage battery. Planté constructed secondary batteries thirty years ago. They consisted of cells of lead plates in a solution of one part of sulphuric acid to ten parts of water. The result is a growth of lead oxide on the positive plate and metalic lead on the negative, the product of chemical decomposition. By this means electrical energy is stored up, and is given out on chemical re-union. The more recent discoveries of Faure have given an improvement on this method. He found that instead of waiting for the formation of the peroxide of lead it could be placed beforehand on the plates, thus shortening the time required for the storage of a secondary battery from three months to a hundred hours. Specimens of the plates were shown. The red lead was kept on the plates, after being spread over them, by parchment covered with felt, and the plates afterwards punctured with holes about an eighth of an inch in diameter and half an inch apart.

Electrical energy could not be stored without loss, for no human machine was perfect. Still the storage battery had its place and was destined to come into very general use.

One of the exhibits which seemed most to interest the audience was that of a little lamp designed to be used at the Vandebilt ball in the head-dress of a lady. It was not used because it was found when too late that the resistance of the lamp was too great for the little battery. Three of the latter were connected with perfect success with one lamp, which continued to blaze till the close of the lecture. Other curiosities shown were one of the original plates brought over from France in the Labrador, and a piece of Benjamin Franklin's apparatus, belonging to the University of Pennsylvania.

DANGEROUS DAMPERS.

The *Times* of Hamilton, Ont., gives the details of a very sad case of suffocation by gas from a coal stove. The stove was a small self-feeder, without any inner lid to the cover, and the pipe was provided with a very common but abominable contrivance called a damper. It appears that when discovered by the neighbors the mother and one child were already dead, and the father very nearly so. The only cover which the stove had was found partly off, the damper was closed, and, as a consequence, all the gases from the burning coal escaped into the room. In this particular case the accident might have happened even without any damper in the pipe, although a portion of the gases might have found an outlet through the proper channel had it not been obstructed. There are cases enough, however, in which the damper has caused serious accidents to warrant its emphatic condemnation. In the first place, the idea of controlling combustion by placing a check in the outlet pipe is entirely wrong. The products of combustion should be allowed to escape into the chimney without any hindrance. If the fire burns too fast it should be controlled by regulating the air supply by means of the draft, and any stove in which this cannot be done is not fit for domestic use.

ELECTRIC LIGHT NOTES.

The trustees of Cornell University, at Ithaca, have authorized the establishment of a course in electrical engineering.

At Hartford, the 28th ult., arrangements were made by which the American Electric Light Company of Boston is to acquire a controlling interest in the Hartford Electric Light Company.

The Chicago Sectional Electric Underground Company have now completed one mile of conduit, the depth below the surface averaging two feet (four feet when street is filled). There are two cables containing each 40 copper wires, insulated.

The Edison Electric Illuminating Company of Boston was organized March 28. Capital $1,000,000. Directors, A. Tower, Theodore Dean, Charles Babbidge, George P. Denny, R. P. Hallowell and W. L. Garrison; clerk and treasurer, W. L. Garrison; general manager, C. D. Stickney.

The Western Union Telegraph Building, at the corner of Broadway and Dey street, this city, is about to be lighted from the Edison Central Station. It is being wired for 345 lamps, though at present but 255 are to be used. These are distributed as follows: Associated press room, 55; operating room, 107; ground floor, 55; halls, 8; first and second floor, of No. 8 Dey street, 15 each.

A temporary injunction was granted March 28 against the Maxim Electric Light and Power Company of Philadelphia, restraining them from erecting poles on Delaware avenue. The application for injunction was made by counsel for the city of Philadelphia, as trustee under the will of Stephen Girard, on the ground that the city has no power to grant a franchise for this part of Delaware avenue, except as trustee.

A committee, under auspices of the Society of Telegraph Engineers and Electricians, will arrange the British Section at the Electrical Exhibition, at Vienna, which opens in August. The Crown Prince Rudolph is patron of the enterprise. English correspondents state that one of the principal features will be the exhibits of M. Marcel Deprez for the transmission of power by electricity.

A circular issued by the Treasury Department in regard to the electrical exhibition to be held by the Franklin Institute, at Philadelphia, states that "articles arriving at the ports of Boston, New York or Baltimore, destined for the exhibition of 1883 or 1884, may be shipped by bonded common carriers from the port of first arrival to Philadelphia. On arrival at Philadelphia they will be taken possession of by the collector of customs, and an entry for warehouse in the usual manner will be required, after the bonding of the exhibition building, whereupon an appraisement will be made and the rate and amount of the duties determined. Storage of the merchandise will be permitted in a portion of the building, duly bonded. Goods withdrawn for consumption on payment of duties, after one year from the date of their importation, will be subject to an additional duty of 10 per centum of the duties otherwise accuring.

Mayor Edson has vetoed the resolution passed by the Aldermen of this city, as noticed in our issue of March 22, permitting the New York Electric Lines Company to lay wires in or through the streets. He says, "the right to use the public streets for purposes which involve the tearing up of pavements, excavations in the streets, and the subsequent obstruction of crowded thoroughfares, should be granted only when great public benefits are to be realized. It appears from such investigation as I have been able to make, that this company at present exists only on paper, and its further development depends upon its obtaining the right to lay wires under the streets of New York and Brooklyn, which it proposes to lease for electrical purposes, and that from these sources alone the revenue of the company is to be derived."

DRAIN TESTING IN GLASGOW.

The following interesting report on the testing of house drains is one of the strongest arguments in favor of official supervision of plumbing that we have seen. In our Novelty column we describe a machine for making the smoke test; whether it is the one used in Glasgow or not we do not know, but that is probably something of this character.

Mr. Kenneth Macleod, the sanitary inspector, on drain testing for the year ending February 20, 1883, reports to the Health Committee as follows:—"I beg to report that, during the year ending on 20th February last, the drainage systems of 236 properties were tested by the smoke injector, with the following results—viz., 229 of these were found more or less defective, permitting the escape of sewer air into the dwellings, and only 7 were found thoroughly tight and efficient. This being the first report, it will be necessary for your information to go further into detail than may be required in those that will be submitted hereafter. The defects consisted of 46 drains untrapped, 95 unventilated, 6 with open ends, 79 open at their junction with soil-pipes, 50 open at their junction with water-closets, 12 had their piping partly broken, 146 had defective joinings along their course, and 6 were choked. Of the soil-pipes, 14 were found unventilated, 30 perforated by corrosion, 2 holed by rats, and 65 badly jointed. One water-closet, 1 jawbox, and 6 internal surface gratings were untrapped, 18 traps were found ineffective by malformation, 3 traps unlocked by suction, and 2 standing waste-pipes of water cisterns joined to soil-pipe had no protecting seal. From the foregoing it may be safely concluded that the defects are chiefly due to imperfect workmanship in the original construction of the drains and their connections, teaching in the very clearest possible way the urgent necessity that exists, not only for special supervision over every newly-constructed system, but the prohibition of its use till thoroughly tested and certified safe and complete by a competent officer specially appointed for that purpose. The gross number of properties operated upon may be classified as follows:—1st, 66 self-contained dwellings; 2d, 69 tenements of flatted houses, rented at £30 and upwards; and 3d, 101 under that rent, including six, five, four, three, two, and one apartment dwellings. The drains of the first and second class were, with one exception in the first class, found defective. The other six efficient drains were found amongst the third class, and, as they form such an extremely small percentage of the whole number tested, deserve to be recorded. They are as follows, viz:—66 Trongate, 16 Moir Street, 6 Albany Place, 35 Ronald street, 10 Steven street, 40 Grove street, 15 Abbotsford Place. Generally two tests were applied in each case—the first to find out the points of leakage, and the second to prove the efficiency of the required repairs—but in 38 cases it was found necessary to make three applications of the test, in 13 cases four, and in two cases five, before certificates of efficiency could be granted. Our attention was drawn to these properties by cases of infectious diseases found in them by our officers; from complaints by the tenants of offensive smells arising in their dwellings; and by special request of the owners themselves. The tests are carried out by a smoke test operator on our part, aided by a plumber and mason employed by the owner of each property on their part. The improvements effected have given the greatest satisfaction, and generally owners, when asked for permission to apply the test, are most willing to co-operate to a satisfactory conclusion. The great necessity thus shown for rigorous action in this most valuable and life-saving service, and the desirability of making it widely known to the citizens, leads me to suggest that the most extensive publicity should be given to the fact of its being placed freely at their disposal."

NOTES FROM CHICAGO.

(From our Special Correspondent.)

CHICAGO, ILL., *March* 29, 1883.

Whichever way the local political cat, now crouched low, shall jump, Chicago streets are sure to be the cleaner. The war cry of the Opposition, comprising Republicans, Independents, and many Democrats, has been "Clean streets!" all through the fierce two weeks' campaign, and the renomination for Mayor, yesterday, of the present incumbent, was signalized this morning by a double-sized broom brigade hacking away at the heaped piles of snow and mud. Until election morning, at least, no hands with strength enough to raise a hoe need be idle, and in the contention of parties, sanitary interests will have achieved a substantial victory before these words are read. The victory promises, too, to be more than short-lived, as "through the influence of the administration," (as is heatedly claimed) the appropriation just passed for street cleaning—$180,000—is considerably greater than for any preceding year.

Next to politics the city is given over to experiments—and preparations to experiment—in underground electric systems, and the way in which alleys are being torn up and side walks tunneled is unprecedented.

"I hear of one hundred separate and distinct movements" said an electrician, interviewed for THE SANITARY ENGINEER, yesterday, "to put down sidewalk conduits, and so gobble up the immense prospective business that is expected to come by May Day, when, as these shrewd contractors know, the hundreds of wires of the Western

Digitized by Google

Union Telegraph Company are going to be snipped, like the Mutual Union wires, a month ago, unless our Lord Mayor consents to a compromise and delay."

"There is this difference, however," your correspondent remarked, "that the Mutual Union formally, by charter, agreed on March 1, as the date when all their wires should be underground, whereas, in the case of the Western Union, the date (May 1) has simply been fixed by Council ordinance, the company never having agreed to it."

That is true; and the result, now that Mayor Harrison has shown his hand, will no doubt be a writ of injunction, a safe way in advance of May Day, and no end of litigation, with a good prospect that the wires will continue to veil the face of Chicago and mother earth with their steel lace work for an indefinite time to come.

All the same, the projectors of the underground schemes are busy as ferrets; three new charters were asked of the Council committee at its last session, one being favorably reported, and the advertisements of official tests to be made fill daily space in the papers. The nearest at hand of these examinations will be next Tuesday, the line to be inspected being a mile on Wentworth avenue, from the city limits north. The devices and methods of construction are of all kinds, and, if for no other reason, too technical for enlargement here. The fact that Professor Elisha Gray, an electrician known everywhere, predicts a unique success for one system, awakens considerable interest in the coming test.

In the meantime—and the concession shows a conciliatory disposition in the Council—temporary authority was granted at the session Monday night to string an "aerial cable" like those operated in New York for a year (as also in this city for some months across a single street to the Chamber of Commerce), and already the Western Union has half a mile well under construction.

Three nights ago the annual appropriation bill passed the Council, and contains provisions more ample than usual for sanitary purposes and public works in Chicago. The Health Department secures $108,405, with several extra sanitary police. Besides the sum already named for street cleaning, there is $170,523 for street improvement; and other prominent amounts are $60,000 for viaduct construction; $55,000 for canal pumping works; $42,000 for bridge construction and repairs; $23,000 for the harbor; $20,000 for Fullerton avenue conduit; $12,000 for Washington street and LaSalle street tunnels—altogether $537,549 for the Department of Public Works. The whole bill appropriates a little over four and a half million of dollars.

Regarding the new west side pumping works, provided for in last year's appropriations, Commissioner of Public Works Cregier, who has just returned from New York, says that the necessary casting will be finished and shipped here in a month or two, and the pumps will be supplying the hydrants of citizens by September 1.

The Illinois Central Railroad Co. have offered a site for the new morgue at the foot of Randolph street, and the plan is favored, the revised estimate of cost being $15,000.

Repairs will at once commence on the Union Club's elegant house at Dearborn avenue and Worthington Park, damaged $80,000 by fire Monday night, on the eve of occupation, the restoration requiring till September 1. Significantly, the night watch has been doubled at the Calumet Club's still more handsome new home, at Michigan avenue and Twenty-first street, also on the point of occupation.

All over the city there is marked activity in building preparation, the monthly permits exceeding considerably those of any preceding March, and in consequence the architects, the contractors, the plumbers, are wearing smiles, meet to welcome the advent of "sweet spring."

Cincinnati has never had a morgue. The stable loft of the City Undertaker's establishment has thus far been the only temporary depository of those who have suddenly died. During the heated term of two years ago, when so many died from sun stroke, the sight presented in this excuse for a morgue was disgraceful to a city of this size. Now, however, there is some prospect of having one with the ordinary facilities. A bill is pending to appropriate $20,000 for the construction of a building in the jail yard. There is some disagreement in regard to the location, but the city is likely to have a morgue at last, at some convenient point.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

MACHINE FOR APPLYING THE SMOKE TEST.

English exchanges frequently allude to the "smoke test" for drains. The following sketch is reproduced from a circular that came under our notice, which we thought might be a novelty to many of our readers.

No adequate description of the method of operation accompanied the sketch. An examination of it would indicate that the practice is to place some burning material in pail *B*; the turning of the wheel revolves a fan in shell *A*. This drives the smoke through the hose *C* into the drain at some point near its lower extremity, and it will find an exit

at any leaking joint. We presume the open end of the soil pipes are temporarily closed. It would seem that an apparatus of this character might prove very useful in testing soil pipes. If we have not properly explained the machine and the method of using it, we trust some of our English readers will correct us.

The machine, which is called an asphyxiator, is made by John Watts & Co., Bristol, England.

Construction Notes.

WILMINGTON, DEL.—The State Senate have passed a bill authorizing Wilmington to borrow $180,000, to be applied as follows: Not more than $60,000 for the purchase of water rights in the south long race; not more than $50,000 for the establishment of a pumping station on the brandy wine above the manufactories thereon, or if that be not practicable, for the erection of new steam pump at the City Mill; not more than $16,000 for building sewers to carry off the water of Crooked and Rattlesnake runs; not more than $16,000 for enlarging the Rodney street reservoir; not more than $16,000 for laying new mains on Jackson street from Second to Eleventh street, and on Eleventh street from Jefferson to Market street; not more than $11,000 for laying a submerged main under the Christiana River at Market street; not more than $11,000 for building a suplementary reservoir near the Cool Spring Reservoir and for improving the ground thereof.

WASHINGTON, D. C.—Major Thomas P. Morgan, has been awarded the contract for dredging along the proposed sea-wall of the Potomac flats. His bid was 7 cents per cubic yard at the foundation for the slope of the wall and 14 cents per cubic yard between the wall and the five-foot curb.

HYDE PARK, ILL.—Bids for laying the water-main from the water-works to South Chicago have been opened. The work was awarded to Messrs. Dolese & Shepard at 85 cts. per lineal foot. Following is a list of the bids received: M. Clarkson, $1.34 per foot; Robinson & Miner, $1.21 per foot; Ritchie & McNicholl, $1.06 per foot; C. S. Baker, $1.05 per foot, McIntosh, McDonald & Conboy, $1 per foot; McNicholl & King, 92 cents per foot, and Dolese & Shepard, 85 cents per foot.

EVANSTON, ILL.—It is believed that the next Board of Trustees will favor the construction of a sewer for draining low land west of the village, estimated cost $50,000. The scheme provokes strong opposition, and a protest is made in a local paper against voting for any candidate who favors it.

SHARON, MASS.—A bill has been reported in the State Legislature incorporating the Sharon Water Company. Capital $75,000.

LYNN, MASS.—The Water Board decided, March 20, to buy a new steam pump. Cost $6,800.

WORCESTER, MASS.—The Boston *Herald's* legislative report states that the Judiciary Committee reported on the 20th ult. that it was inexpedient to legislate on the petition of the Mayor of Worcester for legislation authorizing the city to enter into contracts with the owners of water rights affected by the taking of Tatnuck brook to supply them with water in lieu of damages.

ROANOKE, VA.—The City Council adopted the system of sewerage which was proposed by Mr. Rudolph Hering, C.E., at their meeting March 1. The cost of the work is set at $29,962.

PHILADELPHIA.—The filthy condition of the streets has so disgusted some of the private citizens and firms of the city that they are having the streets in the neighborhood of their homes and places of business cleaned at their own expense, A. J. Drexel, the banker, and Geo. W. Childs, of the *Ledger*, began the good work by having Chestnut street cleaned from the Delaware to the Schuylkill rivers.

CHICAGO.—March 26 the Commissioner of Public Works opened the following proposals to construct the sub-structure of the Ashland avenue bridge: Sooy Smith & Son, $9,824; Harvey Fox & Co., $9,900; Chicago Dredging and Dock Co., $11,600.

The canal lock at the Bridgeport Pumping Works is now above water line, making navigation possible, although the contractor demures against opening the lock for a month yet (till May 1), unless the canal commissioners will guarantee him against any damage to the fresh masonry.

Superintendent Cheney has prepared estimates of the cost of a sewer on Kedzie avenue in a section of the city which has suffered much from inundation. The *Tribune*, state a 4½ ft. sewer is contemplated, cost $60,000. Also an extension of the sewer in 22d street will be requested of Council, cost $63,000.

NEW YORK.—The following lowest bids were opened at the Department of Docks on the 28th ult.: For building a crib bulkhead and platform at the foot of 75th street, East River, Richard Cronin, $1,700. For repairing the understructure of new pier No. 42, North River, Wm. P. Kelly, $1,819. For repairing pier 52, E. R., Richard Cronin, $2 875. For repairing the small pier between piers 51 and 52, at Gouverneur Slip, E. R., John Gillies, $887.

LOCAL WATER SUPPLIES.—Bills incorporating water companies have been reported in the Massachusetts legislature for the following towns: Attleboro Water Company, capital not to exceed $100,000; East Weymouth Water Company, capital not to exceed $100,000. Bills have also been reported for supplying Wellesley with water, issue of bonds not to exceed $50,000 for water supply of North Adams, and to authorize Natick to supply Wellesley with water. A petition was received for incorporation of a company to supply Franklin with water. A bill has also been reported to permit Nahant to supply drinking water from any water sources belonging to the town.

A bill was introduced in the New York Assembly last week providing for a survey of State lands in Clinton, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Saratoga, St. Lawrence, and Warren Counties, and for the preservation of forests, and for the storage of the waters of the upper Hudson and adjacent streams. $15,000 is to be appropriated for purposes of the survey.

PLUMBING LAW VIOLATION.

But six violations of the plumbing regulations were reported to the Health Department of this city last week—three each by Inspectors Hooper and Dickinson. Most were of a trivial nature.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

266,963. OPERATING TANK-VALVES. JAMES E. BOYLE, Brooklyn, assignor to Henry Huber, New York, N. Y. Filed May, 12, 1882. (No model.) Issued November 7, 1882.

Claim.—1. The combination with a self-closing valve, of a lever and suitable intervening mechanism, substantially as described, whereby at each vibration of said lever said valve will be opened, in the manner substantially as set forth.

2. The combination, as a means for operating a self-closing tank-valve to produce a double discharge from the tank, of the weighted tank-lever, a pivoted dog or small lever in connection therewith, a spur arranged under said dog at a point intermediate of its free and pivoted ends, whereby upon the tilting of the tank-lever the free end of said dog shall be elevated, and an overhanging portion, in connection with the valve, arranged over and to be lifted by the free end of the said dog, substantially as set forth.

3. The combination of lever D, pivoted dog E, spur G, valve-stem C, and overhanging portion connected to said stem, and arranged over and to be lifted by the free end of said dog, substantially as set forth.

4. The combination of lever D, dogs E E, pivoted thereto, bearing-frame F for said lever, and fixed spurs G G, substantially as set forth.

5. The combination of lever D, dogs E E, bearing-frame F, spurs G G, valve-stem C, and disk K, adjustible on said stem, substantially as set forth.

6. The combination of valve-stem C, weight J, and disk K, with lever D, dogs E E, bearing-frame F, having hole *l*, and spurs G G, substantially as set forth.

7. The combination of lever D, having trunnions *i i*, and dogs E E, with frame F, formed in two parts, each consisting of a section of base-plate, *j*, a wall, *k*, pierced with a hole to receive one of said trunnions, and a post, *m*, on which is formed a spur G, substantially as set forth.

8. The combination of lever D, dogs E E, pivoted thereto at equal distances from the fulcrum of the lever, and two fixed spurs, G G, arranged one under each dog, and the two unequally distant from said fulcrum, substantially as set forth.

267,156. OVERFLOW VALVE FOR WASH-BASINS. WILLIAM S. COOPER, Philadelphia, Pa. Filed Sept. 17, 1881. (No model.) Issued November 7, 1882.

Claim.—The combination of the overflow-chest, the valve I, and valve-spindle J, with rack K, the cap H, the pinion P, the spindle M, and handle N, adapted to hold the valve-rod in either of its extreme positions, as set forth.

267,806. WATER-TRAP CLEANER. JOHN S. GALL, Rochester, N. Y., assignor of one-half to John W. Orphy, same place. Filed April 17, 1882. (No model.) Issued November 7, 1882.

Claim.—1. The combination, with an S-trap, of a shaft, forming a fork or paddle, passing through a rolling or self-adjusting bearing at top bend of the trap, said shaft having end movement in the bearing and being capable of being inserted in the lower bend of the trap, of being elevated therefrom, and of being thrown over into the discharge end of the trap, as set forth.

2. The combination, with an S-trap, of the ball *B* and socket C in the top bend of the trap, and the fork or paddle D, provided with a a shaft, *a*, which passes through a hole in the ball, the ball being capable of rotary movement in its socket and the shaft capable of end movement in the ball, as herein shown and described.

267,826. DRAIN TILE OR PIPE. NEWTON B. CHILDS, Kansas City, Mo. Filed Sept. 8, 1882. (No model.) Issued November 14, 1882.

Claim.—In the manufacture of cement or asphaltum pipe, the sheet of metal having a portion along its edge provided with slots or perforations, whereby such perforated portion, as compared with the rest, is gradually rendered non-elastic, for the purpose specified.

268,006. STOP-COCK. JOHN L. DIBBLE, Brooklyn, N. Y. Filed Feb. 16, 1882. (No model.) Issued Nov. 28, 1882.

Claim.—1. In a stop-cock, the elastic plug-shell D, formed of a single piece of metal, in combination with a turning shaft, B, and connections thereto, which allow the shell to be expanded by the pressure of the fluid, and with the casing A, having the water-way A^2 A^3, as herein specified.

2. In a stop-cock, the elastic plug-shell D, in combination with a *soft exterior facing*, E, and with the shaft B, arms B^3 B^4, and inclosing-case, A, as herein specified.

3. In a stop-cock, the compound elastic shell D, composed of two thicknesses of sheet metal, D^1 D^2, arranged as shown, so that the joint of one shall come opposite a continuous portion of the other, as herein specified.

4. The casing A, shaft B, elastic shell D, arms B^3 B^4, thereto, conical surface B^1, and spring C, arranged to serve relatively to each other and to the casing A of a stop-cock, as herein specified.

5 The elastic shell D, compounded of two layers of tapering thickness, arranged as shown, and provided with the engaging projection d^1 and the aperture d^2, in combination with the operating-shaft B, with its arms B^3 B^4, conical surface B^1, spring C, and inclosing-case A, arranged for joint operation, as herein specified.

267,733. SELF CLOSING FAUCET. CHAS. WHITTAKER, Chicago, Ill. Filed May 12, 1882. (No model.) Issued Nov. 21, 1882.

Claim.—1. In a self-closing faucet, a chamber located above the spout, provided at its lower end with a partition adapted to exclude the water from said chamber, in combination with a screw sleeve, a valve rod, and a spiral spring, located in said chamber above said partition, said sleeve being provided with a rod extending through said partition to the lower side or entrance to said water chamber, substantially as set forth.

2. In a self-closing faucet, a chamber for the reception of the spring valve rod and sleeve, provided at its lower end with a partition located below said spring and sleeve for excluding the water, whereby the packing at the upper end of the valve rod is dispensed with and the spring and sleeve are protected from the water, as set forth.

3. The chamber I, having cap E, formed in the same piece therewith, provided with groove K, in combination with rod A, provided at its lower end with screw B, spring D, sleeve C and rod F, valve M, packing or partitions H, and chamber G, substantially as set forth.

4. The device for retaining the valve rod in place and counteracting the force of the spring when raising the valve, by which the retaining nut is prevented from turning, consisting of annulus *b*, having a square central opening fitted to and adapted to turn with the valve rod, conforming in shape thereto, nut *a*, secured to said rod and adapted to rest on said annulus, said annulus being adapted to turn with said rod and nut, whereby the nut is relieved from liability of being unscrewed, as set forth.

5. In a self-closing faucet, the combination of the valve rod A, provided with screw B, sleeve C, adapted to move upward and downward in said screw, and spring D, said screw being adapted, when turned, to raise said sleeve and compress said spring, whereby the valve is opened, said spring being adapted to press down said sleeve and reverse said screw automatically, whereby said valve is closed, as set forth.

6. In a faucet having a chamber located above the spout and a partition interposed between said chamber and said spout, a sleeve located above said partition, and a rod projecting below said partition, in combination with a detachable valve, whereby said rod may by removing said valve be inserted through said partition, as set forth.

7. The screw sleeve C, provided with circular flange P, for supporting the spring, collar R of less diameter than said flange, in combination with spring D and valve rod A, said collar being adapted to retain said spring at the periphery of said flange and prevent contact of said spring and screw rod, as set forth.

8. The combination of cap E, provided with recess S, with spring D, rod A, and sleeve C, as set forth.

268,028. WATER-CLOSET. FRANCIS W. KELLY, Minneapolis, Minn. Filed July 20, 1882. (No model.) Issued Nov. 28, 1882.

Claim.—1. In a water-closet, the combination of a deposit-bowl and a water-tank, both adapted to hold water and communicating with each other below the water-line of both, and a valve which, when opened, permits the contents of the bowl to be discharged and the water to pass from the tank through the bowl in quantity sufficient to flush the bowl, substantially as and for the purpose set forth.

2. In a water-closet, the combination of a deposit-bowl and water-tank communicating between their upper and lower ends and having a tubular connection at their lower ends, in combination with a valve serving to cut off the tank from the tube communicating with the bowl, and also as a valve for controlling the discharge of the deposits from the bowl and the influx of water from the tank to the bowl, substantially as and for the purpose set forth.

3. The combination of tank B^1, provided with an overflow, B^3, and having a contracted neck, bowl A, connecting with the tank by a flushing-tube, h^1 h^2, tube C, and a valve e^1, controlling the opening and closing of tube C, and fitting in the neck of the tank, so as to cut off the tank from tube C and cause the water to flow from the tank into the bowl through the flushing-tube, substantially as and for the purposes set forth.

4. The combination of the bowl A, tank B^1, connecting-tube N^1 N^3, and ventilating-tube N^4, substantally as set forth.

5. The combination of bowl A, tank B^1, tubes G^2 G^3, ports s^1 s^2, a valve for controlling the flow of water from one of said tubes to the other, and a float connected to and adapted to be moved to open and close said valve, substantially as set forth.

6. The tube D, having the valve-seat *b*, in combination with the valve consisting of the disk c^1, rubber cushion c^1, adapted to fold over the edge of said disk, and stem d^1, substantially as set forth.

268,062. APPARATUS FOR TURNING OFF WATER IN BUILDINGS. JOSEPH D. WESTGATE, Manchester, N. H., assignor of one-half to Geo H. Allen, Lynn, Mass. Filed June 12, 1882. (No model.) Issued Nov. 28, 1882.

Claim.—1. The combination with the water-supply pipe in a building, of a stop-cock located near the point where the said pipe enters the building, and means to actuate the said stop-cock from various different points in the building, substantially as described.

2. The stop-cock provided with an actuating pulley, combined with a flexible cord or belt connected with an actuating pulley having a handle, and located at a distance therefrom, substantially as described.

268,024. WOODEN PIPE. LUMAN F. JOHNSON and IRA E WILLIAMS, Palmyra, N. Y. Filed Aug. 14, 1882. (No model.) Issued Nov. 28, 1882.

268,031. INCREASING AND REDUCING JOINT FOR ELECTRIC-WIRE CONDUITS. CHARLES LINFORD, Pittsburg, Pa. Filed Feb, 15, 1882. (No model.) Issued Nov. 28, 1882.

268,035. FURNACE. JOHN G. MCAULEY, New York, N. Y. Filed Oct 22, 1881. (No model.) Issued Nov. 28, 1882.

268,059. SUBMARINE ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Apr. 10, 1882. (No model.) Issued Nov. 28, 1882.

268,060. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Sept. 27, 1881. (No model.) Issued Nov. 28, 1882.

268,077. DEVICE FOR BURNING PETROLEUM. RICHARD A. BURY and ROBERT M. BIDELMAN, Adrian, Mich. Filed Sept. 16, 1882. (No model.) Issued Nov. 28, 1882.

268,081. STEAM-TRAP. GEORGE W. COFFEE, San Francisco, Cal. Filed Aug. 12, 1881. (No model.) Issued Nov. 28, 1882.

268,082. SAFETY-VALVE. GEORGE E. COLLIER, Bay City, Mich. Filed June 10, 1882. (No model.) Issued Nov. 28, 1882.

268,083. GAS STOVE AND BURNER AND HEATING-DRUM. EMANUEL DETWILER, Milwaukee, Wis. Filed Sept. 28, 1882. (No model.) Issued Nov. 28, 1882.

268,096. GAS-RETORT FURNACE. HENRY C. HANN, Baltimore, Md. Filed Sept. 8, 1882. (No model.) Issued Nov. 28, 1882.

268,098. STEAM-BOILER FURNACE. WILLARD T. HATCH, Indianapolis, Ind., assignor to the Atlas Engine Works, same place. Filed Oct. 5, 1881. (No model.) Issued Nov. 28, 1882.

Food and Drugs.

COFFEE AND MUSTARD MIXTURES.

STATE BOARD OF HEALTH OF NEW YORK,
ALBANY, *March* 28, 1883.

To the Editor of THE SANITARY ENGINEER:

As the Governor has approved the action of this Board, as expressed in its resolution here annexed, I forward to you a copy for publication, as requested. Certainly, no coffee merchant will feel harmed, excepting he be of the class which this action compels to supply wholesome coffee instead of some spurious mixture.

The requirements of at least 40 per cent. of farina of mustard as the minimum of the article must "rule out" the chaff and dust that might pass in market as the mustard of trade but for this specification.

Respectfully yours, ELISHA HARRIS.
Secretary.

"*Resolved,* That under and pursuant to Section 4 of Chapter 407 of the laws of 1881, the following mixtures when distinctly labelled in the manner provided in subdivision 7 of Section 3 of said Act, are within the conditions hereinafter prescribed declared to be exempt and permitted to be sold under the provisions of the said Act.

"1st. Coffee mixtures containing no other substances except chicory, peas or cereals, and in which mixtures the pure coffee shall not be less than 50 per cent. of the whole mixture or compound, provided that the exact percentage of coffee be printed upon the label of each package.

"2d. Mustard mixtures with wheat or rice flour, to which no other substance, or article, or any coloring matter, except tumeric is added, and in which mixture the pure farina of mustard shall not be less than 40 per cent. of the whole mixture or compound, exclusive of the mustard hulls.

"The labels on the above mixtures shall contain the names of each and every ingredient of the mixture.

"The labels shall also exhibit the percentage of the characteristic constituents; for example, the percentage of coffee in the coffee mixture and the percentage of mustard in the mustard mixture.

"The above mentioned information shall be printed on the labels in black ink, in legible antique type, of a size easily to be read, on one side of the package."

Approved March 24, 1883.
(Signed.) GROVER CLEVELAND.

True Copy from the Minutes of the Board, meeting Feb. 24, 1883.
(Signed) ELISHA HARRIS, Sec'y.

BOARD OF HEALTH REPORTS.

FIRST REPORT OF THE BOARD OF HEALTH OF THE CITY OF MACON, GA. By J. EMMETT BLACKSHEAR, M.D., Chairman, for the year 1882. 15 pp., 8vo.

The greater part of this report consists of a sort of lecture to the Mayor and Council on the importance of sanitation. It is a very good lecture, but it does not convey that amount and kind of information which we like to find in such a document.

From the tables at the end we learn that there were 240 deaths in the city during the year, 77 of which were under five years of age. There were 35 deaths from consumption, 17 deaths from malarial fevers, and five from typhoid. In connection with these figures should have been given some information as to the sewerage and drainage of the city. We are told that "the sewer recently constructed from Cherry street to the river does credit to the city," and that it cost $15,000. Now we should like to know how this sewer was constructed; its size, number of connections, etc. If it is a model sewer, it should be described so that other cities can do likewise.

The Board has a sanitary inspector, but he does not seem to have found anything in particular; in fact, the only thing we learn about him is that his salary is $600.

We have no doubt that the Board of Health of Macon is a useful institution and doing good work, but its attention should be called to the fact that a hygienic tract filled with quotations is not a report, and that if it wishes to gain the respect and confidence of the citizens of Macon, and of sanitarians elsewhere, it must get out of the sphere of glittering generalities and furnish some information. Every one of those typhoid fever deaths was a problem to be investigated by the Board. How was it caused? What were the causes of death among the children? What sort of milk supply has the city? And we could easily put a hundred such questions, a complete answer to any one of which would be worth a ton of essays on the importance of sanitation in general.

We hope that the next report will tell us something about Macon—its drainage, sewerage, water supply, markets, prevailing diseases, etc.—for at present we do not know where to advise a traveller to look for this information.

THIRD ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF SOUTH CAROLINA, for the fiscal year ending October 31, 1882. 211 pp., 8vo.

The State Board of Health of South Carolina is the Medical Society of that State, which exercises its functions in this respect through an Executive Committee of seven members, appointed by the Governor on the recommendation of the Association, together with the Attorney General and Comptroller General of the State, who are members *ex officio*.

The Secretary of this committee, Dr. H. D. Fraser, of Charleston, reports that there have been no extensive epidemics during the year, and that as regards local epidemics, only 17 of the 46 local Boards of Health have sent replies to a circular issued calling on them for information.

The Chairman of the Committee on Endemic and Epidemic diseases, Dr. J. Ford Prioleau, of Charleston, calls attention to a disease prevailing in the State, which appears to be a form of contagious ophthalmia resulting in granular lids, very much like that which was so prevalent in Belgium some years ago. He remarks that malaria is increasing in the State, and that the colored population are losing the immunity which they formerly enjoyed against this disease. Consumption is also becoming more prevalent and fatal in the colored race.

The Committee on Quarantine, Dr. T. Grange Simons, Chairman, reports strongly in favor of keeping up the Sapelo Sound Refuge Station, to which can be sent such vessels as it is not considered safe to admit to the harbors of the State. The appendix contains brief popular essays on the hygiene of schools, by Dr. B. W. Taylor, on the injurious effects of the improper use of the sewing machine upon women, by Dr. W. T. C. Balis; on soil pollution, by Dr. Mayer; on teething children, by Dr. A. S. Hydrick; the organization of local boards of health, by Dr. Simons; on healthy cottages, by Dr. Hanahan; the relation of slaughter houses to the public health, by Dr. John B. Elliott, of New Orleans; on excessive use of tobacco, by Dr. Evans, and on the duties of the State to the inebriate, by C. R. Tabor.

It is possible that essays of this kind are read by some people, and that they do some good. Certainly the majority of sanitarians in this country seem to think it advisable that such essays should be prepared and printed in connection with reports of State boards of health, but we most confess to having great doubts as to their utility.

South Carolina appears to have no system of registration of vital statistics, and the Board makes no recommendation with regard to the establishment of such a system. We do not find any financial statement in the report, and infer that there were no appropriations. On the whole, the State Board of Health of South Carolina seems at present to have no powers and no funds, although in the case of the occurrence of imminent danger, in the form of an epidemic, it would no doubt be found useful. We sincerely hope that its efforts at educating the people and the legislators as to the importance of sanitary work may meet with success.

Notes and Abstracts

FROM REPORTS OF HEALTH OFFICERS, ETC.

An accident prevents our printing the usual Mortality Table in this issue. We will, therefore, furnish two tables next week.

BALTIMORE, MD.—There were 190 deaths in Baltimore during the week ending March 24, males 85, females 105; under five years 74, over 60 yearss 32. Annual rate calculated on the local estimates of the population 24.15; that for the white people being 22.20 and for the colored 35.53. Small-pox occasioned 13 deaths, measles one, scarlet-fever 11, whooping-cough one, croup two, diphtheria 15, diarrhœal diseases one, typhoid fever one, intermittent fever one, erysipelas and puerperal fever none, consumption 24, bronchitis five, pleurisy two, pneumonia 23, congestion of lungs two, and violence two.

DETROIT, MICH.—Dr. O. W. Wight reports 19 new cases of diphtheria and 19 of scarlet fever.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 27 new cases of scarlet fever, making 36 of this disease under treatment, and eight new cases of diphtheria, making a total of 12 on hand.

BOSTON, MASS.—C. E. Davis, Jr., reports 17 new cases of diphtheria, 22 of scarlet fever, and six of typhoid fever.

NEW YORK CITY.—The case of small-pox reported in the table is detailed by Dr. Jno. T. Nagle to have arrived from Bremen by the S. S. "Elbe."

HOLYOKE, MASS.—City Clerk M. J. Guffin reports the occurrence of two cases of small-pox.

PITTSBURGH, PA.—Dr. W. Snively reports three cases of small-pox.

LYNCHBURG, VA.—Dr. Thos. L. Wallen reports two cases of small-pox in hospital, but none in the city.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELLS' ISLAND.—Dr. T. M. Franklin, Superindendent, reports 1,341 insane patients remaining under treatment at the end of the week. There were 11 admissions, six discharges and three deaths during the week.

ROCK ISLAND, ILL.—G. G. Craig, M.D., Reports three deaths during the week, two of which were in persons under five years. Measles caused one of the deaths, congestion of the lungs one, and consumption one.

PROVIDENCE, R. I.—Dr. E. M. Snow in his report for the week remarks: "There seems to be nothing remarkable in the mortality for the week; but every one is conscious of something unusual and uncomfortable in the weather. This abnormal state of the atmosphere has existed in different forms all winter, and has been the cause of a great amount of sickness, though without any excessive mortality. We may hope that with the advent of milder weather the unusual sickness will disappear."

MICHIGAN.—Dr. H. B. Baker's report for the week ending March 17 shows the prevalence of influenza, bronchitis, rheumatism, neuralgia, consumption, pneumonia, intermittent fever and tonsilitis. Diphtheria was reported present at 16 places, scarlet fever at 18 places and measles at 14 places. No small-pox was reported in Michigan.

READING, PA.—The report of the Board of Health of the City of Reading, Pa., for the year 1882 has been received. The population is given as 45,750. The births for the year numbered 1,316 or an increase of 33 over the preceding year. The deaths numbered 890 including 57 still-births and 20 premature births. The annual mortality rate is given at 19.4 per 1,000. There were 386 cases of scarlet fever reported to the board during the year and of this number 93 proved fatal; the greatest mortality from this disease occurred in February. Cholera infantum carried off 58 children, diphtheria caused 15 deaths, typhoid fever 16, malarial fevers 26, pneumonia 36, and violence 34. Four cases of small-pox occurred during the year of which one proved fatal.

ONTARIO, CANADA.—During the week ending March 10 bronchitis influenza, anæmia, neuralgia and tonsilitis were the prevailing diseases. The *Provincial Bulletin*, notices with pleasure the appointment of a health officer by the City of Toronto, and hopes that this appointment is but one of many which will be made by municipalities during the coming year. During the week ending March 17 a considerable increase in the prevalence of influenza was noticed, and a very marked increase in that of measles.

MATANZAS, ISLAND OF CUBA.—Consul David Vickers announces, under date of March 16, the occurrence of a case of yellow fever which is expected to prove fatal. This is an unusually early appearance of the disease and the physicians fear great and fatal increase.

CARDENAS, CUBA.—Commercial Agent J. A. Nunez reports the absence of yellow fever during the week ending March 17.

VALPARAISO, CHILE.—Vice-Consul August Motter Jr. sends the report for the month of January which shows 516 deaths in a population of 120,000, males 269, females 247. Small-pox caused 65 of the deaths, fever 122, consumption 58 and diseases of the respiratory system 72.

CITY OF MEXICO, MEXICO.—During the week ending Feb. 11 there were 218 deaths; under five years 94, over 70 years 14. Small-pox caused one death, typhoid fever 14, whooping cough four, puerperal fever one, consumption 12, pneumonia and bronchitis 53. No deaths occurred from measles, scarlet fever, croup or diphtheria.

PERNAMBUCO, BRAZIL.—Consul H. L. Atherton reports for the weeks ending Jan. 29 and Feb. 5. During the former period seven deaths were caused by small-pox in a total mortality of 76, and during the latter 10 in a mortality of 72, population 109,300.

Digitized by Google

ENGLAND.—Consul-General E. A. Merritt sends the Register-General's return for the week ending March 10. The annual rate of mortality in the 28 large towns of England and Wales average 23.0 per 1,000; it being lowest in Cordeff 15.6, and highest in Preston 33,4. Small-pox caused two deaths in London, one in Wolverhampton, one in Birmingham and one in Newcastle-upon-Tyne.

London.—Births 2,480; deaths 1,648. The former were 381 and the latter 169 below the average numbers in the corresponding weeks of the last ten years. Annual rate 21.7. The deaths included two from small-pox, 29 from measles, 19 from scarlet fever, 12 from diphtheria, 45 from whooping cough, two from typhus, 11 from enteric fever, nine from diarrhœa and 65 from violence.

SCOTLAND.—Consul J. A. Leonard, Edinburgh, transmits the return of the Registrar-General for the week ending March 10. The death rate in the eight principal towns was 26.4 per thousand of the estimated population. The lowest mortality was recorded in Edinburgh 19.2, and the highest in Leith, 32.0. The most fatal zymotic diseases were whooping cough and measles in Glasgow and whooping cough in Dundee.

Edinburgh.—Total mortality 87; rate 19.2; no deaths registered from small-pox, measles or diarrhœa. Scarlet fever caused two deaths, diphtheria six, whooping cough four, fever four, acute lung diseases 18 and violence three.

IRELAND.—Consul A. B. Wood, of Belfast, sends the return of the Registrar-General for the week ending March 3.

Belfast.—Mortality 128; rate 31.1 No deaths are recorded from small-pox, typhus or typhoid fevers or diphtheria. Measles caused one death, scarlet fever 14, whooping cough four, diarrhœal diseases two, consumption 21, acute lung diseases 32 and violence two.

Consul Wood sends also the returns of the Registrar-General of the births and deaths in the Dublin registration district and in 15 of the principal urban sanitary districts in Ireland, for the year 1882.

Dublin Registration District.—Births 10.073; deaths 9,699. The deaths were equal to one in 36 or to 27.8 per 1,000 of the estimated population as against an average rate of 26.4 for the preceding ten years. Of the decedents 4,704 were males and 4,995 females. No deaths from small-pox was registered during the year. Measles caused 567 deaths compared with an average of 187 for the ten years 1872-81. Only 37 deaths from scarlet fever were registered against 120 in the year 1881, and an average of 292 for the preceding ten years. Diphtheria caused 31 deaths, or four under the average. Whooping cough caused 81 deaths, or 82 below the average. The deaths registered as from fever numbered 248, being 68 under the average; of these 84 were caused by typhus. Diarrhœa and dysentery caused 247 deaths, or one over the average. Consumption caused 1,182 deaths as compared with an average of 1,026. Diseases of the respiratory system caused 2,114 deaths, of which 1,444 deaths were caused by bronchitis, 407 by pneumonia, and 61 by croup. Violence caused 237 deaths. Of the 9,699 deaths 3,317, or 34 per cent. were of children under five years of age, and 2,201 or 23 per cent. were of persons aged 60 years and upwards, including those of 1,056 persons aged 70 years and upwards, of whom 47 were stated to be nonagenarians, and one, a woman, was returned as 110 years old.

In the sixteen urban districts (including the Dublin District) with an aggregate population of 843.553, there were, during the year 1882, 25,038 births, or 29.7 per 1,000, and 21,886 deaths, giving a rate of 25.9 per 1,000. Sligo returned the lowest death rate, 19 2, and Kilkenny the highest, 28.1. Small-pox caused 97 deaths, 82 of which occurred in Belfast, measles 815, scarlet fever 312, typhus 268, whooping cough 206, diphtheria 74, enteric fever 224, diarrhœa and dysentery 677, consumption 2,824, diseases of the respiratory system 4,722, and violence 397.

PARIS, FRANCE.—The *Bulletin* for the week ending March 6, records a total of 1,140 deaths; males 652, females 488; under five years, 347; over 60 years, 230. Annual rate 26.45. Typhoid fever caused 29 deaths, small-pox 10, measles nine, scarlet fever five, whooping cough seven, croup and diphtheria 46, erysipelas eight, puerperal infection four, consumption 245, bronchitis 49, pneumonia 95, and violence 23.

On March four there remained under treatment in the hospitals 84 cases of small-pox, 370 of typhoid fever, and 50 of diphtheria.

The number of deaths registered as having occurred from consumption during this week is greater than in any weekly period since Feb. 16, 1882.

RHEIMS, FRANCE.—Consul Jno. L. Frisbie's report for the week ending March 3, shows 57 deaths; under five years, 21; over 60 years, 12. No deaths are recorded from scarlet fever, measles, small-pox, whooping cough, diarrhœal diseases or erysipelas; but puerperal fever caused one death, croup and diphtheria five, typhoid fever one, consumption eight, pneumonia four, bronchitis four, and violence three. Population 93,823.

BORDEAUX, FRANCE.—Consul G. W. Roosevelt sends report for the month of February, showing a total of 488 deaths (including 29 still births), in a population of 221,305. No death was reported from small-pox, measles or scarlet fever. Typhoid fever occasioned 14 deaths, croup and diphtheria nine, whooping cough two, puerperal fever three, erysipelas one, dysentery two, consumption 83, acute bronchitis 16, congestion of lungs nine, pneumonia and pleurisy 34, and violence 12.

GIBRALTER, SPAIN.—Consul H. J. Sprague reports three deaths from small-pox in a total mortality of nine, during the week ending March 4.

BRUSSELS, BELGIUM.—During the week ending March 3 there were 297 births and 205 deaths in the city and suburbs, the former being equal to an annual rate of 36.2, and the latter to a rate of 25.2. Of the deaths, 83 occurred among children under five years. No death was reported as occasioned by scarlet fever, typhoid or typhus fevers, or diphtheria. Small-pox caused five deaths, measles two, croup three, whooping cough three, diarrhœal diseases 17, bronchitis and pneumonia 29, and consumption 31.

STOCKHOLM, SWEDEN.—Consul Elfwing's report for the week ending Feb. 24, states the mortality to have been 92, or at the annual rate of 27.5 per 1,000. Of the total 50 were males and 42 females; 42 under five years of age, and 14 over 60 years. No death is recorded from small-pox, whooping cough, croup and diphtheria, puerperal fever or erysipelas. Measles occasioned 14 deaths, scarlet fever five, typhoid fever one, diarrhœa six, consumption eight, bronchitis four, pneumonia 14, and violence one.

During the week ending March 3, the following cases were reported by the physicians:—Measles 61, scarlet fever 24, whooping cough seven, erysipelas eight, diphtheria eight, croup one, typhoid fever one, diarrhœa 21, tonsilitis 15, pneumonia seven, and bronchitis 103.

COPENHAGEN, DENMARK.—There were 136 deaths during the week ending Feb. 27, equivalent to an annual rate of 24.76 per 1,000. Children under five years were the decedents in 54 cases. No death was registered from small-pox, measles, scarlet fever or erysipelas. Diphtheria caused two deaths, croup one, whooping cough six, typhoid fever two, diarrhœal diseases four, puerperal fever one, consumption 22, pneumonia nine, pleurisy one, acute bronchitis six, and violence five.

During the week the following cases were reported: Scarlet fever 24, diphtheria 12, croup two, whooping cough 95, typhoid fever three, diarrhœa 87, erysipelas 21, puerperal fever one, bronchial catarrh 376, pneumonia 60, and tonsilitis 139. No case of measles was reported.

VIENNA, AUSTRIA.—Consul-General Weaver's report for the week ending March 3, shows 439 deaths, which number is equivalent to an annual rate of 30.4 per 1,000. Small-pox caused three deaths, measles none, scarlet fever six, diphtheria four, whooping cough seven typhoid fever two, consumption 109, and acute lung diseases 84. The decedents in 159 instances were under five years of age.

ST. PETERSBURG, RUSSIA.—Consul-General Stanton's report for the week ending Feb. 24, shows a total mortality of 718 in a population of 939,525; males 409, females 309; under five years 305; over 60 years 60. Small-pox occasioned 14 deaths, and fevers 35.

On Feb. 25, there remained under treatment in the city hospitals 1,163 cases of fever, 68 of small-pox and 1,277 of venereal diseases.

RIGA, RUSSIA.—Consular-Agent Niles Bomholdt reports 492 births and 368 deaths during the month of January, as compared with 589 and 411 during the preceding month. There were 45 deaths registered as owing to inflammation of the lungs, 39 to consumption, 36 to convulsions, 18 to croup, 18 to typhoid fever, nine to diphtheria, seven to scarlet fever, five to small-pox, three to whooping cough, two to measles, two to pueperal fever, one to diarrhœa and 183 to unregistered causes.

GERMANY.—During the fourth quarter of the year 1882, there occurred 49,647 deaths (exclusive of the still-born) in 173 cities and towns of the German Empire, varying in population from 12,234 in Baden-Baden to 1,156,382, and aggregating 8,573,094. The births for the same period numbered 76,370. The former is equal to an annual rate of 35.6 and the latter to one of 23.2 per 1,000. Of the deaths 22,901 occurred in children under five years of age, and 8,902 in persons over 60 years. Small-pox caused 19 of the deaths, measles 685, scarlet fever 1,298, diphtheria 2,346, croup 341, whooping cough 675, typhoid fever 859, typhus seven, dysentery 48, puerperal fever 279, consumption 6,855, bronchitis and pneumonia 3,915, other acute diseases of the respiratory system 1,236, diarrhœal diseases, in addition to dysentary, 2,919 and violence 1,274.

An inspector of the Brooklyn Health Department reports the abandoned brewery on Ten Eyck street, near Union avenue, a part of which is used as a "station" by the Salvation Army, in an unsafe sanitary condition, specifying that the sewer pipes are open and exposed, the cellar wet from roof water (the leaders discharging into the same), and that the unoccupied portions of the building are in an unclean and offensive condition from refuse.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,
106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our origina packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London, E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Hotels.

THE HYGEIA HOTEL,

ENLARGED AND IMPROVED.

HYDRO-PNEUMATIC PUMP CO.,
E. F. AMES, General Agent.
302 East 23d Street, New York.

WE invite the attention of architects, engineers, builders and all persons interested in House Sanitation, to the following features of the

Durham System OF House Drainage.

Our upright, wrought iron soil and waste pipes are screwed into elbow fittings, connected with the cast iron drains by lead joints. The whole pipe system stands erect, without lateral support, *entirely independent of walls or floors;* it is perfectly stiff, yet elastic, and cannot be broken.

Water Closets are *supported directly from the soil pipe independently of the floor;* they rest upon a cast iron base, to which the water closet is firmly clamped by set screws. *Any good water closet may be used in connection with our system.* We prefer, however, closets having trap above the floor (plunger closets, short hoppers and wash-out closets). Settlement of the floor affects the tightness of the joint between the water closet and the soil pipe, and is a frequent cause of the entrance of foul air into rooms. Our joint cannot be disturbed, being independent of the floor.

Hand holes to remove obstructions without cutting the pipes are provided at every angle or junction, and when closed are steamtight, being packed with steam packing or closed with screw plugs. Our running trap is made accessible on both sides of the water seal.

For further details call and see full size model at the office of the

BARRETT'S LATEST IMPROVED TRAPS.

For Sanitary and Back Water Purposes.

Barrett Patent Cleaning-Out Fitting for Soil Pipes, Drains, &c.

The superiority of Barrett's Improved Sanitary Traps over others now in use is: 1. Simplicity of construction. 2. It does not fill up and remain a filth cesspool. 3. It has a double seal. 4. Syphonage or evaporation has no effect on them. 5. It can be examined easily through two 4 inch trap screws set in the trap. 6. All the working parts and screws are of brass. 7. There is nothing about them to get out of order. 8. It is the best constructed trap of the day. 9. It has a perfect seal without depending on water. 10. It is a sure preventive against sewer gas and back water. 11. It never fails to work. 12. It has all the improvements called for by the ordinances lately adopted by the various cities. 13. It is guaranteed to do all that is claimed for it.

The above articles for saleby
JAMES BARRETT,
Depot, 207 Tremont St.,
Boston, Mass.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

BENNOR'S
Syphon Trap.

The only Brass Trap in the market.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

Agents wanted. *BENNOR SYPHON TRAP CO., (Limited),* 17 *North 9th St., Philadelphia, Pa.*

BEDELL'S

IMPROVED
IRON SEWER GAS
AND
BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE KITCHEN BOILER

AND WATER PIPES.

A few words on their Arrangement and Management; more especially their treatment during Frost, and how to avoid Explosions. By H. Grimshaw, F. C. S., late Demonstrator in the Laboratory of the Owens College, Manchester. Price, 40 cts.

For sale by Book Department, The Sanitary Engineer, 140 William Street, New York. P. O. Box 3037.

THE BOWER
SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

Jenkins' Pat. Valves.

GATE, GLOBE, ANGLE, CHECK AND SAFETY.

Manufactnred of Best Steam Metal.

We claim the following advantages over all other Valves and Gauge Cocks now in use:

1.—A perfectly tight Valve under any and all pressures of steam, oils or gases.

2.—Sand or Grit of any kind will not injure the seat.

3.—You do not have to take them off to repair them.

4.—They can be repaired by any mechanic in a few minutes.

5.—The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat, it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve.

The Jenkins' Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. All Valves sold by us are warranted and are stamped.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

THE TUCKER GREASE TRAP.

THE necessity for the use of a grease trap under kitchen and butler's pantry sinks, is too well recognized by sanitary engineers and plumbers to require any argument. The frequent stoppage of drain pipes which receive the waste water from kitchens of hotels, restaurants and private houses where much dish washing is done, is well known to those who have suffered the annoyance, and been obliged to pay for the frequent removal of the clogging grease. Believing that the *Tucker Grease Trap* is the best device yet designed for that purpose, we have arranged with its inventor to manufacture and supply the trade with this useful appliance.

Mr. Tucker informs us that he has, among others, thus far fitted them up in the following buildings: Residence of Cornelius Vanderbilt, Esq., Residence of the late Robt. L. Stuart, Esq., Residence of Theo. Havemeyer, Esq., and Restaurant in the Mills Building.

The grease is retained in this Grease Trap in the following manner:

The waste water passes down the tube *K*, following the course shown by the arrow into the waste pipe *D*. The depth of the standing water is indicated by the line *L*. Cold water circulates in the jacket *M*. It enters from the cold water pipe *A* and passes out at *B*; this has the effect of chilling the grease in the compartment *N*. The grease being on top, naturally increases in depth until it occupies this space, when it prevents the water passing into the pipe *D*. This will be indicated by its failure to run off. The chamber *N* with the tube *K* can then be lifted out, and the cake of grease removed. The parts may then be put back and again used until it is necessary to repeat the operation.

This represents the form used under and attached to a kitchen or pantry sink.

This represents a form to set on the floor intended for sinks not specially constructed for this trap.

FIGURE 4. Shows the shell of the trap with the grease collector removed.

FIG. 4.

LONDON, 1862

PARIS, 1878

"Imperial" Porcelain Butler's Pantry and KITCHEN SINKS,

Manufactured in England exclusively for, and Imported only by

THE J. L. MOTT IRON WORKS,

88 and 90 BEEKMAN STREET, NEW YORK.

"IMPERIAL" BUTLER'S PANTRY SINKS.

FIVE SIZES.

20 x 14 x 5 inches deep, 23 x 16 x 5 inches deep, 24 x 17 x 5 inches deep, 28 x 17 x 5 inches deep, 30 x 20 x 5 inches deep.

Each size being fitted with 1¼ inch Brass Plug, Coupling and Overflow with Nickel Plated Strainer, Rubber Stopper and Chain.

"IMPERIAL" KITCHEN SINKS.

FOUR SIZES.

30 x 20 x 5 inches deep, 36 x 3 x 7 inches deep, 42 x 24 x 7 inches deep, and 48 x 24 x 7 inches deep.

Each size being fitted with 2 inch Brass Plug and Coupling with Nickel Plated Strainer.

The *"Imperial" Porcelain Sinks* are in all respects the same as our *"Imperial" Porcelain Baths*, and are, without doubt, the most complete line of these fine goods ever manufactured. They are made exclusively for us from drawings furnished by ourselves; sizes, shapes, &c., being made suitable to the wants of the Trade here. We invite inspection of these goods as they should be seen to be appreciated.

The above illustration shows an "Imperial" Porcelain Kitchen Sink set up on Galvanized Iron Legs with Hardwood Rim and Marble Back.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES ON APPLICATION.

All our Sanitary Specialties are fitted up with water attached and may be seen at our Warerooms, 88 and 90 Beekman St

Publisher's Department.

THE SANITARY ENGINEER

HENRY C. MEYER, *is published every Thursday, 140 William Street, New York. Its opinions on sanitary and medical subjects are either prepared or revised by the Editor.*

"A large and flourishing weekly journal, covering the ground of Sanitary Science and recognized as a leading authority on the subject."—*The Nation.*

"It is gratifying to see that the public, as well as the press, are enough interested in Sanitary matters to give such a journal as this, a periodical ably endeavoring to impart much needed information."—*N. Y. Times.*

"THE SANITARY ENGINEER shows an excellent appreciation of what may be done in the field of Sanitary Engineering, and the ability for doing it."—*N. Y. Tribune.*

"The recognized American authority on all departments of Sanitary Engineering."—*Cincinnati Gazette.*

"It has done an excellent work in disseminating the most intelligent opinions on Sanitation."—*Springfield Republican.*

"THE SANITARY ENGINEER has done a noble work in the field it has chosen."—*Boston Herald.*

"THE SANITARY ENGINEER is, beyond question, the ablest publication of its class in this county. The papers prepared for it are from the pens of the ablest experts, and treat of specialties the discussion of which is essential to an intelligent comprehension of sanitary growth and progress."—*Memphis Appeal.*

"The leading journal of the kind published in the United States."—*Troy Times, Dec.* 11, 1882.

"The best journal of its class in this country."—*Bridgeport Standard, Dec.* 30, 1882.

"Standard authority on matters pertaining to its specialty."—*The Machinist.*

"It is a journal with a mission—that of raising the low standard of Sanitary Engineering which exists in the United States. Its large editorial staff includes the names of some of the best known and most practical writers in America on health subjects, and no pains or expense are spared in making the paper useful to the fullest extent."—*Engineering, London.*

"It would be impossible to point out a publication in which the department of public santation receives greater or more careful attention than in the journal of which we have received the fifth and sixth volumes. Whatever fault may be found on this side of the Atlantic with the newspaper press of America, it is an undoubted fact that that portion of the periodical literature of the United States which is devoted to science, occupies a most distinguished place amongst the scientific press of the globe. THE SANITARY ENGINEER stands high in this respect. In its pages the various subjects relating to public health—drainage, water supply, ventilation, heating and lighting—are most conscientiously attended to, shortcomings and abuses being fearlessly exposed, and care being taken to have all expressed opinions upon technical matters prepared or revised by specialists. What increases its value to the public is this, that since the Congress of the United States refused to grant the appropriation needed to defray the expenses of continuing the publication of the *Bulletin* of the National Board of Health, the conductors of THE SANITARY ENGINEER have performed that work, a display of public spirit which deserves due recognition."—*Iron, London., Jan.* 12.

Subscription $3.00 *per annum, post-paid.*
Newsdealers can supply it at 7 *cents a week.*

The business manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of books treating on subjects in which the readers of that journal have a special interest.

Orders for books are therefore solicited. Address,

BOOK DEPARTMENT,

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

Peter Cooper, whose remains were last week carried to the tomb, died honored, loved and mourned by the entire community. Public feeling at this time when contrasted with that on the occasion of the deaths of other rich men in recent years, is full of suggestiveness. In an age of wealth, extravagance and ostentation, the career of such a man reminds us that things are not as bad as they seem, and that wealth may be a great boon when intrusted to such a steward as he was. The lesson of his life and the spectacle at his death, we trust, will prove an incentive to others of our wealthy citizens to go and do likewise.

It is impossible to estimate the service he has rendered this community in founding and maintaining the Cooper Union, where facilities for obtaining technical instruction are afforded the masses, and multitudes have been enabled to earn a livelihood. This country needs many such institutions, and this seems to be a good time to suggest to those who have accumulated wealth and are considering how they may do good with it, that they examine into the working of the Cooper Union, the Massachusetts Institute of Technology, at Boston, and the Stevens Institute, at Hoboken. These will indicate to them practical methods of rendering for all time a real service to individuals and communities.

The best tribute to the memory of the good man that has gone is to follow his example. It has been well said, "he was born of the people and never forgot his parentage."

DAMS, AQUEDUCTS AND PIPES.

The various class journals published in New York, are discussing the water supply question, each from its own stand-point. When we speak of class journals, we include every daily and weekly newspaper in the city. The partisan press is examining the subject from the political point of view, each paper anxious that the political party with whose views it does not coincide, should not have an undue share of the patronage which the expenditure of fifteen or twenty millions of dollars involves.

The medical journals dwell on the relative purity and wholesomeness of waters stored or freshly gathered, waters from limestone, gneiss or granitic formations, and waters flowing over pebbly beds or peaty meadows.

Now comes forward the *Engineering and Mining Journal*, which thinks that there is "nothing like iron," and wants to know why masonry dams and aqueducts and tunnels in the solid rock should be considered at all, when iron pipes can be used to bring water from remote regions, and is "surprised that the commission has not even referred to such other means as syphon pipes, so largely in use elsewhere, for conveying water."

We know nothing of the processes of reasoning by which the Mayor's commission was led to the decision as to what should and what should not be referred to in its report, but we imagine that it did not deem it essential or advisable to confuse the minds of legislators and the general public by reviewing in detail the suggestions of every advocate who came before it, and particularly deemed it unadvisable to dwell on schemes involving unnecessarily great expenditure.

The bold methods of the California engineers in carrying water supplies many miles across deep gorges and around precipitous mountains, in light wrought iron pipes, with very successful results, excite the enthusiasm and inflame the imagination of many a poetic dweller in our matter-of-fact and plodding Eastern communities, and they wonder why our civil engineers do not also strike out in some new path and project some work that will fire the public heart. And yet, when anything apparently bold, but based on sound scientific principles, and fortified by facts and figures, is presented, they are discontented because some other method, inapplicable under the circumstances, is not proposed.

The need of New York City is a plentiful supply of water. The engineers who have examined the subject propose to furnish that water through a nearly "bee line" tunnel conduit of 12 feet clear diameter, 26 miles long, and deep enough below the surface to be free from accident or wilful damage. To furnish the same amount of water through wrought iron pipes, would require the laying of 32 lines of pipe of 3 feet diameter, the largest size yet used for wrought iron conduits, for at least 36 miles, on a circuitous route, and crossing a number of deep ravines. Such pipes would necessarily be laid on or near the surface of the ground and be liable to be maliciously injured.

It is not a difficult matter to discover that the furnishing and laying of 200,000 tons of wrought iron pipe, would be a heavier burden on the tax payers than the construction of the proposed tunnel conduit, not to speak of the probable complications, resulting from combinations in the iron market over so large an order of material for city use.

The *Journal's* astonishment at the omission of iron from the plans, is supplemented by its fears for the projected dam.

It says, "while no engineer will question the possibility of building a dam capable of withstanding a pressure of 230 feet, or say 100 pounds per square inch, yet under that pressure no common masonry can be counted on to prevent

Digitized by Google

filtration, and no dam that leaks can be considered perfectly safe." It is not too much to say, that in this sentence the facts are distorted and the argument mis-stated. Every description of the proposed dam at Quaker Bridge, states that its height above ground at the highest point will be about 180 feet. In the middle of the valley it may be necessary to excavate a trench, perhaps as much as 100 feet deep at points, which will be filled up partly with solid masonry, probably two hundred or more feet wide, and the rest filled with puddled earth to the natural surface. On this masonry foundation the dam will be built, and the pressure of water it will have to sustain, will be less than 80 pounds per square inch at its base. But suppose some water does filter through it, what harm can it do? The percolation through the joints between heavy blocks of stone cannot wash out those stones. It is not true that a dam which leaks is unsafe, provided that the water passing through does not carry with it the material composing the dam. A leaky earthen dam is dangerous, but a masonry dam in which any water that may by any means find access to the joints is given free exit on the lower side, is safer than one in which the attempt is made to keep the lower face dry. The *Journal's* neat aphorism is "popular science" perhaps, but poor engineering. As for relative danger of injury from breaks, when masonry structures and light iron pipes under great head, are compared, the risk of danger is infinitely greater in the case of the pipes. A stone dam as large as that proposed could not give way all at once, but a single break in one of the 32 pipes at one of the many syphons between the Croton River and the city, would carry desolation sudden and unavoidable down the whole valley in which the burst might occur, and these valleys, be it remembered, are occupied by residences and improved high priced property, unlike the short valley from the Quaker Dam to the Hudson River.

But after all, the *Journal* practically calls attention to a private enterprise, which has been set on foot by some of those mysterious "responsible parties," who are always standing ready to make a contract to furnish something to a great corporation, at extremely reasonable rates. The proposition in this case is to furnish a certain quantity of water from the Ramapo River, crossing the Hudson River by iron pipes, and delivering the supply under some 250 feet head at the city line, "which would probably be sufficient to dispense with steam fire engines. This pipe line plan is cheap and could be completed within a year." Now, with all respect to the "responsible" backers of this scheme, this talk is all nonsense in the present condition of affairs. What New York wants now, is to make provision for the future supply for a good many years, and to own the water, not rent it from a speculative corporation. There are cases where it is advisable for a municipality to allow private enterprise to furnish water as it does gas, making the consumer directly responsible to the owner; but it would be eminently unwise for the city to purchase its water at wholesale from parties whose interest it would be to have as much used as possible, and to sell it at retail to consumers whose desire is to waste the most and pay the least.

In this case the Ramapo source of supply is too limited to be of avail for what New York wants. It is, moreover, directly tributary to the supply of the enormous population congregating on the west shore of the Hudson River opposite New York, the great New Jersey suburb of the metropolis. Even if the legal complications, which are already threatened in connection with this suggested curtailing of the sources whence this district must draw its water, can be averted, it seems to us that a sound public policy would avoid the unnecessary interference with other States, when within our own State an ample water-shed exists, already largely appropriated for the purpose. With the habits of waste which exist, and the leaky condition of pipes and fittings, an increase of the head under which water is supplied would not materially relieve the deficiency. The leaks must be stopped, and we believe that they can and will be as soon as definite plans for the increased supply are decided upon, and the anxiety of the officials to secure charge of the new works removed. Until that question is settled, there will be no systematic effort to make the best of what we have.

In considering the question of who should decide on the plan for an increase in the water supply which is best for the city, we regret to see a suggestion that the matter be submitted to the American Society of Civil Engineers. This is all wrong. This representative Society of Engineers was not organized for, and never should be debased to the gratuitous discussion of special projects, nor should it be brought into the arena of politics. The adoption of plans and the selection of men to carry them out, are not the proper functions of an association of scientific men, the members of which are scattered from Nova Scotia to Japan and are dependant upon their scientific knowledge and experience for their livelihood, and who belong to the society, not for the pecuniary profit it may bring, nor with the purpose of electioneering for nominations to office, but for the professional and social advantages they may derive from intercourse with their fellows, unhampered by the feeling that each man he meets or addresses may be a rival, seeking a weak spot in his armor or an opportunity to pilfer a good idea. The American Society of Civil Engineers has shown itself before now to be jealously guardful of its true exalted position, and we feel sure that its members would, with one accord, decline to have it made an arbiter on special professional questions.

Governor Cleveland's veto of Senate bill 134, amending Chapter 512 of the laws of 1879, giving to gas companies the right to use electricity instead of gas for lighting, is an eminently wise one. Ostensibly this bill appears to be in the interest of such gas companies as may hereafter desire to substitute electricity for gas on account of competition with the electric light companies. In reality it gives to corporations furnishing electricity for light, heat or power, enormous privileges in respect to private property, and it is questionable whether such gas companies as might wish to use electric lights would not be prevented by its terms from so doing. For Section 1 of this bill so amends the original law that it recognizes only "corporations duly organized under the laws of this State for manufacturing and using electricity" for the above-mentioned purposes, and Section 2 expressly mentions these corporations as the ones to which the powers contained in the act are granted. We are unable to learn that the gas companies have had any interest in this bill, or have been in any way its promoters. They are either indifferent or hostile to it. So far as we can judge, the gas companies are not now seeking any legislation of this character, though a measure permitting them to use electricity may be hereafter advocated by them.

Aside from this apparent duplicity, the measure is objectionable for the extraordinary powers it gives a corporation over private property. According to its terms, a company may lay wires or erect fixtures over any private land, the only right reserved to the owner being that, in case of dispute as to the damage done, the County Court shall appoint three commissioners, who shall assess the damage, and this assesment constitutes the *annual rental* for the use of such property by the company. Instead of such annual rental a gross sum may be named as compensation for permanently allowing the fixtures to remain. It is also to be observed that this bill gives these powers over the entire State to any company organized in any part of the State. In view of these facts the veto is an important service rendered to the public by the Governor.

The daily press of this city, in noting the recent outbreak of typhoid fever on Washington Heights near Trini y Cemetery, stated that the Board of Health Inspectors reported the drainage of the district to be perfect and the sanitary condition of the houses inhabited by the persons who contracted the disease excellent. These statements are incorrect; while it is true that the investigations have not thus far resulted in the discovery of the source or means of transmission of the disease, the drainage of the locality where the greatest number of cases occurred is by no means perfect, and the plumbing of one of the best houses containing the disease was conspicuously bad. The investigations of the Board of Health inspectors are being continued, and it is hoped that they will be successful. The Sanitary Superintendent promises to make public in due time a report on the subject, which we look forward to with interest.

LETTERS TO A YOUNG ARCHITECT ON VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U. S. A.

No. XLV.

In my last letter was described, with illustrations, the arrangements for ventilation and heating of the Barnes Hospital near Washington, D. C. Referring to this for dimensions of flues, ducts, etc., I will now give some observations upon the observed results. These are taken from a report which was printed for the use of the Trustees of the Johns Hopkins Hospital, in Baltimore, but which was never published and is now rare. The observations were made and reported by Surgeon D. L. Huntington, U. S. Army, to whose superintendence much of the success of the system was due.

The following are instances of experimental use of the fan:

June 7. External air 75° F.; 5 P.M., temperature of air supply duct 68° F., 20 lbs. steam; 120 revolutions of fan per minute.

Velocity of air at throat of duct (40 square feet area) 1,350 feet per minute, at nearest inlet into ward:

1st story	(100 feet from throat)	450 feet per minute.
2d "	118 " "	420 " " "
3d "	132 " "	340 " " "

At most remote inlet into ward.

1st story	(298 feet from throat)	410 feet per minute.
2d "	315 " " "	220 " " "
3d "	331 " " "	139 " " "

On this trial all registers were open, also all doors, windows, and ventilating outlets, the resistance to the fan being reduced to a minimum.

Nov. 1st. Temperature of external air 45° F., of duct 46° F. 20 lbs. steam; 120 revolutions of fan per minute.

Velocity of air at throat of duct 1,320 feet per minute at the nearest inlet to ward.

1st story	(same distance as above)	530 feet per minute.
2d "	" " "	360 " " "
3d "	" " "	269 " " "

At most remote inlet into ward.

1st story		750 feet per minute.
2d "		500 " " "
3d "		298 " " "

In this experiment all windows and doors were closed, the ventilating registers and outlets being open.

It will be seen that in the first experiment the pressure of the air as indicated by the velocity was greatest at the inlets nearest the fan, while the reverse was the case in the last trial. The direction and force of the prevailing wind also has a very considerable influence on the movement of air through the fan and in the duct. Dr. Huntington remarks that "A long series of experiments at different seasons of the year have all yielded harmonious results. Beyond a velocity of from 800 to 900 feet per minute in the main duct, the effective force of the air is much impaired, and the result usually seen at the inlets nearest the fan is a lessened current. One general rule in working the fan is to use 15 lbs. of steam and not over 60 revolutions per minute, equal to from 400 to 600 feet per minute in the duct; this gives all the air needed for the building and brings the consumption of fuel to its

Digitized by Google

est point. With this velocity air enters the ds at the rate of from two to four feet per ond."

A specially interesting experiment was made one of the wards on the night of Nov. 28, ich is thus reported by Dr. W. M. Mew, who de the air analyses. Ward B (for 12 beds) ntained 11 patients; the ordinary ventilation s going on.

Ward D had 12 beds; all occupied. All the tlets had been closed for 35 minutes before e first experiment, in order to make the air oroughly impure, which was accomplished, as shown by the high percentage of carbonic id obtained.

The second experiment was made in the same ard just ten minutes later, during which time e outlet and inlet flues were open and the fan aking 60 revolutions per minute.

It will be seen from the following table that e use of the fan in this way for ten minutes ade the very impure air of the ward nearly as ure as the outer air:

Air, whence taken.	Temperature. Dry bulb.	Temperature. Wet bulb.	Difference.	Relative Humidity.	Vols. of CO_2 in 10,000.
Outside	49° F.	45° F.	4	73	3.05
Ward B	68° F.	57° F.	11	49	6.35
Ward D, 1st exper.	77° F.	61° F.	16	38	11.23
Ward D, 2d exper.	80° F.	66° F.	14	....	3.75

At the time of this observation there was very little wind, the barometer was 29.72, the temperature in the aspirating chimneys was 79° F., and the average velocity of the upward current in them was 120 feet per minute.

The amount of anthracite coal used for heating the hospital with the external temperature at 39° F., averaged 1.184 lbs. for 24 hours.

The following table shows the observations made of the heating and ventilation of this hospital during the first week in December, 1877. All velocities are stated in feet per minute, and each reported observation is the mean of three trials:

December.	1	2	3	4	5	6	7
Barometer	29.804	30.268	30.230	30.062	29.615	29.771	30.125
External Temperature	38°	31°	33.5	37	53	40	36.5
Wind, direction and force	N. W.	N.	N. W. S. E.	S.	S. W. 0–4	N. W. 4–6	S. W. 1–4
Relative humidity of external air	87	92	66	78	78	58	57
Aspirating chimneys, East. Temperature of chimney	69	75	76	75	75	75	75.5
Aspirating chimneys, East. Velocity of air current	186	280	375	346	326	400	444
Aspirating chimneys, West. Temperature of chimney	70	73	74	73	74	76	73
Aspirating chimneys, West. Velocity of air current	126	150	280	293	150	353	264
Outflow from foul air registers, east wing	200	150	120	139	120	190	240
" " " west wing	210	153	146	113	106	180	213
Inflow of fresh air, east wing	150	205	173	190	306	166	189
" " " west wing	110	166	153	166	340	160	220

" " " at ceiling, west wing	74	72	73	74	74	74	77
Temperature of distal foul air boxes, east wing	72	73	73	70	74	76	73
" " " " west wing	72	70	75	73	77	74	73
Average relative humidity of house	73	71	74	72	75	72	74
	59	45	44	54	56	52	47

Remarks:—December 1. Clear and cool; both furnaces going. Fan not running.
December 2. Calm and cool; both furnaces going. Fan not running.
December 3. Cloudy and still; both furnaces going. Fan running moderately.
December 4. Cloudy with rain; fan running. Both furnaces going.
December 5. Warm and muggy; W. furnace discontinued. Fan not running.
December 6. Fan not running. W. furnace discontinued.
December 7. Clear and cool; fan not running. W. furnace discontinued.

GAS FITTING IN AN OFFICE BUILDING.

Topeka, Kan., *March* 5, 1883.

To the Editor of The Sanitary Engineer:

I am building an office building. I read your queries and replies every week, and would be pleased if you could give me an idea about locating my gas fixtures and meters for the different offices. I have looked over the Mills Building drawing but could not gather much information from it. A drawing in your paper would be thankfully received. Folks out here are not posted much in such matters.

Respectfully yours,

August Anderson.

At the above suggestion of our correspondent, we have had prepared another plan of the eighth floor of the Mills Building, showing the location of gas pipes and fixtures. We suppose the drawing to which he refers was that showing the electric light wiring system, found in our issue of Dec. 21, 1882 (Vol. VII., p. 53). Though the general methods of distribution of gas and electricity in this building are much alike, the plan of one system would hardly serve in place of the other for practical purposes. We have chosen the same floor of the same building in order that the two systems may be directly compared. For the particulars of this description we are indebted to Mr. John Tucker, the foreman in charge of the gas fitting, which was done by Mr. T. J. Byrne.

The whole number of lights provided for in the whole building is about 5,200. The supply pipe from the street to the meter in the cellar is four inches in diameter. But one meter is used in accordance with the practice, now generally adopted in new office buildings in this city, of including the gas bill in the rent. The former plan of having a meter in each office or suite of offices was objectionable on account of the greatly increased danger and annoyance of escaping gas, and the liability of admitting thieves in the guise of meter takers. The omission of separate meters also simplifies the system of distributing pipes and reduces the amount of pipe.

The meter is located near the foot of the vertical main or "riser," shown on the plan, near the rear left-hand corner. Its outlet is 4-inch and from this are taken 3-inch branches to the two risers which supply the main building. Both are in the rear of the building, the one above mentioned being in a recess in the brick wall on the left of the hall leading to a wing (not shown) in the rear, and the other in a corner of a shaft containing the pipes, cables, etc., on the right of the elevators on the back side of the main building. Each is 3-inch to the first story, thence 2½-inch to the sixth, and 2-inch the rest of the way, to the ninth. From these risers are taken branches on each floor to supply all fixtures. On the floor shown in the plan—the eighth—there is one 2-inch branch from each riser. On these branches, as near as convenient to the risers are placed stop cocks. Being under the hall floor, which is tiled, they are rendered accessible by brass deck-screws, set flush with the surface of the floor. The pipes under this tiled hall are in trenches or channels in the concrete under the tile. The division of the building on the left is supplied through one 1½-inch pipe running under the hall. From this main line branches—mostly ¾-inch—are taken to the rooms on either side to supply the side lights on that floor and the centre lights of the story below. The floors of the office rooms are of wood, and over all centre drops and branches are left pockets—two strips of the narrow floor boards about a foot long, fastened down by screws—to give easy access to the pipes at these points for repairs or alterations. The course of the pipes to each fixture is clearly shown on the plan and need not be further explained. The pipes under floors are supported in notches in the floor beams or cross boards between them. The branches to centre lights are ½-inch and to side lights ⅜-inch.

The right-hand division is supplied from two 1½-inch branches, one near the middle of the double row of rooms on each side of the hall, as shown. This plan shows, perhaps, the most common method of distribution from the floor mains, but where practicable, the vertical mains or risers are brought up nearer the centre of the area to be supplied, in order to equalize the pressure at opposite extremities. Of course every building must have a plan peculiar to itself for the gas fitting as well as everything else. In a long and narrow building the best plan might be to have a riser in the middle, with floor mains through a central hall, branching from the riser in opposite directions; while in a large building surrounding a court, the horizontal mains might run near the partition wall between the outside and inside rooms, all around the building, being fed from risers on two opposite sides.

Where meters are required for each office the system becomes more complicated, and as this practice has now passed out of use, as we understand, in the construction of new buildings in this city, we will not illustrate it. The result to be accomplished is the same, however, as in the other case—the most uniform distribution with the least pipe consistent with the plan of the building and the location of fixtures.

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.*

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

(Continued from page 416.)

The taper employed for the conical tube-ends is uniform with all makers of tubes or fittings—namely an inclination of 1 in 32 to the axis. Custom has established also a particular length of screwed end for each different diameter of tube. Tubes of the several diameters are kept in stock by manufacturers and merchants, and form the basis of a regular trade in the apparatus for warming by steam. A knowledge of all these particulars is therefore essential for designing apparatus for the purpose. The ruling dimension in wrought-iron tube work is the external diameter of certain nominal sizes, which are designated roughly according to their internal diameter. These nominal sizes were mainly established in the English tube trade between 1820 and 1840, and certain pitches of screw-thread were then adopted for them, the coarseness of the pitch varying roughly with the diameter, but in an arbitrary way, utterly devoid of regularity. The length of the screwed portion on the tube end varies with the external diameter of the tube according to an arbitrary rule-of-thumb; whence results, for each size of tube, a certain minimum thickness of metal at the outer extremity of the tapering screwed tube-end. It is the determination of this minimum thickness of metal for the tapering screwed end of a wrought-iron tube which constitutes the question of mechanical interest.

FIG. 1.
Thread of 2½ inch tube. Enlarged double full size.

A longitudinal section of the tapering tube-end, with the screw-thread as actually formed, is shown double full size in Fig. 1 for a nominal 2½-inch tube, that is, a tube about 2½ inches internal diameter, and 2⅞ inches actual external diameter.

The thread for pipes employed has an angle of 60°; it is slightly rounded off both at the top and at the bottom, so that the height or depth of the thread, instead of being exactly equal to the pitch, is only four-fifths of the pitch, or equal to $0.8 \times \frac{1}{n}$, if n be the number of threads per inch. For the length of tube-end throughout which the screw-thread continues perfect, the empirical formula used is $(0.8\,D + 4.8) \times \frac{1}{n}$, where D is the actual external diameter of the tube throughout its parallel length, and is expressed in inches. Further back, beyond the perfect threads, come two having the same taper at the bottom, but imperfect at the top. The remaining imperfect portion of the screw-thread, furthest back from the extremity of the tube, is not essential in any way to this system of joint; and its imperfection is simply incidental to the process of cutting the thread at a single operation. From the foregoing it follows that, at the very extremity of the tube, the diameter at the bottom of the thread $= D - \left[\frac{2 \times (0.8\,D + 4.8)}{32\,n} + \frac{2 \times 0.8}{n}\right] = D - (0.05\,D + 1.9) \times \frac{1}{n}$. The thickness of iron below the bottom of the thread, at the tube extremity, is empirically taken to be $= 0.0175\,D + 0.025$. Hence the actual internal diameter d of any tube is found to be, in inches,

$$d = D - (0.05\,D + 1.9) \times \frac{1}{n} - 2 \times (0.0175\,D + 0.025)$$

$$\text{or } d = 0.965\,D - 0.05\,\frac{D}{n} - \frac{1.9}{n} - 0.05.$$

For the various sizes of tubes, ranging from ⅛ inch to 10 inches nominal internal diameter, with their corresponding numbers of screw-threads per inch, the actual internal diameter d is expressed by the following Table I. in terms of the actual external diameter D.

TABLE I.

Diameters of Wrought-Iron Welded Tubes for Warming by Steam.

Nominal Internal Diameter of Tube.	Number of Screw-Threads per inch.	Actual Internal Diameter d in terms of actual external diameter D.
Inches	No.	Inches.
⅛	27	$d = 0.9631\,D - 0.1204$
¼ and ⅜	18	$d = 0.9622\,D - 0.1556$
½ and ¾	14	$d = 0.9614\,D - 0.1857$
1 1¼ 1½ and 2	11½	$d = 0.9607\,D - 0.2152$
2½ to 10	8	$d = 0.9587\,D - 0.2875$

The number of screw-threads per inch for the several sizes of tubes is here accepted from customary usage. It is the workman's approximation to the pitch practically desirable, and much reluctance must consequently be felt in calling it in question. Still it would have been better to investigate the general case upon the basis of a pitch ranging in closer accordance with the range of tube diameter. Thus, the nominal ½-inch tubes might have had 16 threads per inch; ¾-inch, 14 threads; 1 and 1¼-inch, 12 threads; 1½ and 2 inches, 11 threads; 2½ to 3½ inches, 10 threads; 4 to 6 inches, 8 threads; 7 to 9 inches, 7 threads; and 10 inches, not more than 6 threads per inch The existing numbers of threads however, are now too well established to be disturbed: at all events they must be taken in any statement of present practice.

The smaller sizes of tubes, up to and including 1¼ inch nominal inside diameter, are butt-welded, and are proved by hydraulic pressure to 300 lbs. per square inch. The larger sizes, commencing with 1½ inch, are lap-welded, and are proved to 500 lbs. per square inch by hydraulic pressure. The question of butt-welding or lap-welding is simply one of economy in manufacture: it is not easy to make lap-welded tubes of less than 1½ inch inside diameter, while it is cheaper to make lap-welded than butt-welded tubes of that size and upwards. The proving pressures here given are far below the ultimate strength of sound welded tubes; and when required the test is increased to double or treble these pressures.

[TO BE CONTINUED.]

A JOB WHICH CAUSED A NUISANCE.

NEWBURYPORT, *March* 12, 1883.

To the Editor of THE SANITARY ENGINEER:

I send you sketch of a job representative of the work usually done in this place. The worst feature about it is that it has been done within two years under the supervision of our best (?) architect. This work is in our public reading room attached to our public library. The reading room was a gift—or rather the money that built it, to our city, and the idea of the donor and trustees having the matter in charge was to have everything as good as money could buy.

How well they succeeded as regards the sanitary arrangements, the following description of sketch will show. *F* is a space running from cellar to attic, between outside brick wall and lath and plaster partition. *T* is a 3-inch tin pipe running from near the receiver of pan closet to inside of space, which is utilized as a sort of ventilating shaft by the architect. Into the bottom of this tin pipe a lead pipe, *V*, is run from receiver, as shown, the space between the lead pipe, which is ¾-inch, and the 3-inch tin pipe being left open. *V* is lead pipe from other receiver direct to this space. *P P* are ¾-inch lead pipes from a cistern, *C*, at least 30 feet from closets, as the pipes run, and they are run far from direct, and in the crooked "hanging" manner, as shown. The service boxes are very small and the valve inside but 1¼ inches, consequently the flush is a mere trickle of a quart of water. The waste pipe *L* from basin *B* is 1¼-inch, with trap connected exactly as shown; *W* is cast iron 2-inch pipe, and *L L* 1¼-inch lead from urinal and basins with putty joints at *J J*. The soil-pipe *S* runs direct to a cesspool a few feet from cellar wall, without trap, air-vent or ventilation of any kind, the cesspool being covered over with turf. The cesspool is of the loose, no bottom, open-sided kind, built to have liquids soak away as fast as possible. The joints in soil pipe are supposed to be lead, but they are so covered with putty as to make it doubtful; but lead or putty, they nearly all, if not all, leak.

To my personal knowledge there has been a terrible stench in the building from the time this work was a month old, but no one seemed to notice it, till last week the pipe at cellar wall either froze or got stopped, and the result was the cellar bottom covered with filth, the water oozing

Digitized by Google

and streaming from nearly all the joints. Now, the building is heated by steam indirectly by coils of 1-inch pipe, running all around on the outside cellar walls directly under the floor. These coils are enclosed in a tin-lined box, perforated on the bottom, so as to take the air from the cellar. The boilers, coal pen, and ash pen are all in this one open cellar.

The air from the shaft *F* is diffused through the whole building between floors, in partitions, and into the library building itself. I find it is impossible to awaken any interest iu sanitary matters here, even our Board of Health being loth to do anything because public opinion is against them. If of any interest to you, I will send you sketch of the work in our City Hall, done last year at considerable expense. Some parts of it are even worse than at the library. Have you any subscribers to your paper in the city besides myself? I ask for the reason I wish to know who has *any interest* in sanitary matters. Nature has endowed our city with advantages above any place I ever saw, and yet our death rate is between 22 and 23 and our population 15,000. Our people are mostly native; very few foreigners. We have no sewerage and depend on loose cesspools and privies, and until this year no water supply other than wells sunk alongside these same cesspools.

Pardon me for intruding so much on your time, but the interest I feel in this matter has induced me to write more than I intended at first. "S."

[We have no means of knowing how many readers we have in Newburyport, since newsdealers furnish the paper to a considerable extent in the Eastern and Middle States. From our correpondent's description of the condition of affairs in that place, we should assume that THE SANITARY ENGINEER was not much read there. We shall be glad to receive the sketch referred to.]

VENTILATION OF THE PUBLIC SEWER INTO A BEDROOM.

The following case of dangerous plumbing recently came to the notice of the Health Department of this city, in this way. The occupant of a fine house on Fifty-eighth street, near Fifth avenue, after much unaccountable sickness in his family, requested the Board of Health to make an examination of the plumbing. These are some of the defects the inspector found. The earthenware house drain under the cellar floor had defective, leaking joints, allowing sewer gas to escape through the house, since there was no trap on it. The water closets on the second and third stories were connected to the soil pipe without ferrules allowing gas to escape at the joints. The water sup-

ply for the upper floors was insufficient. The sheet lead safe waste pipes connected into the waste pipes of fixtures on each floor. A basin in a bedroom had direct communication with the street sewer, (there being, as before stated, no trap on the main drain,) by being connected into the vent from the crown of the trap under another basin, and having no trap on its own waste pipe, as shown in the accompanying sketch. The connection of the basin having the trapless waste pipe, had originally been made into the waste pipe of the other basin above the trap (as shown by dotted lines), but when the plumbing was overhauled a year or two ago, a ventilating pipe was attached to the trap, and the other basin waste connected to it as shown.

Correspondence.

PLUMBERS' PROFITS.

PHILADELPHIA, PA., *April* 7, 1883.

To the Editor of THE SANITARY ENGINEER:

In response to your request for the views of your readers on "plumbers' profits," I would say that the profits of a plumber's business depend entirely on himself, and just here is the secret of the whole matter.

There are two classes of plumbers; one class respect themselves and consequently have the respect of their customers and the community generally. This respect is secured by being perfectly reliable and honest to the core, not by saying, you give a dollar's worth of material and labor, accepting a dollar or less in return.

My advice is, provide the best material in the market, arrange the work and construct it in an intelligent and workmanlike manner, and see that your workmen carry out the design to the letter. The man who conducts the plumbing business on this line will do good work and get fair profits. I grant he may not do as large a business, but what he does will be good, and generally he will get his price, for, after all, most of the people are willing to pay for work which they know is honestly done. I would rather be known as a high-priced plumber, doing good work, than as a cheap one and a miserable botch.

The other class of plumbers is what should be termed by every honest man, *a scab*—who will take one hundred dollars' worth of work for sixty dollars, and then take off ten or fifteen per cent. for cash, prostituting the business, botching everything they touch, simply because they have nothing at stake but to get the money. This is a brief description of the second class.

There is in every city a certain amount of work to be done every year. My advice is, do it well, demand your price, making it a fair one, and let the material men and bonus builders alone; they will injure themselves more than you if they do the wrong thing. Let the plumbers be fair to themselves and the profit will be satisfactory.

Yours respectfully,

1721 Chestnut St. JNO. WORTHINGTON.

BOSTON, *April* 9, 1883,

To the Editor of THE SANITARY ENGINEER.

I have been very much interested in Mr. Moody's letter, on the above subject, which I find in your last issue.

It is pleasing to consider that a change, such as my Worcester friend speaks of, is growing in the hearts of the people in his city.

I do not deny the progress that is going on here in the same direction, but I must confess it is rather slow, and we may all grow gray before it is perceptible. To use Mr. Moody's words, it is very unsatisfactory all around.

I am not one of those who are disposed to attribute all the blame to the dealers in our material; we are as much at fault as they.

I hold only one thing against the dealer, and perhaps I may not be correct in that. That is, as I am credibly informed, he allows a certain class of hangers on about his place, and ships them regularly as you would merchandise, to fit up the material sold directly to the purchaser, who labors under the impression that he has made a big thing in his bargain.

Now all I have to say in this connection is, that the consumer not only gets inferior labor—men who cannot obtain work in any shop, and have to hang around the dealers back door, to curry favor with the porter, but it costs him fully fifteen per cent. more, admitting that he purchased the goods for less money than he could obtain them by calling on the plumber.

Very Respectfully, J. T.

FLUSHING URINALS.

To the Editor of THE SANITARY ENGINEER:

Are urinals ever fitted with automatic flushing arrangement similar to that used with water closets, either by valve or cistern supply? Are cisterns anywhere generally used for flushing urinals? Is there any objection to flushing them direct from the general supply pipes?

D. C. B.

[We know of no valve supply to urinals that is automatic. Flush tanks both of the syphon and tilting type are frequently used. In England the supply is always from a cistern. We consider a direct supply objectionable, though the risks involved depend very much on circumstances, which vary greatly. The question is one on which a great deal can be said, and to which we shall probably revert at another time.]

LEAD BURNING.

ST. PAUL, MIN., *March* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

I have some small boxes, 2-feet square, to line with sheet lead, for chemical purposes. They want the seams "burnt" instead of being soldered. I never did any sheet lead burning and would be very happy to get a few instructions from you or some of your readers who understand it.

Is there any way to do it without a lead burning apparatus? What do they cost, and where can they be purchased? Is there anything used on a seam which is being burnt that takes the place of rosin or grease on a seam being soldered?

By answering the above you will greatly oblige a constant reader. Yours respectfully,

J. J. HUDNER.

[We would refer our correspondent to Mr. Thomas Walker, Kansas City, Mo., who has a machine for this purpose, with which, we believe, is furnished full instructions for lead burning. We described Mr. Walker's apparatus in our last issue.

CHICAGO PLUMBERS' SUGGESTIONS.

[From our Special Correspondent.]

CHICAGO, *April* 5, 1883.

The Master Plumbers' Association met this evening, President Daniel J. Rock in the chair and Alex. Murray Secretary, with some thirty other members present.

The following committees were appointed to arrange for the annual entertainment, April 20, embracing literary features, a banquet and a ball:

Reception Committee, Messrs. McGinley, Oliphant, Alles, Powers, Boy.

Floor Committee, Messrs. Ross, Enright, Teppel, Conlin, Reilly, Sims, Wade, Hickey, Ruh, Griffith, Gay, Roche.

Committee on invitations, The President and Secretary, with Aldermen Ryan and Sanders and Messrs. Gilmore, A. Young, Whiteford, Hamlin.

A very pretty badge was adopted, representing Hygeia in the midst of sanitary devices and surroundings worthy of the young and buxom Goddess of Health.

The Chairman of the Sanitary Committee, Andrew Young, presented the following, and it was adopted:

"The Sanitary Committee would call the attention of the Association to much of the so-called ventilation of soil pipes in old houses, the material used, extending up through the roof, being entirely unfit for the purpose, tin and iron pipe being used on account of their cheapness, and the iron work done by men who have no knowledge of the end in view. With such make-shift ventilation the remedy will be found in substituting first-class material, as the tin and galvanized iron pipes will not last for any length of time. Pipes should, if possible, be vented of the same material as the pipe itself and of the same size."

The paper of the evening was an interesting one, the subject being "Plumbing" and the essayist, J. J. Wade. Some full extracts may equally benefit and entertain the readers of THE SANITARY ENGINEER, and especially the plumbing fraternity:

"Let us go back a quarter of a century; we find the men then engaged in this business were held in high esteem, and upon careful research and thought I have unraveled the problem why they escaped the jibes, the jeers, and the suspicions too often vouchsafed to their successors now-a-days. Laboring under many disadvantages, compared with us of to-day, being obliged to make their own lead material by hand, they were, through necessity, good mechanics. To become so they served a full term of apprenticeship, to serve which required practice, head-work, aptitude for the business and a zeal to master all the details of a calling chosen for a life-time. In one word, what they professed to do they were masters of.

"Gradually since that time abuses have crept into our craft, enhanced through the complications brought about by the advance of the march of civilization, making greater demands on our intellectuality and thoroughness, which as a body we have not supplied, till we have been looked upon by a large portion of the public as a necessary evil. The core of the trouble is the lack of thoroughness in men who have entered our craft, though totally unfit to carry on their business, lacking the practical knowledge in the first place, and ready to jump into another business the next year, if it holds out greater inducements. All this is the result of the *practical* disappearance of apprentices. Twenty-five years ago it was deemed absolutely necessary to serve an apprenticeship of five years to become a master plumber; to-day the only requisite required to become one is to have capital sufficient to open a shop and hire a few men in whose ability he places confidence. I consider it our most pressing duty to do all in our power to remedy this evil. To do this successfully we must elevate the standard of our profession. I call it a profession, as it requires more to-day than a good mechanic to become a master plumber. More is required of us than merely laying pipe according to specifications; more is required of us than simply to stop a leak in a pipe; the system of drainage and sewerage, unknown twenty-five years ago,

Digitized by Google

has added complications which make a knowledge of ventilation compulsory, requiring intellect and study as much as does the study of medicine, and, at no far distant day, the plumber in our cities will enjoy the confidence of the public."

The speaker exploded successfully the too common idea that there was anything lowering in the plumber's work, and took off happily, and amidst laughter, the apprentice boy who threw up the sponge:

"The ridicule so generously lavished upon us has struck him through, and he falters in his determination to 'stick it out.' He leaves, and, turning up behind the counter in a dry goods store, parts his hair in the middle, wears good clothes all day, and soars to the startling salary of $15 a week. A good plumber must of necessity be a gentleman. The general health of the community is placed in our hands, and the community has a right to expect intelligent, trustworthy, and conscientious men to look after its sanitary condition.

"Chicago to-day is as free from sewer gas as any other large city in the Union. I believe, so far, we have met all the complications arising from our vast system of sewerage, which runs practically under a flat surface, the grading being limited. But let us not remain idle, still more is justly expected of us; let us stand united and aid each other with counsel and advice.

"This Association, which was formed about a year and a half ago, in point of membership is next in strength to that of New York. It is the third organization formed by Master Plumbers in this country, and it was formed for the same reasons that the Associations of Brooklyn, New York, Washington, Baltimore, and other cities owe their existence and welfare to—necessity, stern necessity, and nothing else. It is fresh in the minds of everyone present here when but a few years ago we should have looked upon the fraternizing of the Master Plumbers as the mixing of oil and water, when jealousy ran so strong that each plumber believed that the town was only large enough to hold him, and him alone."

The speaker depicted the pecuniary loss and other baneful results that followed, and continued:

"The forming of associations, forging a strong band of union, is to-day not confined to us in Chicago, nor to a few large cities in the Union, but bids fair now to invade every village and hamlet in this great country. For the short space of time this Association has been in existence it has done wonders. It has established unity, it has done away with existing abuses and wrongs, as you all know, and it has established the great principle of our trade, that we, the 'Master Plumbers,' demand protection in the plumbing trade. And this Association has demonstrated successfully that when we are united our just demands have to be complied with.

"The plumbers of the Northwest are looking to us for counsel, advice, and experience, as has been shown by the number of letters we are in receipt of. Our Association is the nucleus of a bond of union among them, and in a very short time I hope—if only we steer clear of the rock of dissension, clearly enough marked out on the chart—to see this entire country present a unity of the plumbers, when the abuses and wrongs which now exist will be known no more. And when, in the National Congress of the Master Plumbers of the United States, the delegates of this Association of Chicago give their counsel, it will command the attention of that body as due the most energetic and united body forming part of the great National Congress."

CONCRETE WATER-PIPES.

In a late number of the *Annales des Ponts et Chaussées*, a cheap method of making water-pipes of small diameter is described. The pipes were formed of concrete in the trench itself. The mould into which the concrete was stamped in was of sheet-iron, and had a length of about two yards. The several pipes were not specially joined to each other, the joints being simply set with mortar. The concrete consisted of three parts of slow-setting cement and three parts of river sand, mixed with five parts of limestone *débris*. The inner diameter of the pipes was 9 in.; their thickness, 3 in. The average fall is given at 1:500; the lowest speed of the current at 1 ft. 9 in. per second. To facilitate the cleaning of the pipes, manholes are constructed every 100 yards or so, the sides of which are also made of concrete. The trenches are about 5 ft. deep. The work was done by four men, who laid down nearly 200 ft. of pipes in a working day; the cost was about 3*s*. 9*d*. per yard run. It is claimed as an advantage for the new method that the pipes adhere closely to the inevitable inequalities of the trench, and thus lie firmly on the ground. The work was carried out by M. Thanneur for the water-mains of the town of Coulommiers. It may here also be mentioned that in the course of the Canal du Verdon, which supplies the town of Aix-en-Provence and the neighborhood with water, several mains were carried in a similiar manner. Bnt the concrete pipes which are submitted to great pressure have not proved effective. The method, consequently, is only suitable for pipes in which there is no pressure, or only a very trifling one.—*Builder.*

SMALL SECONDARY BATTERIES.

Engineering describes the secondary batteries which were used to maintain the lamps on the heads of the piers in "Iolanthe," when performed at the Savoy Theatre. Each star consisted of a small incandescence lamp of two or three candle power, connected by flexible conductors to a secondary battery attached to the back of the wearer and concealed, either by a mass of hair or a pair of wings. One of these batteries is shown in the accompanying view, where it will be seen to consist of a gutta-percha box provided with two hooks for its attachment, and a board to prevent it soiling the dress of the wearer. The interior of

the box is divided into two cells, in each of which are two lead plates "formed" by alternate charging into a Planté battery. The positive plate of one cell is joined to the negative of the next, while the remaining pair of terminals are brought out for the attachment of the conductors from the lamp. In charging the stoppers are withdrawn to allow the gases to escape, and all the batteries coupled up in series, after which a current of two or three ampères is sent through them for one hour. When fully charged each battery, which weighs about four pounds, is capable of maintaining a lamp for about an hour.

REPORT ON FOOD ADULTERATION AND ILLUMINATING OILS.

The following is the report of the Sanitary Committee of the State Board of Health for 1882. It includes the results obtained in the enforcement of the Food and Drug Adulteration law, and also those under the law for regulating the sale of illuminating oils.

I. ILLUMINATING OILS.

On June 6 an act was passed by the Legislature regulating the standard of illuminatidg oils.

(This law has been already reprinted in THE SANITARY ENGINEER, Vol. VI. p. 52.)

This subject having been under discussion ever since the Board was organized, and a careful investigation having been made, under the supervision of this committee, of all the most important oil testers used in this country and in Europe, by Arthur H. Elliott, Ph. D., the results of which were published in the annual report for 1881, the Board was able soon after the passage of the act to adopt, in accordance with Section 3 thereof, the instruments and methods employed in this State for testing oils.

(A description of the apparatus adopted, together with the resolutions relating to its use, have been given in our columns and we omit their repetition here.)

These resolutions, together with the law, were printed and freely distributed throughout the State. The public analysts were supplied with the new tester, and carefully verified thermometer; and manufacturers and dealers were instructed in regard to the test.

Nine kerosene accidents have been investigated by Mr. Albert L. Colby, Inspector, four resulting in loss of life, and several others in great suffering to the victim, and in considerable loss of property. Four occurred in New York city, two in Brooklyn, one in West New Brighton, on Staten Island, one at Batavia, and one at Herkimer. Besides these cases, three others of alleged accident were investigated, which proved to have been due to other causes. The details of these investigations are presented as an appendix to this report. Nine other accidents came to the knowledge of the Sanitary Committee, which it was not possible to investigate, for various reasons.

The flashing point of the oils which gave rise to these accidents varied from 80° to 97° Fahr., a very significant fact, which proves conclusively that the standard 100° Fahr. adopted by this Board is not too high, as some have suggested.

As to throwing additional light on the proper standard of temperature to be fixed in determining the safety of these inflammable oils, I take the liberty of presenting the results of investigations made some time since to ascertain the temperature actually reached by oil in lamps under different conditions. Twenty-five lamps of different patterns were selected. They were all filled with the same oil, and were allowed to burn for several hours; from time to time the temperature of the oil in the lamps was carefully determined. These experiments were repeated on different days, to ascertain the effect of the atmospheric temperature.

The results are given in the following tables:

(For want of space we give only a synopsis of the results obtained in each of the three series of experiments).

FIRST SERIES.

	23 *Lamps.*	11 *Metal Lamps.*	12 *Glass Lamps.*
Highest temperature reached....	120° F.	100° F.	86° F.
Lowest temperature reached...	76	76	76
Average temperature.....	83	86	81

SECOND SERIES.

	25 *Lamps.*	12 *Glass Lamps.*	13 *Metal Lamps.*
Highest temperature reached...	120° F.	91° F.	120° F.
Lowest temperature reached.....	82	84	82
Average temperature	91⅙	86	96⅙

THIRD SERIES.

	25 *Lamps.*	13 *Metal Lamps.*	12 *Glass Lamps.*
Highest temperature reached....	129° F.	129° F.	98° F.
Lowest temperature reached.....	84	84	85
Average temperature	98¾	104½	92⅓

In the first series of experiments the temperature of the room varied from 73° to 74° F.; in the second from 82° to 84° F.; and in the third from 90° to 92° F.

Since September 1, when the work was organized, 236 samples of oil have been procured, in different parts of the State, and subjected to examination by the public analysts. Of these, twenty-two samples flashed, or emitted combustible vapor, at the ordinary temperature of the laboratory, before heat was applied, that is between 73° and 75° F. Thirty-three samples only stood the test provided by law. Of these thirty-three six flashed at scarcely 100°, two at 101°, twelve at 102°, one at 103°, five at 104°, three at 106°, one at 107°, one at 108°, one at 109°, and one at 110°. Two hundred and two samples out of the 236 purchased failed to stand the State test, one sample was too small in quantity to be tested. The table below exhibits in detail the results of the tests.

The Committee further report that Mr. J. M. Partridge, Fire Commissioner of Brooklyn, has adopted the instrument of the State Board, and will prosecute offenders in future. The law is now uniform for all parts of the State excepting New York city, where the charter of the city directs the Fire Commissioners to fix the instruments which shall be used in testing oils.

At the meeting of this Board, held in November, when this matter was under discussion, the following resolution was adopted, and subsequently sent by the Secretary to the Fire Commissioners of New York:

WHEREAS, According to the provisions of Chapter 292 of 1882, the standard safety test for kerosene oil throughout

ELECTRIC LIGHT NOTES.

The posts for electric lamps on the East River bridge are being erected.

The Fulton street station, of the New York Elevated Railroad, is now lighted from the Edison Central Station, each former gas jet being replaced by a 16 candle power, incandesent lamp.

The Hartford Electric Light Company, elected officers last week, and decided on the arrangement of their installation. They have adopted the system of the American Electric and Illuminating Company.

A senate joint resolution passed last week, changing the name of the American Electric Company, of New Britian, Ct, to the Thomas Houston Electric Company, gives the corporation the right to increase the stock $1,000,000, divided as at present into shares of $25 each.

London *Times*; describing the electrical exhibition at the Westminister Aquarium, mentions a lamp, said to be 100,000 candle power, over the organ in the main body of the exhibition building, driven by an Elphinstone-Vincent dynamo. Another of these dynamos supplies 350 swan lamps, 20 candle power each in the smoking gallery. In the dining annex are 440 Swan lamps supplied by a Thomson-Ferranti machine. The lamps are divided into four series of 110 lamps each. In this same annex is a Dowson's economic gas producer supplying gas to an Otto gas engine 3½ horse power, which drives a Siemens' dynamo.

President White of Cornell University, states in a circular recently issued, that at the begining of the next academic year, (Sept. 18, 1883), students will be received in a course in electrical engineering. The general studies of the course, are mainly those of the departments of civil and mechanical engineering. The special studies embrace the theory of electricity, the construction and testing of telegraph lines, cables and instruments, and of dynamo machines, and the methods of electrical measurement, electrical lighting, and the electrical transmission of power.

The City Council of Nashville, Tenn, have received propositions from both the Nashville Gas Company and from the Brush Electric Light Company for lighting the streets. The latter offer to maintain 50 lights of 2,000 candle power each, every night in the year, for four years, at 65 cents a night per lamp, or 200 lamps of equal candle power for ten years at 60 cents per lamp a night. The company claim that the 200 lamps will give 50 times the amount of light given at present by gas. The Gas Company submitted four propositions, ranging from 3 cents per lamp a night for four-foot burners burning seven hours a night, to 6⅓ cents per lamp a night for six-foot burners 10 hours a night, the totals ranging from $7,938 per annum to $17,190, if the city has charge of lighting, cleaning and repairing, or $22,190, if these are left to the Gas Company. The number of gas lamps is between 700 and 800, and the local paper averages the propositions at $16,900 for the gas company, and $43,200 for the electric light company, giving 20 times as much light.

Meter-ites.

Mr. Chamberlain, of the English Board of Trade, states that the Board will soon undertake extended experiments on the relative powers of gas, oil and electricity as illuminants for lighthouses.

The bill regulating the price of gas, and providing for inspection of meters in New York and Brooklyn, reached a third reading in the Assembly last week. It provides that the maximum price for gas shall be $1.50 per 1,000 cubic feet of 6 candle power.

Another so-called explosion of sewer gas in a sewer is reported, this time from Baltimore, where it seems a boy threw a lighted match into a sewer, whereupon an explosion followed, which tore up the street and buried two boys in the débris. We may refer for the probable cause of such explosions to an editorial in our issue of February 22, 1883.

The annual meeting of the Montreal Gas Company last week brought out remarks by the President, Mr. Jesse Joseph, and others, which are of general interest to gas consumers and gas producers. The President, in answer to inquiries, stated that a reduction in price of 20 per cent. had been made, yet the consumption had increased during the twelve months $16,000. The demand for gas stoves was increasing. They had last year furnished 100 of them to customers, and expected to supply 200 the coming year. As to gas lost by condensation, the President thought it reached about 20 per cent. Another member thought the company would find it necessary to supply cheaper gas for heating, and that prices would have to fall to 75 cents for heating gas and $1 00 for illuminating gas. He thought the charge for meters should be abolished, and a large discount allowed to large consumers.

Health Commissioner Raymond, of Brooklyn, has received a communication from the Aldermanic Committee on Lamps and Gas, requesting him, in consequence of the alleged frequency of deaths from the inhalation of water gas, to cause to be made an analysis of the gas known by that name as manufactured by the Fulton Municipal Gas Company of Brooklyn, and also of the coal gas manufactured by the Brooklyn Gas Light Company, and to investigate to what extent the use of water gas is more dangerous to public health and life than is the use of coal gas; also to cause to be compiled a list of all deaths caused by the inhalation of illuminating water gas in the cities of Brooklyn and New York since its introduction in 1878, and a list of all deaths caused by inhalation of illuminating coal gas since its introduction in Brooklyn in 1849, and in New York city since 1878, together with the proportion of each gas used in these cities during that period. They also request the commissioner to inform them in what States of the Union the use of water gas, or any gas containing more than 10 per cent. of carbonic oxide, has been prohibited by law.

NORFOLK SEWERAGE.

Norfolk, Va., *March* 26, 1883.

To the Editor of The Sanitary Engineer:

The trial section of the Waring system of sewerage in our city has been completed and is now in running order. As yet no houses have been connected, the delay being occasioned by the committee in charge not having as yet decided upon an ordinance to regulate the plumbing. I send you a printed copy of the various ordinances submitted to this committee, in order that I may get your valuable judgment in regard to several conflicting laws between the first of the printed ordinances and the one submitted by my self.

I am nearly entirely indebted to your valuable publication, The Sanitary Engineer, for many of the laws submitted, and should I have been mistaken in any of my deductions, that publication would be the most acceptable source of correction.

In regard to difference of requirement between Section 2 of first ordinance, and Section 3 of mine, the decision can only be regulated by circumstances. In Memphis it was comparatively easy to force a people who had just emerged from the terrors of a devastating plague, to make connections with the sewers; but it is quite another thing to force hot-blooded Virginians, untutored as yet in sanitary science, to spend their scanty means to abolish that which they have not been taught to consider a danger or a nuisance. In the hands of fearless and efficient health commissioners, Section 3 of my ordinance would be sufficiently powerful to produce equally as effective results as would an irritating compulsory ordinance. It is simply needful to define strictly what the health officers shall consider a danger or a nuisance, and the law would give them the power to eradicate it.

I have hinted that our people as a mass are poor, and for that reason it is desirable that our ordinance should only make its regulations compulsory so far as the absolutely vital principles of house drainage are concerned. The most important of these principles are, that the appliance used should be, perfectly tight throughout, that is, practically impervious to gas and water; should have a continuous fall from head to outlet, and should be perfectly ventilated. Upon the first two of these principles these ordinances agree, but in the third we differ widely.

Section 7 of first ordinance demands that no trap or any manner of obstruction to the free flow of air through the whole course of the drain and soil pipes will be allowed, and the same shall be four inches in diameter from the public sewer to the top of the ventilating pipe.

I differ with them here, and insist that except in the case of out-houses, separated from the dwellings, a running trap and air inlet shall be provided between the house drain and the street, with a special ventilating pipe four inches in diameter throughout its length, of cast iron; the same to be placed on the side of the trap *next to the sewer*, and to extend above the roof.

The great characteristic of the Waring system in this city is the good grades on which the pipes are laid, and I have every faith in the quick removal of all dangerous substances from every part of the sewered sections, and believe that the system can be kept in perfect running order if

Digitized by Google

properly managed; but the question now is, will the system always be properly managed? If so, I should assuredly recommend that the running trap be abolished; but until I feel that the governing officers of the work will not be appointed for political power, but solely in accordance with their qualifications as custodians of the public health, I would not advocate the abolition of traps on waste pipes What is your conviction in regard to this subject?

I am, yours very truly,

RICHARD LAMB,
Constructing Eng, Norfolk Sewers.

The following are the provisions in controversy:

AN ORDINANCE.

SECTION 1. It shall be a misdemeanor for any person to do, or cause to be done, any of the following acts, on territory which can be drained into the sewer, except as herein provided, and any and all such persons guilty thereof shall be fined not less than....dollars nor more than.... dollars for each offense.

SEC. 2. For the owner or occupant of any building of which any portion is used for any purpose during any part of day, to fail to have at least one water closet connected with the public sewer ...days after notification by the Board of Health, or their authorized agent, such water closet to be suitably arranged for a urinal, unless a separate urinal is provided.

SEC. 3. For the owner or occupant of any building in which food is cooked or clothing is washed, to fail to have a suitable sink, slop stone or hopper for the reception of waste water.

SEC. 4. To throw or allow to be thrown, or deposited on the surface of the ground, or in any hole or vault in or under the surface of the ground, any water which has been used for domestic purposes, or any liquid or solid filth, or fæces, or urine.

To allow any surface water or rain water from the ground or roofs of houses to enter any sewer or drain or any vessel or slop stone connected with any sewer or drain, or to admit any drainage water from any cellar to a sewer; provided, however, that drainage for cellars may be provided in accordance with the regulations and plans to be found in the City Engineer's office.

SEC. 5. To throw or cause to be thrown in any vessel or receptacle connected with a public sewer, any garbage, hair, ashes, fruit or vegetables, peelings, rags, cotton, cinders, or any other matter or thing whatsoever, except fæces, urine, the necessary closet paper and liquid house slops; or to use or cause to be used any house drain for any other purpose than those specified in this ordinance, except by special permission of the Board of Street, Sewer and Drain Commissioners.

SEC. 6. It is hereby made the duty of the Board of Health, through their Sanitary Inspector and the Police of the city, to enforce the foregoing provisions of this ordinance, and of the Board of Street, Sewer and Drain Commissioners, to supervise the plumbing and sewer connections, and to establish and promulgate such regulations for the same as they may, from time to time, deem proper.

Any person who shall neglect or refuse or comply with the requirements of such regulations, when promulgated, shall be liable to the penalties described in Section 1.

PLUMBING REGULATIONS.

SECTION 2. All soil pipes above ground shall be of iron, with lead or screwed joint, four inches in diameter, and shall be extended full size through the roof of the house.

SEC. 6. All iron soil and drain pipes shall be coated inside and out with coal tar, applied hot, and the four-inch cast iron pipe used shall weigh not less than 13 lbs. per lineal foot.

SEC. 7. No trap or any manner of obstruction to the free flow of air through the whole course of the drain and soil pipes will be allowed, and the same shall be four inches in diameter from the public sewer to the top of the ventilating pipe.

MR. LAMB'S ORDINANCE.

SECTION 1. Be it ordained, etc., the Board of Street, Sewer and Drain Commissioners shall have charge of the construction and keeping in order of all public sewers and drains.

SEC. 2. That their Engineer shall supervise the construction and repairs of all sewers and house drains, and shall keep a description with plans of the sewers, and an account of all expenses in his department.

SEC. 3. When the Board of Health shall deem any privy, cesspool or house drain to be a nuisance, or a danger to the health of the public or inmates of the house, they shall require the house to be drained and a connection with the public sewers to be made, in accordance with the rules and regulations of this ordinance; and in case of a neglect to do this within two weeks from the time of the receipt of the requisition of the Board of Health, the Board may instruct the Street, Sewer and Drain Commissioners to make such drains and connections at the owner's expense, the cost to be collected the same as city taxes.

Regulations for Planning House Drainage.

1. For each building there shall be a separate connection with the public sewers of four-inch salt-glazed vitrified pipes, which may extend from the curb, joining these with the public house connection pipes to within two feet of the house, the same to be jointed with oakum gasket and good cement, and from there the house drain shall be four-inch cast iron pipe, weighing not less than thirteen pounds per foot, with bells made sufficiently thick to make safely an air-tight wiped lead joint; or shall be made of four-inch wrought iron pipe, screw or wiped lead joint, coated with ashphalt to protect it from rust. This pipe shall extend upward as a soil pipe above the roof.

2. If the house drain runs under or through the house, a running trap and air inlet shall be provided between the house drain and the street, with a special ventilating pipe four inches in diameter throughout its length, of cast iron; the same to be placed on the side of the trap next to the sewer, and to extend above the roof.

Rules for Drain Laying.

5. In out-houses that are used for no other purpose than water closets, the running trap on the waste-pipe may be dispensed with, as well as the four-inch supplementary vent pipe. All fixtures, however, must be efficiently trapped, and each trap ventilated as directed in Sec. 4, Rule 3, of this ordinance.

[The points in these ordinances about which our views are asked seem to be questions that local considerations should control. We are not sufficiently acquainted with the situation to justify us in giving an opinion.

As to the regulations, it seems that Norfolk has selected a special system of sewerage in which certain details are claimed by its designer to be essential features. Without either condemning or endorsing all these details, we would venture the opinion that inasmuch as the portion of the work now built is a trial section, it would be only proper to carry out the system as directed by its designer in its entirety, and give it a trial. This will be only fair to the Engineer, and its strikes us as the most prudent course for the city. If any failure ensues the responsibility can then be placed where it belongs.

If other ventilation than that provided for is found to be necessary, then the question of pipes up the fronts of the houses, *versus* man-holes as ventilators, can be considered.

Since there are "hot bloods" and privy advocates, we imagine the local Board of Health will have a rough time of it if the discretion proposed in Mr. Lamb's ordinance is left to them, and they exercise it as contemplated by those who designed the sewerage system.

We notice the following omissions which it seems proper to call attention to: The first form fails to specify the department of the city government which shall maintain and repair the sewers; the second form omits any restriction as to what shall be allowed to enter the sewers. It also omits to give the Board of Health or the Sewer Commissioners authority to call on the police or any other executive body to enforce their orders. We would also suggest that iron pipe is not connected by "wiped" joints, as contemplated in Mr. Lamb's rules.

It seems to us that the drafting of an ordinance and plumbing rules for any city should be entrusted to persons who are familiar with local circumstances and conditions, and also with the best practice in places where sewers are not a novelty.]

CHECKING WASTE OF WATER.

LOUISVILLE WATER COMPANY,
549 3D ST., LOUISVILLE, KY., *March* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Our experience here co-ordinates with that of Cincinnati in a reduction of water consumption, yet we do not credit it to practical phonetics, as an article in your issue of March 22 implies that Cincinnati does.

Our consumption for the corresponding periods was as follows:

		JANUARY.	FEBRUARY.
In 1879	Gallons,	5,479,819	4,845,638
" 1880	"	5,526,542	5,658,991
" 1881	"	9,196,188	8,010,806
" 1882	"	9,186,992	8,519,438
" 1883	"	7,467,735	7,594,744

We attribute the reduction principally to the milder winter of 1882–3 as compared with that of 1881–2 or that of 1880–1. The jump in the daily rate of consumption from 5 to 9 million gallons between 1880 and 1881–2, we attempt to explain by saying that the latter two winters were the first severely cold winters, since we commenced supplying the city under an increase of 33 feet in the head, as compared with the head under which the supply was furnished in former years.

There is not very much difference in the methods of using water, both for domestic and manufacturing purposes, between Cincinnati and Louisville; and I attach little importance to any system of inspection which stops short of the introduction of meters, no matter how you embellish it with both art and science.

Very respectfully,

CHAS. HERMANY,
Chief Engr. and Supt.

[We understand that the water authorities of Cincinnati attributed the reduction in consumption during the past couple of years, to a system of inspection and the stoppage of leaks, said inspection being facilitated by the use of a waterphone. We think the article referred to leaves no room for any other inference. Mr. Hermany does not state whether or not he makes any effort to restrict waste. It would be interesting to have information on this point, also to know the average for the other months of the two previons years.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

INDIRECT RADIATOR.

We illustrate here a novelty about to be put on the market by the A. A. Griffing Iron Company, of Jersey City, described as an "angle indirect radiator."

Figure 1 shows the heater in position, to be placed against walls; the inclination of the loops forming an angle of about 22 degrees to a horizontal line.

The loops are not set directly over each other, but staggered sufficiently so the flattened tube which forms one-half the loop, comes directly under the openings through the middle of the loop or under the space between them.

The free or outer ends of the loops form a parallel line with the wall, so that a square or rectangular coil casing may

be used without leaving a space at the ends of the loops.

In this style of heater, they are also going to use *extended surface*, one of the loops of which is shown in Figure 2, which can also be used in direct radiators if desired. The advantages sought by this arrangement being an increase of surface in the space ordinarily occupied by the Bundy radiator.

Construction Notes.

ALBANY.—The Senate Judiciary Committee have reported favorably the bill authorizing a company to construct an aqueduct from the Hudson river at Glens Falls, in Warren county, along the Hudson Valley to New York, to supply New York and cities on the way with water. Capital $50,000,000.

Digitized by Google

DOVER, DEL.—The bill authorizing Wilmington to borow $180,000 for sewerage and water supply has been mended to permit only borrowing $60,000 for purchasing vater rights. The amended bill has passed the House nd been concurred in by the Senate.

SPENCER, MASS., has had surveys made for a system of sewerage, by Mr. Healy, of Worcester. The main sewer, 18-inch pipe, is estimated to cost $12,000; street sewers, nine-inch and twelve-inch, $44,000, total cost $56,000.

DULUTH, MINN., Town Council has passed an ordinance giving to Messrs. Gray & Co., of St. Louis, privilege of furnishing gas and water.

BUFFALO,—On account of E. W. Everson, one of the contractors for the intercepting sewer, refusing to execute contract for Section C, the commission have resolved that new proposals for construction of this section shall be asked for. Bids to be opened to-morrow. Everson's bid was $109,587.

BROOKLYN.—The following bids for laying the new Eastern District water main were opened at the office of the Commissioner of City Works on the 7th inst.:

J. P. Crawford	$35,126.36
B. F. Stevens	51,226.34
Thos. McCann	43,791.00
Jas. F. Gillen	44,287.03
M. J. Dady	49,749.66
Thos. Newman	45,489.90
D. H. Valentine	54,638.60
S. L. Keeney	36,710.80
Albert Daggett	45,115.75
Freel & McNamee	42,299.54

NEW YORK.—The following bids for lighting the street and parks of the city for the year ending April 30, 1884, were opened at the Dept. of Public Works on the 6th inst. No decision by the gas commission had been made at the time of our going to press:

New York Gaslight Company, for all the city south of Grand street, $17.50 for each lamp; Manhattan Gaslight Company, for all streets between Grand and 34th streets, $17.50 per lamp; Metropolitan Gaslight Company, for all streets between 34th and 79th sts, $17.50 per lamp; Mutual Gaslight Company, for the streets between 34th and 63d streets, and for the parks between Grand and 34th streets, $17.50 per lamp; Harlem Gaslight Company, for streets between 79th street and Harlem river, including High Bridge, $19.50 per lamp; Central Gaslight Company, for the twenty-third and twenty-fourth wards, $29 per lamp; Northern Gaslight Company, for twenty-fourth ward, $32 per lamp; Yonkers Gaslight Company, for that part of the 24th ward formerly constituting the town of Kingsbridge, $30 per lamp; The Brush Electric Illuminating Company, for Union and Madison Squares, and for streets between 14th and 59th streets, and Fourth and Eighth avenues, 70 cents per night for each lamp; United States Illuminating Company, for Battery Park, City Hall Park, Washington Square, Tompkins Square, the Battery and Broadway to 12th street, Washington Square and Fifth avenue to 13th street, South street from Whitehall to Catharine streets, and West street from the Battery to West 11th street, 70 cents per night for each lamp; Brush Electric Illuminating Company, for High Bridge and its approaches, $1 a night for each lamp; the bid of the Northern Gaslight Company was declared informal. The prices are the same as now paid.

NEW YORK.—The contract for the construction of a public school house on 68th street, in the 19th ward, has been awarded to Edward Morrison, for $120 000.

The contract for 2,000 feet of hose for the fire department was awarded to the Gutta-percha and Rubber Manufacturing Company of this city for $3,750, and for a new boiler for fire engine No. 12, to the Clapp & Jones M'f'g Co, of Hudson, N. Y., for $1,300.

PHILADELPHIA.—*Gas Trust Contracts.*—The Gas Trust have awarded contracts for supplies for the works from the bids opened on March 22, as follows:

For furnishing pig lead and pig tin, to Tatham Bros., at 4.69½ per cwt. for lead and 21¾ cts. per lb. for tin; for ead pipe, to N. & G. Taylor Co., at 6 cts. per lb.

For furnishing 500 street lamps, to Joseph Newman, at 3.65 per lamp.

BOSTON.—The annual report of the city Engineer, ows that the average daily consumption of water from e Sudbury and Cochituate Works was 31,970,800 gallns; from the Mystic Works, 6,574,400 gallons. The nsumption from the Sudbury and Cochituate Works ows an increase of about three per cent. over that of the year 1881, while that of the Mystic Works shows a decrease of about 85 per cent. About one half of this decrease was due to a reduction in the amount furnished from those works for the supply of East Boston. The total consumption shows an increase of 330,300 gallons per day, or about one per cent. over that of 1881. The daily average consumption per head of population has been 91 gallons from the Sudbury and Cochituate Works, 77 gallons from the Mystic Works, and 88 gallons from the combined supplies. From the high service works, the daily average was 2,786,545 gallons, an increase of 15.7 per cent. over that of 1881. The cost of construction of Basin 4, to January 1, 1883, including the cost of plant on hand, is $162,469.35. The cost of removal of loam, including cost of steam-excavator, and of grading 2,900 of track, is $10,963 92. The intercepting system of sewerage is at present in condition for use up to and including the point where the sewer is raised high enough to be discharged into the outer harbor, and that beyond this point it can probably be put into condition for use within a year. Extension and perfection of the system may continue for a year or two longer. The work, as a whole, and in its parts, is known to be durable and efficient, and no doubts are entertained that it will accomplish the good results which have been claimed for it. The total appropriation for improved sewerage is $5,253,000. The gross expenditure to January 1, 1883, including that for preliminary surveys, has been $3,389,104.07, leaving a balance of $1,863,895.93.

CHICAGO.—The contract for street cleaning was awarded, April 3, to Chas. Walsh & Son, at $34.90 a mile, the number of miles to be cleaned this year being 2,500. Walsh's bond is $120,000. John Garrick, a lower bidder, refused a contract.

The new Bridgeport lock was put in operation April 2, and canal navigation opened.

The Southington, Conn., Water Company is investigating the best sources and mode of supply for that town, with the aid of their engineer, Mr. T. H. McKenzie, and Mr. J. J. R. Croes as consulting engineer.

The New Orleans, La., Water Works Company has sued the city for damages for having granted permission to an ice company to convey river water to its premises some distance from the river. The water company claims that their contract with the city excludes all persons, except riparian occupants, from taking river water for private uses.

The city of Nashville, Tenn., has a chronic difficulty with its water works machinery. The first pumping engines, put in a few years ago, were only persuaded to work after a good deal of coaxing and some material alterations. During last summer proposals were invited for additional engines, and the contract was awarded. An unsuccessful bidder and his friends are now convinced that the selection of machinery was influenced by corrupt considerations, and a committee is investigating the subject. Nothing but vague rumors have been adduced so far to sustain the charge that one of the most successful and reputable civil engineers of the country, and one of the largest manufacturing companies in the United States had combined to debauch the officials of this Tenneesee town. The presumption is certainly against the probability of any such dirty work by gentlemen of heretofore unquestioned high character and of excellent reputation.

Preparations are making to extend still further east on Long Island the conduit which supplies water to Brooklyn. Mr. Robert Van Buren, the chief engineer, thinks that by going ten miles a sufficient supply can be intercepted to bring the total quantity of water furnished the city up to sixty million of gallons daily. The works proposed will require two years or more for their construction. By the time they are finished the capacity of the present works will be nearly equalled by the consumption and waste water.

GOVERNMENT WORK

Synopsis of bids, opened March 26, for marble and granite for Washington monument. Marble: H. Sisson, Baltimore, $1.50; Lee Marble Co., New York, $1.29. Granite: Gill & McMahon, Baltimore, 75 cts.; Cape Ann Granite Co., Boston, 56 cts.; Bodwell Granite Co., Rockland, Me., 65 cts.; William S. White, Rockland, Me., 51 cts.; Mt. Waldo Granite Works, Frankfort, 59 cts.; Henry S. Taft, Providence, R. I., 75 cts.

Synopsis of bids opened March 31, 1883, for encaustic floor tiling, for the Custom House and Post Office at St. Louis:

Henry Dibble	$14,300
	11,696
	10,696

Wallace ...502 Lehigh ave, three stores and dwel; b, Jacob Ebner Poplar and 27th st, seven dwel; o, Jacob Fleming....780, 2, 4 S. Sixth st, three dwel: b, N. H. Atkinson....1227–29 Filbert st, hotel build; b, Jos. M. Wells... 2234–36 Warnock st, two dwel; b, W. Schoenlober.... 1931 Bainbridge st, dwel; o, Jessie Wellf....Somerset, w of 6th st, dwel; b, John J. Baldt & Son ...Percy n of Poplar st, dwel; o, George F. Payne & Co....11th, n of McKean st, eleven dwel; o, Blaney Harvey....610 Locust st, factory, b, Geo W. Payne & Co ...2d st, n of Trenton av, factory; b, Atwater ...Emerald, e of Venan, four dwel; b, G. Gillback....Cadwalader. w of Montgomery st, add to factory; o, J. B. Stetson....21st, s of Reed st, four dwel; b, W. Forbes....Christian, w of Broad st, dwel; b, Thompson & Bros....N E cor 6th and Oregon, five dwel; o, R. Dawscieson....132 N Front st, four warehouses; o, Thos. Little ....Barlow, nr Wharton st, four dwel; o, A. M. Greene....6th, nr Wharton, five dwel; o. A. M. Greene . .Orthodox, w of Seiper st, dwel; b, Wilson Milnor.

READING, PA.—S and Elm st, br dwel; cost, $6,000; o, L. Repplier... 4th and Washingion sts, br dwel; cost, $9,000; o, T. Wilson....5th st, br school house; cost, $12,000; o, Presbyterian Congregation... 4th and Court st, engine house; cost, $7,250; o, City of Reading; a, Wm. A. Fink; b, H. & D. C. Kutz.

RIVERSIDE, ILL.—Fr dwel, cost some $10,000; o, E. C. Waller; a, Burnham & Root; b, not let....St and fr church, cost $10,000; o, St. Paul's Episcopal Parish; a. L. W B. Jenney; b. not let.

SALT LAKE CITY.—Main st, br hotel; cost, $10,000; o, Walker Bros.; a, Wm. Paul; b, Savil & Baker.

WASHINGTON, D. C.—7th st, bet 2d and R. I. ave, br dwel and cellar; cost, $5,000; o, J. Gockeler; b, Beha....14th st, between W and R. I. ave, br dwel and cellar; cost, $5,400; o and b, J. A. Jones... 14th st, extended Mt. Pleasant, st and br dwel; cost, $8,0 0; o, Gen. D. G. Swayne; a, Bright & Humphries... H. bet 9th and 10th sts, 3 br dwels; cost, $15,000; o, C. C. Duncanson; b, D. McCarty.

WHEELING, W. VA. –18th st, additions and alternations City Gas Works; cost, $10,000; o, City Dry Works. . 14th st, br residence; cost, $7,000; o, J. Fewer; a, Hamilton....14th st, two br dwells; cost, $12,000; o, J. Bodley.

MISCELLANEOUS.

BOSTON, MASS.—$630,000 has been vot ed by the aldermen for a new building for the public library.

BROOKLYN, N. Y.—A bank building is to be erected at the corner of Remsen st. and Court Square. The following architects have competed for the plans. Messrs. LeBrun & Son, H. R. Marshall, E. L. Roberts and Parfitt Bros.

BUFFALO, N. Y.—The corner-stone of the great Sängerfest Music Hall, has been laid. The building is to cost $160,000, and will seat 5,500 persons.

CANTON, N. Y.—Contract let for new br school house to Breath Wait & Kelly at $17,500.

CHICAGO, ILL.—Mr. George M. Pullman's architect is making designs for a new nine story office building. To be of brick with stone corner caps and sills, to be erected on the corner of Michigan av and Adam st. The cost is not yet decided. Negotiations are pending for the erection of a new depot on Forty-third street, this season....Albert Smith has made plans for the improvement of St. Andrew's Episcopal Church. The cost will be $6,000. Architects Treat & Foltz have plans for a building in the North Division to cost $100,000, to be built of pressed brick and brown stone. They will also build a dwelling on Michigan av, nr 26th st, of pressed brick and brown stone, to cost $40,000. The plans for St. Luke's Hospital, at Indiana av, nr 14th st, were made by Treat & Foltz. It will be from two to four stories high, have four pavilions and cost $125,000.

CLEVELAND, O.—Plans have been submitted by Mr. Levi T. Scofield to the County Commissioners for the court house. They were put over until the following meeting of the commissioners, and it is said are likely to be adopted.

EATON, O.—The town has voted in favor of a $30,000 schoolhouse.

FAIR HAVEN, N. J.—Rev. W. O. Embury, the rector of St. George's Church, Fair Haven, has undertaken the work of erecting an edifice to be known as the "Chapel of the Holy Communion." It will be a Gothic structure, of brick. with slate roof. The cost will be $8,000.

HALLOWELL, ME.—An Industrial School building for girls, to cos $10,000, is to be erected if the money can be raised.

HAMLINE, MINN.—Architect Hayes has drawings for a building t replace the Hambine University, recently destroyed by fire. It is to be commenced immediately.

HAVERHILL, MASS.—Charles F. Cate, mason, and Lewis Killam, carpenter, have the contract for the new Academy of Music, to be located on the site of the old Baptist Church, Merrimac Street. The building will be of brick and granite, and cost $150,000.

HYDE PARK, ILL.—H. J. Furber a wealthy resident of Henwood, will build about seventy-five dwelling houses of superior style, on the lake shore, near the Forty-third street station on the Illinois Central line. To cost from $5;000 to $7,000.

LURAY, VA.—Architect W. F. Weber has plans for a frame addition to the Lutheran Church, the front to be 38 feet wide; it will have a tower 60 feet high. The cost will be $16,000.

MONROE, WIS.—G. P. Randall is the architect of a schoolhouse which is to be built, costing $17,000.

MONTREAL.—The Municipal Council of Longueuil passed a by-law subscribing $25,000 to the Hope Cotton Company building to be erected at Longueuil

NASHVILLE, TENN.—March 26th. A building permit was issued to J. George Harris, for three frame residences on Joseph av. bet. Berry and Foster sts, to cost $2,100. Mr. J. W. Thomas has a permit to erect a two-story brick residence on Lindley avenue, near Maple street to cost $5,500. During the month of March building permits to the amount of $50,000 were issued.

NEW HAVEN, CONN.—Mr. A. E. Kent, of San Francisco, has given Yale College $60,000, with which a chemical laboratory will be erected.

NEW YORK.—Messrs. Robert and Ogden Goelet are about to erect an eight-story building on the northeast corner of Broadway and Nineteenth street. The building will cost $180,000; Edward H. Hendall is the architect; materials brick and Belleville blue stone, with the interior fire proof.

NIAGARA FALLS.—Tenders for building the post office and custo house at Clifton were withdrawn by the government, as too elaborate. The lowest tender was $32,000 and the highest $40,000. The government architect was instructed to draw new plans and call for tenders not to exceed $20,000, which will be done at once.

OHIO.—A bill has been reported from the Committee on Insane Asylums appropriating $600,000 for buildings at Athens, Cleveland and Dayton, and for purchasing land and erecting buildings in the northwestern part of the State The General Assembly have passed a bill appropriating $25,000 for Ohio State University. The money will be expended in the erection of a building for the department of Botany and Horticulture.

PORTLAND, ME.—The Casco-Street Society is soon to build a church on New High st.

RICHMOND, MASS.—John Flansburg has taken the contract to build a the new Congregational Church for $7,000.

ROCHESTER, N. Y.—James Wilson & Co. are about to erect a building on South Water st., to be of brick with Ohio stone trimmings. The dimensions are 75 feet on Water st, and 100 feet deep. Seven stories high on river, six on Water st. Mr. F. Tulley is going to build a new block on Exchange, st to extend back 140 feet to Aqueduct st. Messrs. Putnam & Block are the architects.

SPRINGFIELD, MASS.—Three plans have been submitted for the building of a two-story depot on Lyman street.

UTICA, N.Y.—Mar. 29th. Ground is broken for a new church building, cor. South st. and Taylor ave. It will be built of br, and cost $29,000; a, Thomas Birt. The owners are the members of St. Mary's Parish, under care of Rev. Father Fehling, priest.

WILMINGTON, DEL.—James Parker, is about to erect a fine house at Seventh and Broom streets.

DENVER, COL.—At an election held under the new charter of the city, Mr. H. C. Lowrie, was re-elected City Engineer for a term of two years, by 2,451 plurality over Leonard Cutshaw and Joseph R. Brinker. Mr. Lowrie ran 642 votes ahead of his ticket, with ex-Gov. Jno. L. Routt at the head for Mayor.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

267,734. FAUCET. CHARLES WHITTAKER, Chicago, Ill. Filed June 12, 1882. (No model.) Issued Nov. 21, 1882.

Claim.—1. In a hot and cold water faucet, the combination, in a single water chamber, of two valves with a single crank pin adapted by the peculiar relative arrangement of said valves to said crank pin to be both simultaneously and alternately opened and closed by the rotation of said pin, substantially as and for the purpose specified.

2. The combination of chamber D, provided with ports F and G, stoppers H and I, rods L and M, crank pin K valve stem C, and handle A, substantially as set forth.

267,786. WATER CLOSET. MATTHEW HOGAN, Hartford, Ct. Filed March 19, 1882. (No model.) Issued Nov. 21, 1882.

Claim.—1. In a water closet, in combination, a plunger chamber and a tank having a communicating outlet whereby the water is drawn out of the tank when the plunger is raised, and inlet by means of which water is not returned to the tank until after the bowl and plunger chamber have become refilled, all substantially as described.

2. In a water closet, in combination, bowl *a*, plunger chamber *f*, tank *e*, partition *k*, with valve *m*, and overflow, all substantially as described.

3. In a water closet, in combination, bowl *a*, plunger chamber *f*, plunger d^1, partition *k*, valve *m*, overflow tank *e*, cock *o*, and operating mechanism, all substantially as described.

4. In a water closet, in combination, bowl *a*, pan *c*, casting *d* and trap *g*, all substantially as described.

5. In a water closet, in combination, bowl *a*, pan *c*, casting *d*, trap *g*, and waste pipe g^2, all substantially as described.

6. In combination, in a plunger, a handle, f^2 case e^2, having overflow inlet g^2, and outlet passages $i^2 j^2$, interior valve, h^2, exterior groove k^2, and a packing ring l^2, all substantially as described and for the purpose set forth.

268,120. CESSPOOL. LOUIS MOURAS, Vesoul, France. Filed Apr. 5, 1882. (No model.) Patented in France Sept. 22, 1881, No. 144,904; in Russia Dec. 8, 1881; in England Dec. 9, 1881, No. 5,391; in Belgium Dec. 10, 1881, No. 56,454; in Germany Dec. 10, 1881, No. 18,641; in Austria Dec. 13, 1881, No. 41,450; in Italy Dec. 18, 1881, and in Spain Dec. 26, 1881, No. 2,365. Issued Nov. 28, 1882.

Claim.—1. The combination, with the hermetically-closed cesspool, of the inlet-pipe, the tray to receive the insoluble deposits, suspended below the inlet by links, the said links and the chain to raise the tray to the discharge-opening, all arranged substantially as set forth.

2. The combination, with the deep hermetically-closed cesspool provided with a sealed inlet-pipe, a hermetically-closed discharge-opening in its cover, and a sealed outlet near its top, of the tray M, suspended below the inlet and provided with means, substantially as shown, for swinging it up to the discharge-opening in the cover of the pool, as set forth.

3. The combination, with the hermetically closed cesspool provided with a suitable inlet, of the U-shaped discharge-passage J, the covering-flags G, having an aperture for the inspection of passage J, and the sealed plug I, to close said aperture, all arranged substantially as set forth.

268,209. URINAL. ROBERT E. DAY, Hartford, Conn., assignor to the Hartford Sanitary Plumbing Company, same place. Filed Aug. 10, 1882. (No model.) Issued Nov. 28, 1882.

Claim.—1. A urinal or slop-basin constructed with a vertical extension, C, from the bottom of the basin, and with a vertical extension, E, at the top, the two extensions substantially concentric the one with the other, and in a line vertically through the basin, combined with brackets D and F, respectively, holding the lower and upper extensions from the basin, substantially as described.

2. In a urinal or slop-basin, the trap for the discharge-opening, consisting of the concavo-convex disk, constructed with the perforated hollow projection extending up into the basin from said disk, substantially as described.

3. A urinal or slop-basin constructed with an extension, C, at the bottom and with a neck, E, above, combined with brackets D and F, each holding its respective end of the basin, combined with a chimney, H, covering the opening in the neck, substantially as and for the purpose described.

268,379. URINAL. E. FRANCIS BALDWIN, Baltimore, Md., assignor to Andrew G. Myers, New York, N. Y. Filed March 27, 1882. (No model.) Issued Dec. 5, 1882.

Claim—1.—A urinal having the edge of its bowl provided with an overhanging flange, A, substantially as and for the purpose set forth.

2. A urinal having the edge of its bowl provided with an overhanging flang, A, integral with the bowl, substantially as and for the purpose set forth.

268,387. PISTON WATER METER. HENRY CHANDLER, Buffalo, N. Y Filed Aug. 24, 1881. (No model.) Issued Dec. 5, 1882.

Claim.—1. The combination, with a cylinder, A, provided with an induction port, *a*, and two eduction ports, *b* b^1, on opposite sides of the centre line of the induction port, of a hollow piston, and a divided or double hollow valve arranged within the piston, whereby the liquid is alternately directed into opposite ends of the cylinder and alternately discharged from the eduction ports, substantially as set forth.

2. The combination, with a cylinder, A, provided with an induction port, *a*, and eduction ports, *b* b^1, of a piston provided with rings C C^1 and heads D D^1, and a divided or double valve, E, having ports *g* g^1 and open ends F F^1, substantially as set forth.

3. The combination, with a cylinder, A, provided with an induction port, *a*, and two eduction ports, *b* b^1, of a hollow piston, C C^1 D D^1, and a divided or double valve, E, sliding in the piston and provided with tubular ends F F^1, seated against the heads of the hollow piston, substantially as set forth.

4. The combination, with a cylinder, A, provided with an induction port, *a*, and two eduction ports, *b* b^1, of a piston provided with rings, C C^1, and heads D D^1, a valve, E, provided with a central partition, *e*, ports *g* g^1, and tubular ends F F^1, the latter projecting through openings in the heads D D^1 and provided with collars *k* k^1, substantially as set forth.

5. The combination, with the cylinder A, and a piston connected at its ends with annular heads D D^1, of recesses *k* k^1, formed at both ends of the cylinder and made wider and deeper than the annual heads D D^1, whereby when one of said heads projects into one of the recesses *k* k^1, at the end of the stroke, a communication is established around the head between the spaces on the front and rear sides thereof, substantially as set forth.

6. The combination, with a cylinder having an induction port, *a*, and a piston provided with rings C C^1, of a divided or double valve, E, provided with ports *g* g^1 on opposite sides of its partition, the ports being adapted to be opened on one side before they are entirely closed on the other side, substantially as set forth.

7. The combination, with a cylinder, A. provided with an induction port, *a*, and eduction ports, *b* b^1, of a piston provided with rings C C^1 and dished heads D D^1, all connected by bars, *c*, and a divided or double valve, E, composed of an enlarged middle portion sliding in the rings C C^1, and provided with ports, *g* g^1, and contracted tubular end portions F F^1, sliding in the heads D D^1, substantially as set forth.

8. The combination, with a cylinder, A, provided with an induction port, *a*, and eduction ports, *b* b^1, of a hollow piston, C C^1 D D^1, and a hollow divided or double valve, E, arranged to slide in said piston and adapted to have its movement arrested before the piston closes the eduction ports, substantially as set forth.

268,502. WASH STAND. NAPOLEON LE BLANC, Kansas City, Mo. Filed July 10, 1882. (No model.) Issued Dec. 5, 1882.

Claim.—1. The combination, with a hinged bracket or crane, having curved arm B, of a wash bowl or basin mounted in a ring hinged to said curved arm, as set forth.

2. The combination of the hinged bracket or crane, the wash bowl or basin mounted in a holder hinged to the curved arm B of said crane, and flexible pipes connecting said wash bowl with a suitable water supply and waste pipe, as set forth.

3. The combination and arrangement, as described, of the crane or bracket A, having curved arm B, the hinged ring or holder C, the bowl or basin D, having faucets E, and the flexible pipes F G, as and for the purpose set forth.

268,555. URINAL. C. PERRIN SIMPSON, New York, N. Y Filed Sept. 7, 1882. (No model.) Issued Dec. 5, 1882.

Claim.—The mouth piece, tubing, and cover, substantially as described, combined together for the purpose herein set forth.

267,746. STEAM TRAP. JEROME B. FULLER, and DWIGHT P. MILLS, Naugatuck, Conn. Filed Aug. 31, 1882. (Model.) Issued Nov. 21, 1882.

267,554. COMMODE. FRITZ MINK, Philadelphia, Pa. Filed May 6, 1882. (No model.) Issued Nov. 21, 1882.

267,760. REVOLVING TABLE FOR TILE MILLS. JOHN S. SMITH, Jackson, Mich. Filed July 27, 1882. (No model.) Issued Nov. 21, 1882,

267,761. STEAM GENERATOR. JAS. C. STEAD, Brooklyn, N.Y. Filed April 27, 1882. (No model.) Issued Nov. 21, 1882.

267,762. STEAM GENERATOR. JAS. C. STEAD, Brooklyn, N. Y. Filed Mar. 17, 1882. (No model.) Issued Nov. 21, 1882.

267,769. MAGAZINE DRUM STOVE. GEO. H. BARBOUR, and MERRILL B. MILLS, Detroit, Mich., assignors to the Michigan Stove Co., same place. Filed Apr. 4, 1882. (No model.) Issued Nov. 21, 1882.

267,780. WATER GAGE AND ALARM. PATRICK V. DWYER, Gloversville, N. Y. Filed Sept. 5, 1882. (No model.) Issued Nov. 21, 1882.

267,787. WATER COCK. MATTHEW HOGAN, Hartford, Conn. Filed June 10, 1882. (No model.) Issued Nov. 21, 1882.

268,157. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa., Filed Sept. 14, 1882. (No model.) Issued Nov. 28, 1882.

268,158. LEAD-ARMORED ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 23, 1882. (No model.) Issued Nov. 28, 1882.

268,159. UNITING AND BRANCHING ELECTRIC CABLES. RICHARD S. WARING, Pittsburg, Pa., Filed Sept. 21, 1882. (No model). Issued Nov. 28, 1882.

268,175. APPARATUS FOR CHARGING ELECTRIC STORAGE-BATTERIES. VIRGIL W. BLANCHARD, New York, N. Y. Filed July 24, 1882. (No model.) Issued Nov. 28, 1882.

268,176. HYDROCARBON-FURNACE, VIRGIL W. BLANCHARD, New York, N. Y., Filed Dec. 16, 1881. (No model.) Issued Nov. 28, 1882.

268,183. VENTILATOR. PEYTON CASSNER, Gould, Kan. Filed Apr. 4, 1882. (No model.) Issued Nov. 28, 1882.

268,251. WET GAS-METER. WILLIAM MACKINTOSH, Callao, Peru, South America. Filed July 22, 1882. (No model.) Issued Nov. 28, 1882.

268,256. FIRE-GRATE. GEORGE C. MAXWELL, Allenport, Pa. Filed Sept. 15, 1882. (No model.) Issued Nov. 28, 1882.

268,304. ECCENTRIC-SHAPED FILTER. LYMAN SMITH, Kansas City, Mo., Filed Nov 4, 1882. (No model.) Issued Nov. 28, 1882.

268,308. SECONDARY BATTERY. ELI T. STARR and E. EUGENE STARR, Philadelphia, Pa., assignors of one-half to William J. Peyton. Washington, D. C. Filed Oct. 6, 1882. (No model.) Issued Nov. 28, 1882.

268,331. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Compaay, New York, N. Y. Filed Aug. 31, 1882. (No model.) Issued Nov. 28, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an urban population of 6,904,191, there died, during the week ending March 24, 3,272 persons, which is equivalent to an annual death rate of 24.6 per 1,000, an increase on that of the preceding week, which was 23.4 per 1,000.

For the North Atlantic cities the death rate was 20.7; for the Eastern cities 26.1; for the lake cities 21.2; for the river cities 20.4, and in the Southern cities, for whites, 28.1; and for the colored 41.1 per 1,000.

The death rate continues especially high in New York city (29.1), in Wilmington (27.6), in Memphis (white 38.5, colored, 48.4), and in New Orleans (white 32.8, colored 65.1). It is also very high in Newark (34.9), in Buffalo (36.9) and in the District of Columbia (white 28.0, colored 38.0).

Consumption caused 14.9 per cent. of all the deaths. In the North Atlantic cities it caused 19.7, in the Eastern cities, 14.8, in the lake cities, 13.4; in the river cities 14.8, and in the Southern cities, 14.8 among the whites and 11.9 among the colored. Diphtheria caused 2.9 per cent. of all deaths. In the North Atlantic cities it caused 2.3; in Eastern cities 2.9; in lake cities 5.1; in the river cities 2.3; and in the Southern cities 1.2 among the whites, and .5 among the colored.

Typhoid fever caused 1.3 per cent. of all deaths. In the North Atlantic cities it caused 1.0; in Eastern cities, 1.8; in the lake cities, .5; in the river cities, 2.6; and in the Southern cities, among the whites, .4, and no deaths among the colored population. The greatest mortality from this disease occurred in Philadelphia, where it caused over 4 per cent. of all deaths.

Malarial fevers caused 1.2 per cent. of all deaths. The highest proportion occurring among the white inhabitants of Southern cities, where it was 2.9 per cent.

Scarlet fever caused 2.6 per cent. of all deaths. In the North Atlantic cities it caused 1.3; in the Eastern cities 3.6; in the lake cities 2.5; and in the river cities 3.3

Pneumonia caused 12.0 per cent. and bronchitis and congestion of of the lungs 5.2 per cent. of all deaths. In the North Atlantic cities

pneumonia caused 12.0 per cent. of all deaths, in the Eastern cities 15.1; in the lake cities 7.1, in the river cities 3.7, and in the Southern cities 11.8 per cent. among the whites and 9.5 among the colored.

It will be found interesting to compare the percentages with those given in the SANITARY ENGINEER for the two preceding weeks. Small-pox caused 2.4 per cent. of all deaths, but 67 out of the total of 76 deaths occurred in New Orleans alone.

Of an urban population of 6,886,952 there died during the week ending March 31, 3,082 persons, which is equivalent to an annual death rate of 23.2 per 1,000.

For the North Atlantic cities the death rate was 22.7; for the Eastern cities 25.7; for the lake cities 18.4; for the river cities 20.8; and in the Southern cities, for whites 19.5 and for the colored 35.5 per 1,000.

Consumption caused 15.9 per cent of all deaths. In the North Atlantic cities it caused 18.9; in the Eastern cities 16.1; in the lake cities 12.4; in the river cities 17.1; and in the Southern cities for the whites 12.6 and for the colored 16.9 per cent.

Diphtheria caused 3.0 per cent of all deaths. In the North Atlantic cities it caused 2.4; in the Eastern cities 2.3; in the lake cities 6.2; in the river cities 3.3; and in the Southern cities, for the whites 2.9 per cent.

Typhoid fever caused 1.9 per eent of all deaths. In the North Atlantic cities it caused 2.7, in the Eastern cities 2.0; in the lake cities 1.4; in the river cities 2.1; and among the Southern colored 1.6 per cent.

Scarlet fever caused 3.4 per cent of all deaths. In the North Atlantic cities it caused 1.8; in the Eastern cities 3.7; and in the lake, river, and Southern cities (whites) 3.8 per cent.

Pneumonia caused 13.4 per cent of all deaths. In the North Atlantic cities it caused 15.5; in the Eastern cities 13.4; in the lake cities 8.7; in the river cities 14.7; in the Southern cities for whites 12.6 and for colored 21.7 per cent. The death rate coutinues high in New York City (29.1; per 1,000.)

LYNCHBURG, VA.—Dr. Thos. L. Walker reports March 31 the disappearance of small-pox from the city.

PATERSON N. J.—Dr. W. K. Newton reports that 19 cases of scarlet fever were officially noted during the month of March.

BOSTON, MASS.—C. E. Davis, Jr. reports 23 cases of diphtheria, 21 of scarlet fever and five of typhoid fever.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 29 new cases of scarlet fever and five of diphtheria, making 50 of the former disease under treatment and ten of the latter.

PROVIDENCE, R. I.—Dr. E. M. Snow notes a considerable increase of typhoid fever in the last ten or fifteen days, 40 new cases having been reported. "This increase of typhoid fever, at this season, is very unusual, it being especially a disease of the autumn. Though it is evident that there must be some general cause for the fever, probably atmospheric, yet it is a well established fact, that in a large majoritv of the cases, there is some local cause within the house or premises, which can be discovered, and which might be removed and without which the case of fever would not be produced."

Digitized by Google

DETROIT, MICH.—Dr. O. W. Wight reports 12 cases of diphtheria and 14 of scarlet fever.

PITTSBURG, PA.—Dr. Snively states that no new cases of small-pox were reported during the week.

NEW YORK CITY LUNATIC ASYLUM.—Dr. T. M. Franklin reports 1,340 insane patients remainding under treatment March 31. The changes during the week were six admitted, two discharged and five died.

MOLINE, ILL.—Dr. L. D. Dunn report March 31, that there is no small-pox in Moline. A case was reported recently, but there proved to be a mistake in the diagnosis.

PEABODY, MASS.—Dr. C. C. Pike, reports the prevalence of measles of a severe type.

BALTIMORE, MD.—There were 182 deaths in Baltimore, during the week which ended March 31 ; Males 92, females 90 ; under five years 69, over 60 years 25. The annual rates per 1,000 calculated on the mortality of the week, and on the population as estimated by the local authorities (white 348,900, colored 59,620) were for the whole population 23.14, for the white 19.96, for the colored 41.60. Small-pox caused only four deaths during the week. Twenty-two deaths are reported as occasioned by consumption, five by croup, seven by diphtheria, one by typhoid fever, 10 by scarlet fever, 12 by pneumonia, one by bronchitis, two by pleurisy, one by measles, one by puerperal fever, two by whooping cough and five by violence.

CAMDEN, N. J.—Dr. H. F. Palm's report for the week ending March 24, was not received in time for entry in our table. Deaths from all causes 24 ; deaths under five years five ; deaths caused by consumption six, by malarial fever one, by pneumonia one, and by bronchitis two.

NEW YORK CITY.—The reports of the Health Department, for the quarter ending Dec. 31, 1882, shows a total mortality of 7,669 as against 8,068 and 9,022 in the corresponding periods of 1880 and 1881. The deaths of children under five years numbered 2,763. Violence caused 327 deaths, small-pox, one, measles 57, scarlet fever 107, diphtheria 278, croup 170, whooping cough 98, typhus two, typhoid fever 133, puerperal diseases 67, diarrhœal diseases 408, consumption 1,308, bronchitis 365, pneumonia 775.

During the year 1882, 37,924 deaths occurred in the city of New York, giving a rate of 29.64 per 1,000 of its population of 1,279,560 as estimated to July 1, 1882. Violence caused 1,376 deaths, small-pox, 259, measles 913, scarlet fever 2,066, diphtheria 1,525, croup 729, whooping cough 658, erysipelas 149, typhus 65, typhoid fever 362, cerebrospinal fever 238, puerperal diseases 407, malarial fevers 540, diarrhœal diseases 4,050, consumption 5,251, bronchitis 1,583, and pneumonia 3,472.

CALIFORNIA.—The monthly circular of the State Board of Health for February gives an abstract of the deaths and their causes in 17 towns aggregating a population of 110,282. The total mortality was 141. Sixteen of the deaths were caused by consumption, 19 by pneumonia, five by bronchitis, eight by diphtheria, four by croup, two by scarlet fever, two by malarial fevers, eight by typhoid fever, one by cerebrospinal fever, and one by erysipelas. The annual rate per 1,000 was for the State 15.24, for the coast cities 12.60, (San Francisco, San José, Santa Barbara and other cities failed to make returns), for the Coast Valleys 13.80, for the interior valleys 20.78, and for the mountains 4.22. Six of the diphtheria cases were reported from Sacramento. Since last report a single case, so far as learned, of small-pox appeared in Napa, supposed to have been caused by handling hides from Arizonia where the disease has prevailed. Recently it has appeared in Nevada City, its origin not yet being known to the Board of Health.

ONTARIO, CANADA.—The prevailing diseases of the week ending March 24, were influenza, bronchitis, measles, neuralgia, anæmia and intermittent fever. Measles increased very considerably in degree and area of prevalence during the week. It constitutes 8.2 per cent. of the total diseases reported, while during the two weeks preceding it formed 5.15 and 6.6 per cent. of the respective totals.

CITY OF MEXICO, MEXICO.—There were 184 deaths during the week which ended Feb. 25; under five years 92, over 70 years five. Consumption caused 12 of the deaths, pneumonia and bronchitis 39, diarrhœal diseases 26. No deaths occurred from measles, scarlet fever, erysipelas or puerperal fever. Small-pox caused one death, croup and diphtheria two, whooping cough three and typhoid fever six.

RIO DE JANEIRO, BRAZIL.—Consul General C. C. Andrews reports the appearance and increase of yellow fever since the advent of warm weather. During the four weeks ending respectively on Feb. 3, 10, 17 and 24, the deaths numbered five, four, five and 14. The deaths from small-pox during these weeks numbered 26, 19, 12 and 22.

ENGLAND.—The return of the Registrar-General for the week ending Mar. 17, has been received. The annual rate of mortality averaged in the 28 large towns 26.0 per 1,000 of their aggregate population. Portsmouth registered the lowest rate, viz., 18.7, and Preston the highest, viz., 37.1. Whooping cough caused 13 deaths in Hull. Small-pox caused one death in London, three in Newcastle-on-Tyne, two in Birmingham and one in Hull.

London.—Births, 2,771; deaths, 1,854. The former are 62 below, and the latter 74 above the average numbers in the corresponding weeks of the last ten years. The annual rate which had been equal to 20.5, 21.0 and 21.7 in the three preceding weeks rose to 24.5. During the first 11 weeks of the current quarter, however, the rate averaged only 21.3 against 27.2, 23.0 and 26.0, in the corresponding periods of the three years 1880-82. The deaths included one from small-pox, 51 from measles, 20 from scarlet fever, 18 from diphtheria, 33 from whooping cough, and 20 from typhoid fever. The deaths referred to diseases of the respiratory organs rose to 548 or 62 above the corrected weekly average; 349 were attributed to bronchitis and 115 to pneumonia. Different forms of violence caused 57 deaths.

SCOTLAND.—In the eight principal towns the death rate for the week ending March 17, averaged 28.8 per 1,000. The lowest mortality was recorded in Greenock 16.7 and the highest in Dundee 34.8. A slight increase is observed in the mortality from zymotic diseases. Whooping cough continues to be the most fatal miasmatic disease.

Edinburgh.—Total mortality 104; rate 22.9. No death is reported from small-pox or scarlet fever. Measles caused one death, diphtheria three, whooping cough six, fever three, diarrhœal diseases two, acute diseases of the lungs 28 and violence two.

IRELAND.—Consul A. B. Wood transmits the return of the Registrar-General for the week ending Mar. 17, a summary of which is embraced in our weekly table. The report for the week ending Mar. 10 has failed to come to hand.

Belfast.—Mortality 135; rate 32.8. No death occurred from small-pox, typhus or diphtheria. Measles caused one death, scarlet fever seven, whooping cough nine, typhoid fever one, diarrhœal diseases four, consumption 13, diseases of the respiratory system 47, and violence one.

Dublin.—Mortality 229; rate 34.1. No deaths occurred from small-pox, measles, scarlet fever, or diphtheria. Typhus caused two deaths, typhoid fever three, diarrhœal diseases three, whooping cough 14, consumption 32, acute lung diseases 58 and violence five.

During the five weeks which ended Feb. 3, there were 1,023 deaths in the Metropolitan registration area, equal to an annul rate of 30.42 per 1,000. The births during the period numbered 1,025 or 30.5 per 1,000. No death was registered as caused by measles, small-pox or diphtheria. The only zymotic disease which attained to serious proportions was whooping cough, to which 42 deaths were attributed. Scarlet fever caused one death, typhus fever ten, typhoid fever six and diarrhœa and dysentery ten.

PARIS, FRANCE.—During the week ending March 14, 1,209 deaths were recorded ; males 689, females 520 ; under five years 343, over 60 years, 266. Typhoid fever caused 30 deaths, small-pox 13, measles 18, scarlet fever two, whooping cough 13, croup and diphtheria 38, dysentery one, erysipelas six, puerperal fever five, consumption 238, bronchitis 53. pneumonia 91, and violence 30. Annual rate 28.05.

On March 11 there remained under treatment in the hospitals 99 cases of small-pox, 202 of typhoid fever and 52 of diphtheria.

RHEIMS, FRANCE—Consul John L. Frisbie reports for the week ending March 10: Deaths 65, births 57. Annual mortality rate, 36.02 ; deaths in persons under five years 29, over 60 years 18. Whooping cough caused one death, croup and diphtheria two, typhoid fever one, bronchitis and pneumonia 11, consumption eight, diarrhœa one, and violence one. No death is reported from small-pox, measles, scarlet fever, erysipelas or puerperal fever.

MARSEILLES, FRANCE.—The *Bulletin* for February records 912 deaths in a population of 360,099 ; males 521, females 391 ; under five years 286, over 60 years 241. The births during the month numbered 897. A decrease is reported in the number of deaths from contagious or transmissible diseases: thus, small-pox, which caused 26 deaths in December, and 19 in January, was the occasion of only 16 in February ; measles caused 18 deaths as compared with 31 and 22 in December and January ; typhoid fever 32 as compared with 47 and 39 in the preceding months, and croup 23 as against 40 and 38. Whooping cough and scarlet fever caused one death each, consumption 92, bronchitis 51, pleurisy five, pneumonia 171, pulmonary congestion eight, dysentery three, diarrhœa and enteritis 46, puerperal fever two, and violence 26.

BRUSSELS, BELGIUM.—In the city and its *faubourgs* there occurred 290 births and 215 deaths during the week ending March 10. Of the deaths 94 were of children under five years of age. Small-pox caused three deaths, measles five, scarlet fever, typhoid fever and diphtheria one each, croup three, whooping cough two, diarrhœal diseases 26, bronchitis and pneumonia 45 and consumption 23.

ROTTERDAM, NETHERLANDS.—Consul John F. Winters reports six deaths from small-pox and 28 new cases of the disease as having been reported during the week ending March 10, and 18 new cases with seven deaths during the week ending March 17.

COPENHAGEN, DENMARK.—During the week ending March 6 there were 130 deaths recorded ; under five years 54, over 60 years 26. Annual mortality rate 24.76. Diphtheria caused one death, croup two, whooping cough six, typhoid fever one, consumption 15, pneumonia 17, acute bronchitis 13, and violence four. No death is recorded as caused by small-pox, measles, scarlet fever, diarrhœal diseases, erysipelas or puerperal fever.

During the same period the following number of cases were reported by physicians: Scarlet fever 28, diphtheria 10, croup four, whooping cough 45, typhoid fever five, diarrhœa 67, erysipelas 24, puerperal fever two, bronchial catarrh 309, pneumonia 61 and tonsilitis 125.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 96 deaths during the week ending March 3 ; males 51, females 45 ; under five years, 38 ; over 60 years, 19. No death was registered from small-pox, whooping cough, or typhoid fever. Measles caused five deaths, scarlet fever five, puerperal fever one, diphtheria and croup three, diarrhœa seven, consumption 11, pneumonia 12, bronchitis nine, and violence four.

The following cases were reported during the week ending March 10: Measles 44, scarlet fever 25, puerperal fever one, erysipelas two, whooping cough nine, diphtheria 11, pneumonia 15, pleurisy one, and bronchitis 91.

VIENNA, AUSTRIA.—Consul-General Jas. R. Weaver sends report for the week ending March 10. Total mortality 471 ; under five years, 172 ; annual rate 32.7. Diphtheria caused nine deaths, whooping cough nine, tyyhoid fever three, small-pox none, measles one, scarlet fever two, consumption 114, and acute diseases of the lungs 78.

ST. PETERSBURG, RUSSIA.—Consul Edgar Stanton reports for the week ending March 3, 744 deaths ; males 430, females 314 ; under five years, 329 ; over 60 years, 84 ; population 929,525. Fever caused 43 of the deaths and small-pox 14. On March 4 there remained under treatment in the city hospitals 1,209 cases of fever, 64 of small-pox, and 1,244 of venereal diseases.

Reviews of Books.

FIRST ANNUAL REPORT OF THE BOARD OF HEALTH OF KANSAS CITY, for the calender year 1882. Kansas City, 1883.

It has been a long time since we have seen a municipal health report which has pleased us more than this unpretending pamphlet of 44 pages.

Although it is entitled the Report of the Board of Health, it is really the report of the City Physician and Health Officer, Dr. John Fee, and it is a straightforward, common sense statement of what has been done and what ought to be done to preserve the public health in Kansas City, which is by no means confined to vague generalities and fine writing about the horrors of sewer gas.

The mortality of the city for the year, as calculated by Dr Fee, is extraordinarily low, being 14.5 per 1,000; so low as to make it extremely probable that his estimate of 70,000 as the population is too great and that it is more near 60,000. The total number of deaths was 1,023, of which three were due to scarlet fever and 10 to diphtheria. In each case during the last six months, where one of these two diseases has been reported, the house has been placarded, and the results are reported as gratifying.

As regards small-pox, the erection of a small-pox hospital is strongly urged and the argument is well put. He says : "There are two ways to protect any city from the ravages of this scourge ; these are vaccination of the people, as much as possible, and isolation of diseased persons in a hospital. One of the greatest benefits of removing to hospital is that all infected bedding can be removed with the patient, and subsequently destroyed. The health authorities can never control infected property in residences as well as they can when it is once in their possession at a hospital. Furthermore, at the time most persons would be removed to hospital the disease can scarcely be said to be contagious. Persons exposed to contact with small-pox most invariably escape infection before the fifth day of the disease, and not until the seventh day does it become highly dangerous and contagious. A good small-pox hospital is almost as useful to a city as a good fire department." In the discharge of official duty, Dr. Fee says that he has seen in the past two years three hundred cases of small-pox. He "frequently went into houses where the disease has been hidden for weeks, in which the air was saturated with the germs of the disease." He made regular inspections of the pest house, his lungs were filled with its loathsome air, yet he escaped without a symptom, although he had no other protection than vaccination. The physician in charge of the island hospital had no protection but vaccination, and such was his confidence in it that he took his family to live with him on the island at the hospital. The cook, also, and about one-half of the paid nurses of the hospital have had no other protection except vaccination, and all these parties escaped the disease. In many instances vaccinated members of a family were taken with their relatives as nurses, as provided for by law. In this way the mother or father accompanied children, the wife the husband, the brother a brother, the sister a sister. It is a singular fact that every vaccinated person who thus accompanied friends to the island escaped the disease, except in one instance, in which an old lady who went with her child, which died, had a few days of fever, and one or two patients from varioloid."

In October last Dr. Fee sent out a circular letter to the health officers of the large cities of this country, asking for information on various points with regard to municipal sanitation, and he prints some of the replies received, which we regret that we have not space to quote. A very considerable part of the report is devoted to questions of sewerage and house drainage, and the views are not only sound, but so stated as to be very good reading. For example : "There is one grave fault in the construction of sewers in this city, from a sanitary standpoint, and a sanitary standpoint covers everything in relation to sewers, as they have been invented strictly for sanitary purposes; that fault is the absence of man-holes, used as ventilators between catch basins."

A considerable space is devoted to house drainage. We notice an illustration submitted by one architect, and printed without comment, that is hardly a model in these days, though it may be better than work hitherto done in Kansas City. The City Council are urged to "pass a law which shall forbid any plumbing for house drainage in this city, unless the plans and specifications of the same shall

Digitized by Google

: been approved by a Board on house drainage, which l consist of the city physician and city engineer *ex io.*"

t is well stated that "it is better to comprehend this ject now than to wait for years and then have to tear half the plumbing in this city."

PRIZE ESSAYS ON RIVER POLLUTION.

Prizes were offered in 1880, by his Majesty the King of Saxony, in connection with the International Fishing Exhibition, at Berlin, for the best essay on "The Pollution of Water Courses and its Prevention, with special reference to the Life and Health of Fish." None of the essays submitted, however, were adjudged worthy of the prize, and the King of Saxony has now transferred it to the committee of the German Sanitary Exhibition, to be awarded for the best essay on the following theme:

(*a*) What are the sanitary, industrial, agricultural, and other interests (including those of fishery) which are endangered and injured by the pollution of water courses, as caused partly by the utilization of them for various purposes, partly by the influx of refuse and sewer waters?

(*b*) Precise statement of chemicals, machines, architectural constructions, considered to be the most effectual means against such pollution, and demonstration of the chemical and economical practicability of propositions relating thereto. The addition of drawings, models, and preparations serving to give better explanations will be indispensable in certain cases.

The prize offered by the King of Saxony is a silver "jardiniere." The German Fishery Association also offers an award of 600 marks, and the Committee of the German Sanitary Exhibition offers two prizes of 100 marks each.

Manuscripts, etc., must be directed, post free, to Dr. P. Boerner, 8 Burggrafen Strasse, Berlin, W., before December 31, 1884, to whom all inquiries should be addressed.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

06 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

Excelsior Indirect Radiator.

Manufactured by
PIERCE Steam Heating Company,
BUFFALO, N. Y.

Circulars sent on application.

THE "ECLIPSE" Hand Pipe-Cutting Machine.

THE "ECLIPSE" HAND PIPE-CUTTING AND SCREWING MACHINE will be found a very convenient and efficient substitute for the heavy and costly Power-Machines usually employed to cut the larger sizes of Wrought Iron, Steam, Gas and Water Pipes.

While it is substantially built, and designed to work easily and without strain on any of the parts, it is at the same time very compact and portable.

It will cut off and thread 2½, 3, 3½ and 4 inch Pipes, and is so powerfully geared that a stout boy can easily cut and thread 4 inch Pipe with but a 12-inch Crank.

PIPE-FITTERS AND INDUSTRIAL ESTABLISHMENTS, who have occasion to cut Pipes within the range of the "ECLIPSE," will find it a most convenient and labor-saving tool, and as such we invite their attention to it.

We have in course of manufacture, and will soon place upon the market, another size "ECLIPSE" HAND PIPE-CUTTING MACHINE, *to cut pipes from ¼ to 2 ins. inclusive.* This machine will be very light, convenient, and in every way well adapted for Pipe Work of these sizes, and will be sold at a price within the reach of any one having use for such a tool.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

MEYER, SNIFFEN & CO.'S

No. 1

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER WATER-CLOSET.

With the Cistern from which it is supplied, a pair of Brackets, the Floor Lever Chain and necessary fittings, except the lead pipe and trap.

The names of some of the parties using them and those having them for sale with full descriptive circulars, will be mailed on application to us.

MEYER, SNIFFIN & CO.'S No. 3 A

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER'S *ARTISAN HOPPER*,

WITH IMPROVED FLUSHING RIM.

FLUSHED FROM OUR

No. 2 A Preliminary Flush Cistern.

PATENTED.

Complete with seat, and all attachments ready for putting up, except lead pipe.

This is an admirable arrangement for Stores, Tenement Houses, Servants' Use, or any public place, where people neglect to lift the handle or properly flush an ordinary Water Closet.

This Hopper is of Earthenware, of novel shape, and with improved flushing rim, when supplied and fitted up as shown herein, always clean. When seat is depressed, a valve is raised, and Service Box filled with water, to extent of two and a half gallons. When seat is relieved of weight, the valve before referred to is closed, another one opened, when the contents are suddenly delivered through an 1¼ pipe to the Hopper, carrying all solid matter through the trap.

By a valuable improvement in the construction of our No. 2 Cistern—which is patented—a preliminary flush of half a gallon is secured, which thoroughly wets the entire inner surface of the hopper. The trickle is dispensed with, thus economizing the use of water, and very much better results are secured.

In ordering, describe as "*Meyer, Sniffin & Co.'s No. 3 A Water Closet Apparatus.*"

These Hellyer Hoppers are sold with various flushing apparatus, their efficiency largely depending on the selection. It is for this reason that we never sell the Hoppers unless we are satisfied that the flushing arrangements are suited for the particular duty required.

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, itis designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

MEYER, SNIFFEN & CO.,

Sole Eastern Manufacturers of the

Fuller & Fuller-Meyer Faucets and Fine Plumbing Materials, and Dealers in Water, Gas and Steam Supplies,

46 AND 48 CLIFF STREET, NEW YORK.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and inspect them.

Manufactory, FLATBUSH, L. I

BENNOR'S

Syphon Trap.

The only Brass Trap in the market.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

Agents wanted. *17 North 9th St., Philadelphia, Pa.*

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

DEMAREST'S

Patent VALVE WATER CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

We take great pleasure in calling the attention of our customers and all interested in fine sanitary work to the "Premier" water-closet, which is in all respects the same as our "Hygeia" Cistern Closet, only it is fitted with a large Valve (one inch water-way) suited to all pressures.

The valve is of the simplest kind, reliable and perfect in operation; it is positive in action, being operated by lever as shown in cut. The flushing rim ensures the wash of every part of the closet, and what is a most important feature, this is accomplished almost entirely without noise.

THE "PREMIER."

SIDE-OUTLET VALVE CLOSET.

THE "DEMAREST."

SIDE-OUTLET VALVE CLOSET.

The "Demarest" is undoubtedly the most popular closet of the kind in the market. Its large and largely increasing sale being proof of its superiority where a first-class article is required at a moderate price.

THE "CLIMAX."

DIRECT-OUTLET VALVE CLOSET.

The above is a very reliable direct-outlet closet, and has given good satisfaction wherever it has been used. The outlet is full four inches, which is an important feature in this style of closet.

We furnish Enameled Iron or Imported All-porcelain Slop Safes to fit all the above Closets.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, SENT ON APPLICATION.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

And may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

Publisher's Department.

THE SANITARY ENGINEER, *Conducted by* HENRY C. MEYER, *is published every Thursday, at 140 William Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.*

"A large and flourishing weekly journal, covering the whole field of Sanitary Science and recognized as a leading authority upon the subject."—*The Nation.*

"It is gratifying to see that the public, as well as specialists, are enough interested in Sanitary matters to give substantial support to a periodical ably endeavoring to impart much needed and vital instruction."—*N. Y. Times.*

"THE SANITARY ENGINEER shows an excellent appreciation of what may be done in the field of Sanitary Engineering, and a practical ability for doing it."—*N. Y. Tribune.*

"The recognized American authority on all departments of Sanitary Engineering."—*Cincinnati Gazette.*

"It has done an excellent work in disseminating the most intelligent opinions on Sanitation."—*Springfield Republican.*

"THE SANITARY ENGINEER has done a noble work in the field it has chosen."—*Boston Herald.*

"THE SANITARY ENGINEER is, beyond question, the ablest publication of its class in this county. The papers prepared for it are from the pens of the ablest experts, and treat of specialties the discussion of which is essential to an intelligent comprehension of sanitary growth and progress."—*Memphis Appeal.*

"The leading journal of the kind published in the United States."—*Troy Times, Dec.* 11, 1882.

"The best journal of its class in this country."—*Bridgeport Standard, Dec.* 30, 1882.

"Standard authority on matters pertaining to its specialty."—*Am. Machinist.*

"It is a journal with a mission—that of raising the low standard of Sanitary Engineering which exists in the United States. Its large editorial staff includes the names of some of the best known and most practical writers in America on health subjects, and no pains or expense are spared in making the paper useful to the fullest extent."—*Engineering, London.*

"It would be impossible to point out a publication in which the department of public sanitation receives greater or more careful attention than in the journal of which we have received the fifth and sixth volumes. Whatever fault may be found on this side of the Atlantic with the newspaper press of America, it is an undoubted fact that that portion of the periodical literature of the United States which is devoted to science, occupies a most distinguished place amongst the scientific press of the globe. THE SANITARY ENGINEER stands high in this respect. In its pages the various subjects relating to public health—drainage, water supply, ventilation, heating and lighting—are most conscientiously attended to, shortcomings and abuses being fearlessly exposed, and care being taken to have all expressed opinions upon technical matters prepared or revised by specialists. What increases its value to the public is this, that since the Congress of the United States refused to grant the appropriation needed to defray the expenses of continuing the publication of the *Bulletin* of the National Board of Health, the conductors of THE SANITARY ENGINEER have performed that work, a display of public spirit which deserves due recognition."—*Iron, London., Jan.* 12.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

WATER SUPPLY OF CITIES.

The consequences of the aggregation of population in one spot are far reaching. A casual observer would find it difficult to realize the fact that the existence of New York, Philadelphia and Boston has a direct effect on the comfort and the pockets of residents of wild and sparsely settled districts fifty or sixty miles from these centres of population, in regions untraversed by railroads and incapable of being made productive. And yet, the necessity for furnishing to the thronged denizens of the city a supply of the simplest necessary of life, pure water, is now causing a justifiable excitement in the minds of the farmers and property owners of remote rural regions in which water courses take their rise, and of more thickly settled and cultivated places through which these streams flow to the cities.

Both New York and Boston derive their water supply from limited areas. It has become necessary to store up the surplus waters of the wet season in order to supply the deficiencies of other seasons. This obliges large tracts of arable or pasture land in the valleys to be confiscated from the owners, and practically destroys many farms which have yielded a subsistance to their occupants for generations.

The borders of these artificial lakes are rendered uninhabitable in many instances.

Then the riparian owners on the stream below are deprived of the flow of water in the periods of filling or drawing down the ponds, and the supply of mills and factories is cut off.

More than that, it becomes essential that all the dwellers on the streams above the points where they are tapped by their larger neighbor shall be restrained from polluting the streams, and works of sewerage and of sewage disposal are forced upon them, at great expense in some instances.

The owners of property on the line of the Bronx River below the Kensico Reservoir, are reported to be organizing, and retaining expert engineers and sanitarians to claim damages for the diversion of the waters of that river to the New York water supply. The residents of the Croton Valley, near the proposed great storage reservoir, are said to be preparing to show that they will be ruined pecuniarily and sanitarily by its construction.

The cities and towns on the Schuylkill River above Philadelphia are expecting injunctions and interminable law suits, and probably costly constructions (both of law and engineering), because the Philadelphia water is unfit to drink.

The residents of the Sudbury River valley, near Boston, are aroused to a sense of the fact that their lands are taken from them, and their water privileges abridged, and that they are threatened with compulsory cleanliness, by reason of the City of Boston insisting that they shall not put their wastes in the stream which supplies water to that city. But there is no help for it, water for the cities must be had, and no private interests or convenience can be allowed to stand in the way of accomplishing this object.

THE SANITARY COUNCIL OF THE MISSISSIPPI VALLEY.

We print elsewhere an account of the meeting of the Sanitary Council of the Mississippi Valley, at Jackson, Mississippi, on the 3d and 4th of April.

A large number of boards of health, State and municipal, were represented, but the striking feature of the meeting was the presence of so many representatives of the commercial interests of the valley, in the form of delegations from cotton exchanges, merchants' exchanges, etc., and of railroad men.

At almost the last moment the Louisiana State Board seems to have concluded that discretion was the better part of valor, and forwarded some conciliatory resolutions, which the Council was strongly disposed to lay on the table, but finally—somewhat sarcastically, we fear—accepted "in the spirit in which they were offered."

The resolutions adopted by the Council indicate the purposes of the sanitary authorities of the valley with plainness and precision, and the election of Dr. Wirt Johnson, of Jackson, as President, and of Mr. Hadden, the Governor of Memphis, as Vice-President, is a sufficient guarantee, to those who are acquainted with these gentlemen, of the manner in which the wishes of the Council will be carried out.

STENCH-NUISANCES ON THE KILL VON KULL.

In January last certain residents of Staten Island made application to the Attorney-General for the abatement of the nuisances caused by the oil refiners on the Kill von Kull at Bayonne, N. J.

Several of the refiners agreed to abide by the decisions of the New York State Board of Health; and in order to ascertain the nature and extent of the nuisance complained of, an investigation was ordered by the Board. The inspection was made by Messrs. Colby, Walser and Hollick, and their report, together with the report and recommendations of the Board's Committee on Effluvium Nuisances, has been published.

Digitized by Google

The inspectors made a thorough examination of the refineries at Bayonne and from their report it appears that there are four establishments, each of which is, to a greater or less extent, responsible for the nuisances. In most cases, the general drainage of the premises was found defective, and offensive matter found an easy outlet into the creek and thence into the waters of the Kill von Kull. Offensive gases from the still are often allowed to escape into the atmosphere during the operation of "blowing off." In two of the refineries tar is used to some extent as fuel, and its imperfect combustion gives rise to much smoke. Sludge acid, however, is largely responsible for the nuisance caused by these refineries. It is stated that the four establishments produce daily 6,496 gallons of this stuff. It has a commercial value of 2½ cents per gallon, and attempts are made to dispose of this refuse in a proper manner. It appears, however, that when it is more convenient to let it run into the creek, there is no hesitation in doing so; indeed, in some cases a pipe was found, the only use of which, apparently, was to divert the flow of acid from its proper receptacle into the creek.

The report contains suggestions by the inspectors as to what changes and improvements are needed in order to abate the nuisance.

It now remains to be seen how successful the Board of Health, will be in enforcing the required changes. Those refiners who agreed to abide by the decisions of the Board will doubtless do so, but others not so bound may need special treatment. The Board of Health will be most fortunate if their first efforts in this direction are successful. Certainly no commercial industry is of sufficient importance to warrant the continuance of a nuisance to a populous district, such as may be created by an oil refinery.

We recently wrote to the secretary of the New Jersey State Board of Health, to inquire if his Board had any appropriation last year, for the enforcement of the food adulteration law, which was passed about two years since, also for copies of any recent laws on sanitary matters. We thereupon received the following reply on a postal card.

TRENTON, *April* 12, 1883.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR.—I send you as desired. The law as to foods is now to our liking. We do not feel it the duty of the Board to chase every commercial fraud, however important that may be, but as a Board of Health to look after adulterations harmful to health.

Respectfully, E. M. HUNT, *Secretary*.

This assurance will no doubt be welcome intelligence to those manufacturers of fraudulent food products who have been annoyed by the recent activity of the New York State Board of Health, and who, in consequence thereof, have been contemplating the removal of their business to Pennsylvania, where there is neither a State Board of Health, or law to worry them. If the policy indicated in this communication is adhered to, the manufacturing of adulterated food is likely to become a prominent Jersey industry, since, in the matter of location, that State offers special inducements for the employment of capital in such enterprises.

Engineer Newton's report to the Commissioner of Public Works, of this city, very forcibly states the necessity for stopping waste and for possessing the necessary authority to act effectually in the matter. The press of the city also realize the importance of this question. The Legislature is soon to adjourn, and it would be most unfortunate if the Commissioner cannot find time to make the neccessary effort. Perhaps it is proposed to provide for this matter in the Aqueduct Commission bill; it certainly should be taken care of somewhere, and by this Legislature too.

The Assembly bill, which requires the placing of electric wires underground, has been so amended in committee as to exempt electric light and telephone companies. There is no good reason for exempting any electric wires from the provisions of this bill. All of them are alike objectionable in their present position, and we trust the movement to insert all that portion of the bill stricken out by the committee will prove successful.

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XX.

VALUE OF HEATING SURFACES (*continued*).

Usually, the metal employed in radiators is iron, either cast or wrought, and the questions are often asked, Which is the best for radiators? Which gives the most heat?

If we had only to consider the relative conductivity of the metals, all other things being equal, we would say there was a little in the favor of the cast iron; but when we consider that the transfer of heat through a radiator depends entirely on the rapidity with which the air comes in contact with the surface, and the

difference of temperature between the air and the radiator, we must answer: All other things being equal, wrought iron is as good as cast, and *vice versa* for radiators, and this is actually the case when both are painted, even though the nature of one or the other of the surfaces by being roughened or rusted, may make a slight difference before painting; though whether the difference is for better or for worse, is still a disputed question. If a surface is roughened, more heat is given off by radiation than if the same metal is polished, but when the same metal has a fine smooth surface, whether caused by a film of varnish or by polishing, the air will be warmed hotter by contact with it; or, in other words, the same air will take away more heat in the same time; and as the heat given off by radiation alone, at such temperatures as we have to deal with in warming by steam, is small compared to the heat taken away by the movement of the air—by convection—under the most unfavorable circumstances, the writer holds to the opinion, that the smooth surfaces are best, without any reliable data on the subject, only observation in practice.

There are cases where cast iron appears to do better than wrought iron—in plain vertical surfaces, for instance—but this is on account of the large, plain, surfaces and large interstices which allow a more free circulation of the air and of any difference in the metals. On the other hand, horizontal coils of small wrought iron pipe give the highest efficiency, and not because they are wrought iron, but because the tube is small; a cast iron tube of the same size doing the same duty, if it were practical to make it three quarters of an inch in diameter.

The question may be asked, Why should a small horizontal pipe (say one-inch) give off more heat per square foot of surface than a large pipe, say four-inch? And does the same apply to pipes in a vertical position? It does not apply to vertical pipes, but it does to horizontal ones, and more or less to all pipes, with their axis at right angles to the direction of the air currents; the difference being greatest for the right angle, lessening with the angle until they have equal values when in a parallel direction. The reason why the small horizontal pipe has a higher efficiency is because the air which touches it at the centre of the bottom and sides takes up what heat it can for the time of contact and leaves it almost instantly, while in the larger

pipe the air which strikes the bottom is warmed just the same in the same time as with the smaller pipe, but has to pass around the large pipe in its attempt to pass upwards, forming a warm envelope to the sides of the pipe, which lessens in capacity to extract heat proportionately to its own rise in temperature. For the same reason two one-inch pipes placed side by side will warm more air than one placed over the other, for the upper pipe can only increase the temperature of the air from the temperature at which it left the lower one, and not from the temperature of the room.

The diagrams, 1 and 2 may be made to illustrate this approximately. Say the air of the room is at 60°, at which temperature it strikes the lower pipe (Fig. 1), but leaves it at 85°, taking away 25° of heat from the lower pipe and striking the upper one at 85°, but leaving it at 105°, taking away only 20° more, making the sum of the heat 45°; but with the pipes side by side (Fig. 2) from *each* pipe is taken 25°, the same as in the lower pipe (Fig. 1); the sum of which is 50.°—ten per cent. in favor of the pipes side by side.

With vertical pipes the unit of surface has the same, or very nearly the same value for all size pipes, but it has the lowest comparative value as warming surface; the horizontal position having the highest value, with decreased efficiency as the angle progresses toward the perpendicular, caused by the warm envelope of

Digitized by Google

air which has to follow the pipe a greater part of its length, or the whole length, in the vertical position, before being disengaged.

In radiators, when a difference of efficiency is found to exist, if it cannot be traced to a lack of steam, it should be looked for in the peculiar shape of the surface and the accidental position it may occupy.

For the same reason brass or copper radiators are no better air warmers, under ordinary conditions, than iron ones, though the conductivity of the metals is about double what it is for iron.

The thickness of the metal of radiators is again questioned, some claiming that the thinner the surface is the more heat can be given off in a unit of time. But this is also a mistake. After the metal is once warmed—at least for "plain surfaces," *i. e.*, with parallel sides—for the rate of the transfer of heat through the metal by the contact of its particles (its conductivity), is so many times greater than the capacity of the air to take away heat, under ordinary conditions, that it is not necessary to consider practical thicknesses for direct radiation, nor for indirect radiation where the surfaces are *plain*.

With extended surfaces the conditions are somewhat different, and vary with the kind of surface.

By extended surface is meant radiators for warming air which are increased in superficial measurement on the air side by points, cones, pins, ribs or indentations of too small a section to be cored out, while the centre steam opening is formed by a plain core of the most convenient form, which does not attempt to follow the indentations or irregularities of the outside.

A great deal of difference of opinion about extended surface is due to a misapprehension caused by viewing the question from only one standpoint.

Some claim that extended surface (generally) has the same value as plain surface, while a few claim better results for it (?), and the makers of plain wrought iron heaters claim it has a low value compared to pipe.

But to arrive at anything like a satisfactory conclusion on this subject, there is one thing that must be borne in mind continually, and that is, that it is a square foot of the outside surface in one form which is compared with the same measurement in any other form.

A maker of cast iron heaters, because he *can*, at a small cost of labor and materials, increase the surface of a section or pipe by extensions, and then tries it by the "condensation test" along side of one of the pieces before it was extended, and finds a greater amount of water formed in the same time, is very apt to go no farther with the experiment, but to come to the conclusion that the extended surface is the best, as he certainly condensed more water with it. But the point which is frequently lost sight of is, *has the increased condensation kept pace with the increased surface by extensions?*

But if we go farther, assuming that with the position of the two sections just tried, say a horizontal one, and with extensions of moderate length, say the base line at its shortest measurement to be greater than the perpendicular, that the results per square foot are the same, how long will the extensions have to be made before the extended radiator will fall behind in efficiency per unit of surface? for it is a question of length proportionate to the base. And again, if they are changed from the horizontal to the perpendicular, will the comparative results be the same, and will not the rapidity with which the air is moved over the surface effect the whole question, on the supposition that the extension has a base proportionate to its length, at which, with a certain velocity of the air, the conductivity of the iron is sufficiently great to keep the point of the cone at the same temperature as the base? With the air at greatly increased velocity, is this consistent, and does not this establish a point of unknown distance from the base, varying with the velocity of the air beyond which extended surface cannot have as great a value as plain?

Again, pipes of small diameter in a horizontal or nearly horizontal position may be extended to a limited degree, and give the same result as plain surfaces for equal quantities; but place them in a vertical position, where the air from the lower prongs or pins has to pass over all above it, taking less and less heat from each consecutive prong, and being retarded by friction, the result must be in favor of plain surface.

In extended surfaces, shapes which facilitate the movements of the air increase the value of the surface, as with any other kind of surface; perpendicular ribs giving better results than horizontal ones, as the coves formed by the horizontal corrugation hold air of a high temperature, while more air is rising at a line just beyond the points of the ribs, which has a higher velocity but a lower temperature. This last applies to any surface in this shape, whether plain or otherwise.

[To be Continued.]

SHOULD DRAINS BE EXPOSED OR COVERED?

Newport, R. I., *April* 7, 1883.

To the Editor of The Sanitary Engineer:

In reviewing the Philadelphia plumbing ordinance you recommend the adoption of the provision of the New York rules, that drains laid under the cellar floor should be laid in a trench, "walled up on the sides and provided with movable covers," etc. Let me suggest that such an arrangement provides a runway for rats and a space which is sure to accumulate dust and to harbor insects. Would it not be better, a suitable trench being first made, the extra heavy iron pipe laid, *and the tightness of its joints tested by water pressure*, to fill the whole space solidly full with grout to the surface of the cellar floor?

Very truly yours, Geo. E. Waring., Jr.

[The objections raised by Col. Waring do not appear to us to be valid. If a trench is walled up with brick laid in hydraulic cement, with a concrete bottom four inches thick and covered with flagging in a proper manner, neither rats nor insects can get into it, nor any appreciable quantity of dust.

We admit that if it were possible to ensure *perfect* workmanship and *perfect* materials, it might be advisable in some cases to bury a drain beneath a cellar floor. But we have to deal with the world as we find it, and we all know that perfection is not so easily attained in work that is to be buried out of sight as it is when the workman knows it is to be always visible, or at least ready of access. Such is human nature, and it is for the proper regulation of a community in which such human frailties are known to be common that laws and ordinances, like the one under discussion, are framed. It is much easier to make a line of drain that will stand a test when new than to make one that will endure for a term of years. Leaks and breakages sometimes occur from blow holes or imperfect or uneven castings, and if well tarred, these defects are not visible till time eats up the tar. Moreover, drains are continually made the receptacle of rubbish that should not be allowed to enter them, and will continue to be so used so long as a single house servant remains in the community who is not void of guile, or in other words, incapable of stuffing a towel, or even an old shoe into a water closet in a pet after having been discharged for incompetence. It is a matter of fact with which nearly all plumbers are familiar, that the drains in the best of houses are often opened to take out such obstructions. The writer once found a soil pipe choked by an india-rubber ball, soft and elastic, and used by the children indoors because it would not break glass, yet sufficiently firm to make a tight plug when accompanied by other substances that would be harmless by themselves. At another house a piece of beef-rib, several inches long, was the nucleus of a tight dam. Towels are probably more often met with than any other one article in such places, because they are often dropped into water closets through ignorance or inadvertance. The frequency of the need of cutting into drains, or getting access to them through hand-holes, is too manifest to admit of dispute.

It is needless to say that such troubles are greatly simplified by keeping drains accessible just as far as possible, or, at any rate, for every foot of their length within the walls of our houses, where the process of digging them out would be vexatious and annoying beyond reason. Of course, we can imagine exceptions where the rule in question might, perhaps, be varied without danger, but in framing such general rules, it is not admissible to provide for such isolated cases We must expect all manner of devices on the part of cheap jerry builders to avoid cost by cheating the inspectors, and if we overtax the force on which we depend for inspection, we are entirely adrift, and might as well have no law about it. The problem is only to be solved by keeping the drains *in sight*, or readily accessible, so that defects can be easily detected, whether in new or old work.

We firmly believe that until this is required we shall not cease to hear of the ground becoming defiled under dwellings by having continued drain leakage, for nothing is more certain in such matters than the old saying, "What is out of sight is out of mind."]

TREE PLANTING AND FOUNTAIN SOCIETY OF BROOKLYN.

We are pleased to note the revived activity of the Brooklyn Society for the encouragement of tree planting and the establishment of drinking fountains, and we gladly give space for the publication of the following address to the citizens, recently issued by the executive committee of the Society:

"This society, established for the purpose of promoting the planting and protection of trees in this city, presents the following suggestions to those who may feel disposed to lend their aid this season toward rendering the city more attractive, and at the same time adding to the comfort and pleasure of the people: In the first place, it is very desirable to secure concert of action. Instead of individual effort, it would be far better if the residents of a block should combine and employ a competent person to set out a certain number of trees. The effect would be that others on the same street would soon follow their example. At the outset the question of light and shade should be carefully considered, in order that houses should not be rendered damp, or the free circulation of air obstructed. In narrow streets but one side, perhaps, should be planted, as less exposed to the sun than the other, excepting the corners of streets, and the trees selected should be those of an upright growth and well proportioned.

"The space dug out should be at least three feet each way, one or more cart loads of the sand and other material used in making the sidewalk removed and its place supplied with good fresh soil. Trees selected should be those raised in the nursery and which have by occasional transplanting developed a compact mass of healthy roots. The stem should be smooth and straight, the bark unbruised, and the head evenly proportioned. The best success is usually had with trees from one and a half to two and a half inches in diameter. If some of the roots are broken in removal, pare the fractured ends smoothly with the knife, so that the wounds may be quickly healed; then replant the tree carefully, placing the earth about the small roots and with gentle pressure bringing it into firm contact with them, settling it occasionally and watering it according to the season. The box for protection should be lined, where likely to come in contact with the tree, with leather, wool, or some soft substance, and firmly secured at its base. Barking and rubbing must be avioded. The flagging should be cut away so as to leave a space of at least two feet square around the tree, the earth kept loose and frequently watered, and the tree properly trimmed.

"Location should govern to a great extent in the selection made. The American elm and oak and Oriental sycamore are broad spreading trees on avenues. Many select the silver maple on account of its rapid growth, but its branches are thin and easily broken. Sugar maple, scarlet maple, Norway maple, and several varities of elms are among the best for narrow streets, but the sugar maple is perhaps the best of all. It is a tractable tree, strong, shady, clean, of rapid growth, and generally symmetrical in shape. We shall at all times be pleased to impart any information we possess, and to coöperate with the public in rendering the city attractive. One drinking fountain, at least, should be furnished this spring, and we urge those who feel inclined to unite with us in this work to send their address to the treasurer, Gordon L. Ford, No. 97 Clark street. The annual dues are five dollars."

Mr. J. C. Parsons, chairman of the executive committee and author of the above circular, writes us as follows in regard to the urgency of establishing drinking fountains:

"In view of the action of Dr. Raymond, the Health Officer, with respect to closing up the pumps, the waters

Digitized by Google

of which have been decided to be unfit for use and calculated to produce disease, it is of the utmost importance that drinking fountains should be erected in our streets. It is a question that certainly should interest every good citizen, as conducive to the health and comfort of the people and an offset to the spread of intemperance. People will get thirsty in hot weather; will drink; if water is not at hand, then something stronger. One fountain should be started this spring, but we must have members first, or some generous individual, contribute towards that object. No man can have a better monument, one that will keep his name fresh and green in the hearts of thousands who stop for a cup of cool water, and recall while drinking, the citizen to whose liberality and kind feeling they are under obligation."

THE SEWERAGE OF BINGHAMTON.

Mr. Rudolph Hering and Col. Geo. E. Waring, Jr., were employed to make reports on a sewerage scheme for Binghampton, in this State. Mr. Hering's recommendations were adopted, whereupon Col. Waring wrote a criticism on Mr. Hering's suggestions. To this criticism Mr. Hering has replied. In this controversy the advantages of the respective systems are discussed, and considerable of general interest to our readers is elicited. We have, therefore, in this issue devoted considerable space to Col. Waring's paper, and will give Mr. Hering's reply in our next issue.

To the Citizens' Committee, Binghamton, N. Y.:

GENTLEMEN:—Had Mr. Hering's report been published when I wrote my suggestions as to the sewerage of Binghamton, I should have commented, at that time, on some of his recommendations. It is right to do so now.

The difference between the system that he adopts and my own is much greater than would at first appear. Both are of the same class. One is the well known and long used "Separate System" of England; the other is a system of absolute separation with modifications designed to reduce the cost of construction and maintenance, to avoid obstructions, to preserve in the sewer a constant condition of cleanliness, and so to prevent the formation of "sewer gas."

The first use was made of these modifications in Memphis, where they have stood the test of three years' use in a trying climate, largely among a careless negro population, and generally under circumstances less favorable than those of Binghamton. Their application in Memphis has been on a very large scale—about twenty miles of sewers in 1880 and about forty miles in 1882. These sewers have been examined—to the degree of very close scrutiny—ever since their construction was begun, and by no means always with a desire to find them successful. So far as I know, no unfavorable report concerning them has ever been published. They have invariably been found and reported to be clean and entirely free from the odor of decomposition, to perform their duty in a satisfactory way, and to meet every requirement contemplated in their construction. There have been a few stoppages and these have been easily and cheaply removed.

In the winter of 1881–2, owing to an inordinate waste of water (to keep pipes from freezing) the main sewer was overcharged; but even if this had been due to a defect of the main—and it was not—it would not have been to the discredit of the system itself.

Since 1880 this system has been adopted for, and more or less completely constructed in, Little Rock, Ark., Omaha, Neb., Kalamazoo, Mich., Birmingham, Ala., Norfolk, Va., Wilkes-Barre, Pa., Pittsfield, Mass., and Keene, N. H. So far as I know, all reports from all of these places have been entirely favorable. In some of them the system is in full working; in others it is in course of construction.

Probably it was in part Mr. Hering's proper hesitation to recommend patented improvements, on which his clients would have to pay a royalty—a recommendation that should never be made lightly—that deterred him from following in this regard the suggestions of my earlier report to you.

He has adopted in his plan for Binghamton, and elsewhere, the separate system, as it is carried out in England. I think he has made a mistake.

The English separate system was introduced by Pilbrow, at Tottenham, about 1851. It has had some adherents ever since. For a long time it had very few among the better sewerage engineers. It is not a strictly *separate* system; that is, while it excludes street wash, it admits roof water and, generally, water from back yards. This for two reasons: First, to provide for the flushing of the sewers by storm water, which, in that country of frequent rains is, for a good part of the year, tolerably effective; and partly—and this is important—because, under the English law, a householder cannot be required to make two drains from his premises, nor can he be prevented from admitting roof and yard water to the drain that he does make.

Neither is there any absolute restriction as to the provision he must adopt to secure the exclusion of rubbish from his yard drain.

Therefore, the "Separate System" of England is a *restricted* rather than a separate system. In order to provide, so far as practicable, for the removal of materials admitted to drains from yards, it begins usually with a diameter of 9 inches, and it increases very rapidly in size up to 12 or 15 inches of pipe and larger sizes of brick sewers.

Latterly, the system has had considerable extension, in the case of towns which have been required by legal process to refrain from delivering their sewage into water courses until purified by irrigation or other process. Compliance with the requirement is made cheaper by this restricted system than by a full storm water system, because the amount of water to be handled in wet weather is much less than if the street wash were added.

While in London last Autumn, I had conversation with several engineers who have recently constructed works of this kind. Their tone was universally to the effect that it was a system which would *do*, and would generally do very well under circumstances where it was necessary. The number of those practicing it who gave me the idea that they would practice it in the absence of the legal requirements above referred to, was small.

The objections to the system, which have much greater force here than they have there, because of the much longer periods during which with us there is no rain, and because of our heavier rains, are as follows:

1. Owing to the great size necessary to give to the pipes, the flushing effect of the daily maximum flow is enormously reduced, so that, even with the short intervals of drought in England, deposits in the sewers are very common, and the rainflow is frequently only sufficient to wash together these deposits and the rubbish admitted into the court yards, forming actual stoppages. The need for constant watching and frequent removal of obstructions is very great, and has been cited in engineering discussions as a serious objection to the system.

2. Of course, the deposition of material between storms, if it lasts more than a day or so, becomes a source of great foulness, and the atmospheres of these sewers is worse than that of ordinary storm water sewers. One engineer, who has always been a champion of the separate system, showed me the drainage of a large private house and grounds in London, executed under his direction, and regarded by him as a model of excellence. It depended for its flushing on roof and yard water. It had rained within a week, yet on opening some of the well-ventilated manholes to examine the sewers, the air was found to be as foul as that of an ordinary house drain or cesspool.

3. The system is very costly. If rain-water is to be admitted even from the smallest surface that will give a flushing quantity during moderate rains, it is necessary to give the sewers a sufficient capacity to remove *all* the water that can fall on this surface during a sudden, heavy shower, when from 1 to 2 inches in depth over the whole surface must sometimes find its way to the sewers within an hour—occasionally within much less time. If the sewers are not of ample size, sewage sets back into house drains during such storms. It is this requirement for large diameters which makes the sewers so foul, as indicated above, and which makes them, in my judgment, quite inadmissible here, where there are often very long intervals between storms.

To give an idea of the cost of such work, I have had prepared an estimate of the sizes that would be needed for a sewer beginning 25 feet west of Third Avenue in New York City, and discharging into a sewer in Sixth Avenue, a distance of 2,985 feet; supposing it to have a fall of 1 to 200, draining every house on the way—the area being fully occupied and peopled—and receiving the rainfall from roofs and the paved portions of yards equal to a width of fifty feet on each side of the street. The calculation assumes a rainfall of one inch per hour, reaching the sewers at the time when they are carrying the maximum flow of house sewage. I give an estimate of the cost of the pipes required and the cost of laying the same, *not including trenching and back filling*, and not considering the extra cost of the wider trenches for the larger pipes, but including the cost of man-holes made necessary by the liability of such sewers to become obstructed, and offsetting these with the cost of a flush tank at the head of a single line of 6-inch sewers.

Beginning with 8-inch pipes, we should require the following lengths of different sizes:

8-inch	393 feet,	cost including laying	30½c.	per foot,		$119.87
10-inch	320 "	" "	"	46	"	147.20
12-inch	530 "	" "	"	53¼	"	282.22
*15-inch	1742 "	" "	"	82	"	1,428.44
Man-holes, 9 at $40,						360.00
						$2,337.73

If all the rainfall were excluded, and the sewer had to carry only the house drainage, but a liberal allowance of this, the whole line might be made with 6-inch pipes. Hand-holes and short lamp-holes could be substituted for man-holes, and a flush tank at the upper end of the line would clean the whole length at least once a day. Such a sewer, with its flush tank and all appurtenances, would not cost more than $900, excluding trenching and back filling, as in the other case, *but including royalty.*

It is proper to say that wherever the English separate system is carried out, provision is made for flushing through man-holes; but this requires personal attention, which is never reliable, while the opening of man-holes leading to small pipes is a frequent source of the admission of substances which cause obstructions. The total cost of flushing and cleansing cannot be arrived at with accuracy; but it is in all cases necessarily much greater than the cost of a supply of water to an automatic flush tank, and of the rare removal of obstructions—which must have passed through 4-inch house drains, and which are little liable to be arrested so as to form accumulations in well flushed 6-inch sewers.

The proportionate cost, as shown by this example, would hold good, with perhaps an addition of $100 for flush tanks where several branches would take the place of one straight line, in Binghamton or elsewhere.

It seems to me, therefore, that Mr. Hering, while he would save your city the payment of ten cents per foot royalty, and while he would shield himself from the charge of adopting a patent, would lead you to the payment of about 47 cents per foot in *additional cost*, and to the construction of a very crude, imperfect and unsatisfactory system of sewerage.

Mr. Hering, in his report, thus sets forth "the main principle to govern the design of your works:"

The conditions presented in the city of Binghamton are such, that while provision should be made for the reception of sewage on every street, the storm-water can to some extent flow away entirely on the surface. But there are localities where it also must be removed underground, and it then becomes a question whether it should be taken into the sewers or into separate channels.

In both cases the entrance of silt and gravel will have to be prevented as much as possible, particularly in sewers, as much of it would deposit and retain the foul matters also. Yet this care is almost as necessary for the channels carrying only the street water, as the rubbish, horse manure and filth washed into them sometimes makes them as foul as a sewer.

In general, the relative economy of the two methods for a particular district can be determined by the circumstance as to whether the removal of rain water will have to be practically as deep as that of the sewage. If this is the case, one channel for both purposes will be less expensive. Again, if a combined sewer requires but a little greater excavation than one for sewage alone, it will ordinarily also cost less than to build two separate sewers.

It has been the common custom, where separate systems were used, to admit everywhere with the sewage also at least some of the rain water from the roofs. And this has been done for the following reasons:

First.—While much of the water falling upon the gardens and streets is absorbed and evaporated, nearly all of the roof water flows off and reaches the streets. To lead it away under ground will therefore materially diminish the amount running through the yards and in the gutters. This relief to private premises, though not affecting the sanitary question, is usually considered very desirable. It is quite frequent that we find a sub-surface removal of rain water, where sewage removal is not yet thought of.

Second.—The entire exclusion of roof water from sewers necessitates the construction of two separate drains from the houses, if it is to be taken away underground. While this adds expense to the owners, it has also been found a source of annoyance by the maintaining of two pipes where one will do as well; not to speak of the possibility of workmen connecting with the wrong sewer,

*Theoretically the lower 700 feet of the sewer should be 16-inch and 17-inch diameter. The 15-inch will work under a head below this point.

Digitized by Google

which has been not unfrequently found to occur even in England, where municipal work receives more care than here.

Third.—The admission of clean water from roofs is of great benefit to the sewers, as it gives a continuous flush at times of rain, washing them out more effectually than can be done by flush tanks alone, though these are excellent aids in dry weather,

Where it has been necessary to pump the sewage in order to finally dispose of it, the amount of roof water has been reduced and sometimes excluded entirely. But no such restriction is necessary in your case.

For these reasons I would recommend to you to have some of the roof water from every house led into all of the sewers. The slightly increased size of pipes for this purpose—there being no increase of excavation necessary—is repaid not only by a correspondingly less size of special rain water channels, and a reduction of the amount of water running through the yards and in the gutters in summer, and of less ice about them in winter, but also by a better cleansing of the main house pipes and sewers, which is a most essential consideration. After many years' experience in England, this practice is now advocated there by the best authorities.

With the outfalls at the mouth of the Chenango river, and the partial or entire storm water reception in the sewers advised, economical reasons now demand that, while the foul matter must be taken to the above outfalls, the storm water should be carried only to the nearest water course to save the building of large sewers where it is not at all necessary.

To accomplish this, it is customary to build intercepting sewers, which take the ordinary flow of sewage to the more distant outfall, and allow the water from heavy rains to escape directly into the rivers or creeks. Such escapes or overflows into the natural water courses, if properly located, have not been found in the least objectionable, and their use is extensive. It is true that the storm water is mixed with sewage, but the first gush of rain flushes most of the sewage in the pipes rapidly to the outfall, and the remainder is greatly diluted before any part of it ever flows into the river. The small amount of objectionable matter escaping in this way could itself not cause a nuisance, and still less when it is considered that during, or soon after storms, the creeks and rivers carry a largely increased amount of water, which would more readily wash any organic refuse away.

From the foregoing considerations there can be no doubt that it would be as unwise everywhere to totally separate the storm water from the sewage as it would be everywhere to receive *all* of the storm water in the sewers. The former plan would often complicate the arrangements, while the latter would cause unnecessary expense.

The storm water of Binghamton can not only "to some extent" but very generally flow away over the surface. There are comparatively minor areas where it may not do so, and from these areas it can generally be discharged through short lines of shallow conduits of little cost. These few channels will, of course, require due precaution and care to keep them clean, but the attention and labor required for this will be as nothing compared with what would be demanded by the proper supervision of the much more extended system of sewers receiving street wash, for which Mr. Hering would provide,

Practically, "two separate sewers" will nowhere be needed. The disposal of your surface water is such a simple problem that, in my judgment, the construction of "combined sewers" should not be thought of, even if combined sewers were as good on sanitary grounds as independent sewers, which they never are.

Mr. Hering says: "It has been the common custom where separate sewers were used to admit everywhere with the sewage also at least some of the rain-water from the roofs." I have cited above respectable instances well known in this country, where this is neither done nor needed. The "common custom" is the custom of England, where the separate system has never been made satisfactory to the majority of engineers and sanitarians.

Comparatively little of the roof water of Binghamton, except on the business streets, reaches the streets of all. Wherever it does or should do so, it should flow into the street gutters. If it were important "to lead it away underground" and "materially diminish the amount running through yards and in the gutters," it might be worth while to expend public money to secure this result; but is only important to prevent the flow of the gutters from accumulating to an inconvenient or injurious extent. It is only to prevent such accumulations that "sub-surface removal of rain water where sewage removal is not yet thought of" is properly resorted to.

"The entire exclusion of roof water from sewers" does *not* necessitate "the construction of two separate drains from houses if it is to be taken away underground;" it may necessitate its being carried by a covered drain across the sidewalk, and this may cause inconvenience at rare intervals in winter. "The possibility of workmen connecting with the wrong sewer, which has been not unfrequently found to occur even in England, where municipal work receives more care than here." is not an argument which should apply in the case of any community proposing to construct a new system of sewers. The tendency of all American practice is toward the immediate supervision of house connections by Boards of Health, and nothing is more easy than to secure a uniform compliance with the requirements that house drains shall connect with the foul water sewers. Furthermore, as, under any proper system in a place like Binghamton, there would be only one sewer in at least nine-tenths of the streets, this objection, if it existed anywhere, would not apply in this case.

"The admission of clean water from roofs" can be of benefit to the sewerage system only when the rain fall is large enough for *thorough* flushing. It is quite true that *heavy* storms under such circumstances, would give a continuous flush and wash them out more effectually than would flush tanks alone, *if these worked only at such intervals.* Many a light rain falling after there had been a couple of week's accumulation of filth in the sewers, would be as likely to wash this into masses and obstruct the sewers as to wash the sewers clean. Even if we admit the full benefit claim, what shall we say of the condition of such sewers depending on this means of flushing alone, when rain does not fall oftener than twice a week? And what when it does not rain at all for a month? The fact is, as proved by ample experience, that the daily or half-daily flushing of separate sewers with automatic flush tanks settles for good and all the whole question of deposits and of uncleanliness. Therefore the recommendation for the admission of roof water is, in my judgement, ill advised. The size of pipes required therefor would be by no means "slightly" increased, as the illustration already given clearly shows. For example, in my system, where great lengths of 6-inch sewers are used, the cost of the pipe and laying is not over 18 cents per foot. Mr. Hering begins with 8-inch pipes which cost, with the laying, 30½ cents per foot. The difference of cost of this size therefore is 25 per cent. greater than the royalty charged on my system, while he must soon run into larger sizes, increasing the cost enormously, as shown above. As "the special rain water channels" would usually be the street gutters, a slight increase in their size would not be material. Minor house pipes and house connecting drains are pretty efficiently flushed by any of the modern (and only acceptable) forms of water closets, so that "this most essential consideration" satisfies itself. As stated above, "this practice is now advocated" in England only because under English law there is no alternative.

Under the plan that I recommended there would be saved the large sum required for Mr. Hering's intercepting sewers with properly arranged overflow discharges into the rivers or creeks. Unless the intercepting sewers were made very large and very costly, as compared with the necessary cost of the general sewerage work, even light storms, which would not at all affect the flow of the river, as local storms very often do not, the amount of filth delivered into the river *would* be seriously objectionable.

The generalization with which Mr. Hering concludes his recommendation has, I think, no proper application in this discussion as applied to towns like Binghamton. If by "the former plan," he means my plan, there would be no such complication as he refers to.

If Memphis has proved anything, it has proved that man-holes and lamp-holes for the inspection of the interior condition of the sewers are not necessary, and if the custom of American city engineers is to be taken as a guide, such man-holes and lamp-holes are not used for this purpose after they are built. I dissent entirely from the opinion as to the relative advantages of making turns with short curves in man-holes and making them with long curves in the line of the sewer.

"English experience of many years has shown that six-inch pipes, although theoretically large enough, are comparatively much more liable to stoppage from obstruction, which even regular flushing could not prevent, and many have been replaced by larger sizes," because of the absence there of authority to prescribe the exclusion of surface water and its rubbish from the sewers. I have shown by nearly five years' experience in Cumberland Mills (Maine), and by more than three years' experience in Memphis and shorter experience elsewhere, that with perfectly feasible regulations, 4-inch pipes are ample for all house drains, and that we can safely adopt this size, which will, of course, keep itself much cleaner than would drains of six inches or more. Mr. Hering says: "The advantages of taking away roof water in the sewers by obtaining an occasional heavy flushing, by relieving private premises of much of the rain water, and also by reducing the quantity washing down the streets, all fully justify its underground removal as one of the main objects of building sewers." I submit to the consideration of anyone familiar with the soil and arrangement of buildings in Binghamton, that if the flushing of the sewers can be more perfectly accomplished by cheaper means (as it can by automatic flush tanks), there is nothing in the above suggestions which would at all justify the doubling of the cost of the work needed to relieve the city of its impurities.

He also says: "Experience with the sewers will soon tell how often an inspection of the different sewers is necessary to avoid serious accumulations." Experience with the forty miles of sewers in Memphis shows that with sewers arranged as they are there, such an inspection is never necessary, obstructions being so rare that the cost of their location and removal is less than would be the cost of even a monthly inspection of the whole system by man-holes and lamp-holes; which, as I have already said, would not be used if they were built.

It is quite true that "catch basins should be regularly cleaned after every rain;" it is also true that they never are so cleaned and that they are apt to constitute an intollerable nuisance in paved streets from which much horse manure and other filth is deposited in them.

It is recommended to ventilate the sewers "by giving access to the outer air at all manholes;" also, as these man-holes' openings are subject to obstruction, "to ventilate sewers through private house pipes which are extended beyond the roof." Wherever this latter has been adopted, the ventilation is complete without reference to man-holes. Where man-holes have been relied on without ventilation through house drains, they have never been effective in connection with pipe sewers.

The foregoing criticism is sustained by the distinctly expressed opinions of prominent leaders of the modern movement to improve the conditions of public health—opinions based not on the engineering customs of any country, but on a careful study of the merits and defects of public and private drainage works, in England and elsewhere. The introduction of the English separate system marked a great and most beneficent advance on the processes prevailing thirty years ago. It has not been changed in principle or in arrangement from that day to this. As Chadwick and Rawlinson and Pilbrow started it, so their followers have kept it going ever since.

Within these thirty years our knowledge of all sanitary branches of engineering has widened vastly—one thing that it has compassed has been a radical and much needed remodeling of the "separate" system of sewerage. This improvement is not only correct in theory, but it has been proven and approved by extensive practice, and found to offer an easy, safe and economical solution of difficult problems in town sewerage which previously existing systems do not meet.

To disregard this development and go back to the infancy of sanitary engineering for a more costly and more crude process would seem a curious course for a modern American community to adopt.

GEORGE E. WARING, JR.

NEWPORT, R. I., *Feb.* 1, 1883.

Dr. D. F. Lincoln, in a paper read before the Social Science Association, of Philadelphia, the 25th ult. on "School Hygiene," said that "The best system of ventilation would be by a steam fan. A good device is the shaft or draught chimney, which is kept 'drawing' by the iron smoke flue from the heater which passes up through it. But this system is unreliable in mild weather. For small rooms with stoves it is feasible to have each stove boxed around with an iron screen, with an inlet to throw fresh air into this box, which passes through holes into the room when warmed as the hot air from a furnace does.

"A large amount of air for each pupil does not necessarily imply good air in the absence of proper means for replenishing the supply. Early habits of reading and writing should be formed very carefully. Seats ought to be chosen so as to avoid uncomfortable and awkward positions. Excessively fine maps and fine map drawings are prejudicial, and the position of windows and quantity of light supplied are of the greatest importance to prevent injury to the eyesight of the pupils."

PLUMBERS' PROFITS.

CHICAGO, *April* 11, 1883.

To the Editor of THE SANITARY ENGINEER:

I was well pleased to read your able and manly editorial on "Plumbers' Profits."

Plumbers' profits! What are they? I have been searching for them the last seventeen years. Occasionally I have been taken by the hand and thanked for the quality of my work; in one case I was told I had added ten years to a man's life; in others the children have recovered from their fevers and the credit has been given to me. But the dollar and cent rewards have not yet come, nor will they come until the plumber educates the public to the fact that a good workman is as much entitled to a fair competency as any other business or professional man. In order to have our work well executed, we are forced to pay from $4 to $4.50 per day to a plumber, and $1 per day to a helper. If we charge $6 per day for these services, we are expected to pay out of the difference 75 or 50 cents, rent of store, necessary clerk hire, horse and wagon, taxes, wear and tear, etc. For ourselves, we are expected to live upon air and water, clothe ourselves with the leaves of the forest and die contented. Again, many of us have been reared in the lap of poverty, and gained our education as street Arabs, but we are expected to combine the knowledge of a chemist, the art of an architect, the skill of a mechanic and the morals of a Washington.

Commercial society recognizes the divisions of *merchants, the manufacturer*, whose province is to learn the wants of society, to supply these wants in a cheap and elegant manner consistent with their durability and utility, through the *the wholesale men*, and these to the community through *the retail merchant*.

Each of these divisions is necessary for the economical distribution of merchandise. For instance, the *retailer* in one locality learns all the details essential to the purchasing, display, and selling of the different line of goods in his vicinity, and another the desires of his customers in another locality. The wholesale men are thus posted by each of these retail men as to the demands of different localities, and can readily provide for them all. In fact, each retail man is the agent of consumer and wholesale men, and is entitled to a fair commission for his services. In the end the consumer is the one who profits by it. The writer would say, let manufacturers make the goods and only sell to wholesale men, and these in turn only to the retail merchant, the retailers to purchase only of the wholesale men who confine themselves to the wholesale trade. If the man who purchases his own material and hires an inexperienced though cheap man to fit it up, compares the price at which a responsible firm would have contracted to do the whole work, he will find "that he has paid too much for his whistle." The day has come when each division of commercial society must be up and doing for its own protection, must organize and defend their rights in a reasonable but firm manner; and I know of no better way for the plumbers than organization in every State, and each State to be represented in a national convention. In this manner it will tell to the profit of all concerned.

In conclusion, I will say, THE SANITARY ENGINEER is to be commended for the fair and unbiased stand it has taken on this subject; being the recognized authority on subjects pertaining to sanitation in its broadest sense, what it has to say will be well considered by society.

I hope I have not made this too long.

I remain yours, etc.,

"HELPER."

[The writer of this letter is a prominent Chicago plumber, and an active member of the Master Plumbers' Association of that city.—ED. SAN. ENG.]

STAUNTON, VA., *April* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

I have just read your articles on "Plumbers' Profits," also the letter from Worcester. This city has a population of seven thousand. There are three regular plumbing establishments, and there are four walking plumbers—that is, plumbers who get the owners and often the contractors to buy materials, and they do the work by the day. Besides, there are three hardware establishments here, and whenever drummers from plumbers' supplies houses come to this little town, they sell them goods as low as they will sell to plumbers; not only that, but they will sell a few hundred feet of pipe or a single valve to any farmer as low as they will sell 10,000 feet of pipe or a gross of valves to us plumbers.

These are facts, and I can, and will, if required, give the names of the sellers and the buyers. We all know if the manufacturers and dealers would protect us, we could get better prices, and could afford to pay better prices. I am sure, if your valuable paper will keep this question before the trade for a while, something will be done. I am afraid if we were not to buy from any but those who would not sell to consumers, we would have to close our business, for nearly all do it, but claim they have to sell to consumers because others do it.

Respectfully, etc., C. BARGAMIN.

CHICAGO, *April* 8, 1883.

To the Editor of THE SANITARY ENGINEER:

Your article on Plumbers' Profits, in your last issue, deserves commendation from the lips and pen of every employing plumber in the land.

I have known something of plumbers in this city since 1854, and I do not know of a single one who has amassed a competence, while men in other trades in the same time have become wealthy. When such papers as THE SANITARY ENGINEER are with us the battle is already won.

Respectfully yours, A. YOUNG.

PRODUCING DRAFT IN VENTILATING PIPE BY MEANS OF GAS JET.

BOSTON, *April* 7, 1883.

To the Editor of THE SANITARY ENGINEER:

I wish to produce a draft in a ventilating flue by using a gas jet for that purpose. Two arrangements of the jet have been suggested. One is about as follows:

The gas jet is set under a flat metallic hood, made double, as shown in the sketch, it being intended that the jet shall heat the metal of the lowest hood, which will in its turn

heat the air which passes in between the two hoods, or parts of the hood, as indicated by the arrows. The other is to simply inclose the jet in a small chamber or lantern in the flue, as is the very common practice. I am told I will produce a stronger current by the first method, because I heat a large surface, which in its turn heats a large stratum of air, while with the lantern I only heat a small surface of air as it comes in contact with the flame. Never-

theless, I prefer the second, because I think I can heat air better by *bringing it directly into contact with the flame*, than if I used the flame to heat a metal surface first. Indeed the idea first suggested seems to me like inventing ficticious heat to make up for the loss which always occurs in heating the metal surfaces. H. D.

[We believe the best results will be secured by the latter plan, since less of the heat is lost by radiation into the room.]

NEW METHOD OF DETECTING WELL POLLUTION.

ELMIRA, N. Y., *April* 3, 1883.

To the Editor of THE SANITARY ENGINEER:

Some years ago two neighbors of mine had a law suit about a privy. Their premises were next to each other, and it is presumed one built his privy close to the other's fence and house, when he could have taken a middle course and placed it three times as far from the well.

On the suit, a physician of considerable standing testified he considered the privy sufficiently far from the well not to pollute it. On a bare assumption, and because he was a doctor, the jury assumed "he knew."

I now wish to tell you my own experience in the same neighborhood. After reading a few copies of your paper, which came into my possession, I began to talk the question of cesspools, privy vaults and wells with my wife, advising her to boil all the water before drinking, which she would do sometimes and sometimes forget. In fact, it was not practicable anyway, as the children would take cups and go to the pump, but withal, we lived on in that house until one day my wife cut my oldest boy's hair, which is a *beautiful auburn*, but contrary to the usual method of burning the *débris*, she threw it into the cesspool, and the result was, *short red hair in the well water*, of such an unmistakable hue that my wife pronounced it Jack's. I moved. Yours, etc., K.

HEATING A BATHING POOL.

TOPEKA, KAN., *March* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you please inform me, in the next edition of your paper, how I can heat a bathing pool, 84 feet long, containing about 72,000 gallons of water, the size of pipe that would be necessary, and how long you think it would take to heat? also the size of boiler necessary? By so doing you will oblige, A. ANDERSON.

159 Kansas avenue.

[If you wish to warm 72,000 gallons of water, say from 30° to 70° Fahr., it will take the heat of about 2,160 lbs. of steam to do it.

If you wish to do it in an hour from the time steam is turned on, it will be necessary that the boiler should have a heating surface of not less than 800 sq. ft.

If noise is no object when warming the water, a 4-inch steam pipe leading to a 4-inch header, from which about 30 lengths of 1-inch pipe may be run, open at the free ends, but reduced to the size of about a ¼ pipe.

A more expensive apparatus which may be made noiseless, is a somewhat similar coil of 1¼-inch pipe, but closed; the condensed water being pumped back to the boiler, instead of being allowed to mix with the water in the pool, as in the first method. The surface for this coil will have to be a matter of experiment.

At the New York Natatorium, 5th ave. and 45th street, the water is warmed by being circulated directly through the boiler, as in a hot water apparatus, and is the system we would recommend, a boiler of about 300 feet of surface being sufficient, on the assumption the time for first heating the water is no object, say, 3 to 5 hours; after which a slow fire can be made so as to maintain the temperature required.

Of course where the water from the boiler is discharged into the pool, care must be taken that hot current cannot scald anyone; a crib or some such arrangement being required.]

DRAFT IN DOWN SMOKE PIPE.

PHILADELPHIA, *April* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

I recently placed in my residence a fire-place heater, and from it conducted a 6-inch sheet-iron smoke pipe down through the floor and through the cellar to the furnace chimney. The vertical portion of the pipe extended downward 4 feet, and the horizontal portion through the cellar 19 feet, with three one-fourth bends in the cellar and a rise of two inches towards the chimney.

On first lighting the heater, and while there was a fire in the furnace, it burned nicely, but the smoke pipe was nearly cold the entire length.

After abandoning the furnace, and the chimney being cool, I again built a fire in the fire-place heater with hot coal and charcoal; it burned very slowly for three or four hours, then gradually changed for the worse, and died in about nine hours. During most of the time the room was filled with gas.

Digitized by Google

Now, Mr. Editor, I desire to know the best plan for overcoming this difficulty, and still use the down draft when there is no fire in the furnace. As the cellar is cold most of the time, and the pipe runs near the windows, would it not be better to use some other material for smoke pipe—say terra cotta—and cover it with a non-conductor? I think the air in the cellar chills the pipe, thereby cutting off the draft.

Your views on this will greatly oblige

INFORMATION.

[There is always difficulty in starting a fire with a down pipe entering a cold chimney, and unless the escape heat from the fire is sufficient to always maintain a column of air within the chimney lighter than in the down pipe, there will be no upward draft.

The probability is that the furnace chimney is of such a size (too large) that all the escape heat from the fire-place

heater is not sufficient to maintain the required heat within it.

Your idea of preventing a loss of heat in the cellar is theoretically a move in the right direction, but we do not think it will do unless the pipe enters a small, smooth, straight chimney of good height, and then it will be better to cover the sheet-iron pipe with some good steam pipe covering which will stand fire, as it can be more readily supported than terra cotta.]

CIRCULATION BELOW THE BOILER.

Mr. J. T. Armstrong, of Keene, N. H., gives us a description of the manner in which he connected a 100-gallon galvanized boiler, in the Young Ladies' Seminary at Northfield, Mass., where it was necessary to have quite a trap in all three pipes—supply, hot water and circulation. The boiler sits on a small auxiliary heater, and is connected both with that and with the range. It stands in an ell, as shown on plan, while the plumbing fixtures are in a shaft in the main building. The tank stands directly over

this shaft, in fourth story, as seen in the elevation. The supply comes down to under floor of main building, and runs under floor of that building and of the ell, then rises to boiler, which has three couplings on top. The hot water drops immediately from boiler below the floor and after running under ell and main building, ascends the shaft, supplying fixtures on the way, to above bath and slop sink on third floor. Just above the highest faucets the circulation pipe is branched off, and from the junction an expansion pipe, ½-inch, goes above tank. The circulation pipe comes down beside the other two, to under the floor, and rises to coupling on top of boiler, descending into the boiler to about the level of the side coupling to range. Under these conditions, we are informed, the circulation is so good that very hot water is obtained as soon as even the farthest faucet is opened. The fall of the pipes from top of boiler to under side of floor is about 8½ feet; height to where circulation branches, about 30 feet. Hot

water and circulation pipes are ¾-inch lead, 3½ pounds to the foot; the fixtures supplied with hot water are 12 wash trays, three wash basins, three bath tubs, three slop sinks, three china sinks, and one kitchen sink.

HOT WATER RADIATOR.

UTICA, *April* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

In your issue of April 5th, page 415, Mr. J. A. Fish, of St. John, N. B., wants to know of a hot water radiator for use in private dwellings, in place of box coil. In answer I would say I have put in several of the Whittier Radiators. They are well adapted for water circulation to be placed in rooms for direct heating. They are manufactured by the H. B. Smith Company, Westfield, Mass.

Respectfully yours, E. W. STRADLING.

NOTES FROM CINCINNATI.

(From our Special Correspondent.)

CINCINNATI, *April* 12, 1883.

Among the important structures, for the erection of which this summer preparation is being made, is the new Art Museum. It is to be of the Florentine Romanesque style and constructed of limestone, rock faced. It will be 105 feet wide by 210 feet long. Located in Eden Park, upon one of the highest and most picturesque knolls, its natural sanitary advantages are great, being quite above the smoke and vapors of the city. Although the plans have not advanced through all the minutes of sanitary appliances, the mode of ventilation has been decided upon, that is by means of an air well. Were it not that one or two in connection with private dwellings save it from being altogether new, it would be a novelty in Cincinnati. It is to be about sixteen feet in diameter and stand fifteen feet above ground, and at some distance from the building. The trench connecting it with the basement of the building will be twelve by seven feet. The steam coils will be enclosed in chambers thus supplied with fresh air, which from these will be conducted to the various apartments. It will be, so far as as your correspondent can learn, the only public building thus supplied. In its architecture and sanitary appliances our Art Museum is expected to be be a model of high art, and may form the subject of a future letter.

To many other of our buildings it will doubtless afford a wonderful contrast—our "city buildings" for instance. This, with its central station-house, is a positive disgrace, and this is affirmed with a careful avoidance of exaggeration. The plumbing is execrable and of the crudest kind. Off the main lower hall is a water closet, the stench from which pervades the whole building. A keen sense of smell is enabled to detect its ammonia in nearly every quarter of the building. In a room, say, thirty by thirty feet, full of iron cages, are confined the criminals of all grades. The ceiling is just a little way above a tall man's head; imagine this room, with from thirty to sixty persons confined in it over night. A close basement, contiguous, uncleanly water closets pour into it continually their gaseous stench, and the rank air, exhausted of its oxygen, is sickening and oppressive to one entering from the outside. A closed stairway leads up from this pen into the court room. Usually about twenty-five prisoners are brought up at a time, and the vapors which they bring with them are ordinarilly sufficient to poison the atmosphere of the court-room. Time and again your correspondent has seen sensitive persons resort to their handkerchiefs, the lawyers hitch their chairs over to remote corners, and the persecuted reporters unceremoniously take hold of their noses. Save that the city hospital, by virtue of its roomy and spacious construction, may be said to be very well ventilated, there is, perhaps, not a public edifice but is sadly in need of ventilation.

Small-pox has disappeared from Ciucinnati.

Since the flood the sanitary department has been devoting its entire energy to the pumping out and cleaning of flooded cellars, and the work still goes on. The department furnishes pumps and the owners or occupants are required to do the work. The inspection of such a vast number of cellars has let in a flood of light upon what is, undoubtedly, a great source of disease. They have such cellars under hundreds of buildings chiefly occupied below as business houses, which have evidently never been cleaned out since they were constructed, which may be any time from ten years to a quarter of a century, or over. The conclusion seems to be arrived at, that throughout the business districts everywhere, and especially, for several blocks deep along the river front, and in Mill creek bottom, the actually clean cellars are but a small proportion of the whole. As affording an opportunity to compel the cleaning out of cellars, the flood is regarded by the sanitary officers as a blessing in disguise. Some portions of the city, however, are in a bad way, notably the suburb of Cummingsville. It is without drainage, and the soil retains the water like a sponge. So soon as the engines pump out the water, they fill up again, and it will be far into summer before the natural drainage will render the soil normal.

REPORT ON FOOD ADULTERATION AND ILLUMINATING OILS.

The following is the conclusion of the report of Dr. C. F. Chandler, of the Sanitary Committee of the State Board of Health, for 1882. The first part, concerning illuminating oils, was published in our last issue.

II.—FOOD AND DRUGS.

The following work has been accomplished under Chap. 407 of 1881: 194 samples of food had been purchased. Of these 119 have been examined by the public analysts, 50 of which were found to be adulterated, while 69 were pure; 92 samples of drugs have been purchased, of which 75 were analyzed; 32 were found to be adulterated and 43 pure. Tables V. and VI. exhibit the details with regard to these samples.

The Committee further reports that 24 cases have been prepared for prosecution. Complaints have been made, and the sellers of adulterated articles have been arrested and held for trial; 17 persons for selling adulterated cream of tartar, the percentage of adulteration varying from 37 to 95, consisting in all cases of gypsum; 2 cases of adulterated coffee; 4 cases of adulterated mustard. Table IX. exhibits the details of these cases:

PRECIPITATED SULPHUR.

254	George Cutts	508 Third ave.	Dec. 16	A. L. Colby.	Dec. 30	30% su'phate of lime.

One of the defendants, Henry Fulle, was brought to trial before the Court of Special Sessions, on January 8 and 9. The case was vigorously defended, it is understood, at the expense of the wholesale dealers. The retail dealers have generally stated to the representatives of the Board, that it is not their intention to contest the law, that they regard it as for their benefit. The opposition appears to come entirely from the manufacturers and wholesale dealers in adulterated articles. The Court convicted the defendant and imposed a nominal fine of ten dollars, this being the first offence. The case is to be appealed at once.

III.—MILK.

The perishable character of milk makes it necessary that the enforcement of the law against its adulteration should be undertaken by the local boards of health. With a view to calling attention to the importance of this subject, resolutions were adopted at the November meeting of the Board:

(The resolutions have already appeared in our columns).

IV.—WATER.

The Sanitary Committee also reported that during the the past year 10 samples of drinking water have been examined by the Public Analyst, at the request of the local authorities, most of which have been found to be unwholesome. Table X. exhibits this work:

(The length of this table prevents our reprinting it here).

V.—DISTRICTING OF THE STATE.

For the convenience of the Public Analysts, the State has been divided into three districts, as follows:

I.—Southern District: embracing Sullivan, Ulster and Dutchess Counties, and all of the State south of them. The Public Analysts for this, the most populous district, are E. G. Love, Ph.D. and F. Hoffmann, Ph.D., both of New York city.

II.—Northeastern District: embracing Columbia, Greene, Delaware, Broome, Cortland, Madison, Oneida, Lewis and Jefferson Counties, and all that portion of the State north and east of them. The Public Analyst for this district is Willis G. Tucker, Ph.D., of Albany.

III.—Western District: embracing Tioga, Tompkins, Cayuga, Onondaga and Oswego counties, and all that portion of the State west of them. The Public Analyst for this district is S. A. Lattimore, Ph.D., of Rochester.

VI.—CONCLUSION.

In carrying out the provisions of Chapter 407 of 1881 and Chapter 292 of 1882, the Committee finds itself very much embarrassed from want of inspectors. There is only one inspector, A. L. Colby, Ph.B., of New York, for the entire State. His duty involves the purchase of samples of food and drugs and oil, investigating kerosene accidents, making inspections of oil refineries and other manufacturing establishments at Hunters Point, and responding to general calls made upon him by the Sanitary Committee or by the Secretary of the Board. In addition to to this, a considerable amount of time is involved in preparing cases for trial, and in attending Court. With the present litigation in progress in New York City, it seems important that at least an additional inspector be appointed for the other portions of the State. It is desirable that the person purchasing the samples be competent to test them, in order that in making complaint, he can testify, not only to the fact of the purchase, but also to the fact of the adulteration, and thus avoid the necessity of calling Public Analysts from a distance to attend a preliminary hearing.

All of which is respectfully submitted.

C. F. CHANDLER,
Chairman Sanitary Committee.

COUNTRY HOUSES.

We understand that the drains at Wynnstay, the well-known seat of Sir Watkin Wynne, are to be thoroughly overhauled. There seems reason to suppose that the attack of diptheria, to which Miss Necta Williams Wynne, Sir Watkin's youngest daughter, recently fell a victim, was the result of a bad sanitary condition of the house, and that Sir Watkin's own serious and prostrate illness during the winter was partly, at any rate, due to the same cause. This seems to be another instance of the truth of our recent remarks on the sanitary country houses, which we believe, as a rule, to be thoroughly bad. Wynnstay is a comparatively new house, having been erected after the fire in 1858, which destroyed the old mansion.—*Builder.*

GERMAN SANITARY CONGRESS.

The German Society for the Promotion of Public Health will assemble at Berlin from the 16th to the 19th of May. The principal address will be delivered by Prof. Virchow, his subject being, "What Use should be made of the Sewage or Refuse of Cities?" Immediately after the discussion on this paper, the members of the Congress will proceed in a body to visit the estates on which the sewage of Berlin is employed. Another question which will be dealt with by the Congress is the quality of drinking water and water used for domestic purposes, and how to test scientifically whether it is wholesome or deleterious to health.

THE SANITARY COUNCIL OF THE MISSISSIPPI VALLEY.

The fifth annual meeting of the Sanitary Council of the Mississippi Valley took place at Jackson, Mississippi, April 3 and 4. Representatives were present as follows:

Arkansas.—Dr. J. A. Debrel, Secretary State Board of Health.

Illinois.—Drs. B. M. Griffith, J. L. Mellion, Jas. G. Keernan, W. A. Harkins, P. A. Barton, A. Schlernitzaner, members State Board of Health; J. M. Hall, Chicago Health Board; W. H. Doak, Wabash Valley Association.

Indiana.—Dr. H. G. Jones, State Board of Health.

Iowa.—Dr. W. H. Dickinson, State Board of Health.

Louisiana.—Messrs. Adolph Schrieber, Jno. Chaffe, Cotton Exchange; Geo. Purves, Lumber Exchange; T. H. Ryan and Wm. Traynor, City Council; Wm. Smallwood, Produce Exchange; Dr. Wm. Austin, Orleans Parish Medical Society, Ocean Springs and Biloxi, Miss.; Dr. J. M. Watkins, Medical and Surgical Association; W. B. Schmidt, Auxiliary Sanitary Association of New Orleans and Ocean Springs; Drs. W. P. Holliday, Edward Fenner, L. F. Salomon, Auxiliary Sanitary Association; Dr. M. J. Lehman, of *Times-Democrat.*

Missouri.—Drs. Speilgelhalter, Sudelking, of St. Louis Board of Health; W. B. Outten, M. P. & S. W. Railway System.

Ohio.—Dr. Lawrence C. Carr, Cincinnati Medical Society.

Tennessee.—Dr. G. B. Thornton, State Board of Health; John K. Speed, Merchants' Exchange; Sim. L. Barinds, Memphis Cotton Exchange; David P. Hadden, Memphis Board of Health.

Wisconsin.—W. M. Daniels, State Board of Health.

Mississippi.—Dr. F. W. Dancy, President State Board of Health; Dr. Wirt Johnston, Secretary State Board of Health; Drs. B. F. Kittrell, J. M. Taylor, S. V. D. Hill, C. A. Rice, W. F. Hyer, members State Board of Health; Maj. A. M. Paxton, Vicksburg.

The President, Dr. Gustave Devron, of New Orleans, addressed the Council as follows:

The gentlemen who have been previously present at sessions of the Sanitary Council of the Mississippi Valley may recognize in the presence of the present delegation representatives from States and from commercial and other interests not heretofore represented, they having been invited by the executive committee, who in tendering such invitation deemed the present convention of vital importance to all.

The main and sole object of this body is the protection of human life from imported and contagious diseases from any point, and this object is to be attained with the least possible restriction to travel and commerce. New Orleans has been considered the source of pestilence, producing yellow fever, and non-residents as well as residents sustained this view. Non-residents are also under the impression that the city is the source and cause of danger, while the citizens, or a part of them, recognized no necessity for quarantine.

Experience has taught the public at large, as well as the medical profession, that yellow fever does not originate in New Orleans, nor will it even propagate there to any excessive and dangerous extent if that city is kept clean. The experience and labor of the Sanitary Association in preserving the gutters, canals and streets in complete and good condition have proven the above assertions beyond a doubt; and as the merchants of New Orleans are fully aware that the city can never be a large and prosperous commercial metropolis so long as it is supposed to be a centre for the diffusion of yellow fever, they will contribute freely and with open hands funds to the Sanitary Association, and thus continue the good work of keeping the city clean and free from imported disease. Again, though the Board of Health of Louisiana is not represented in this convention, that body has given the visiting delegates from New Orleans every positive assurance that a strict and rigid quarantine shall be established and sustained from May 1 at all ports of entry in the State of Louisiana.

If any case or suspicious case of yellow fever should occur in the city of New Orleans, they have pledged themselves to give immediate, accurate, complete and truthful information of the same to the health authorities of this valley.

In order that this statement may not be taken as the opinion of a member of that Board, a special session will take place this very day, if it was not held within the past twenty-four hours, and resolutions will be passed to this effect, and will be transmitted to this convention before adjournment.

Moreover, if any question or request from this Council be transmitted by telegram to the president or conference committee of the Board of Health of Louisiana, a special meeting will be held and the answer thereto immediately returned, thereby securing a better understanding than can result from the assertion of any delegate from that body, who cannot bind the Board of Health by his representation or acts. The National Board of Health, through its secretary, has informed those interested in its objects, that it yet continues its work of inspection and co-operation with the State and local authorities, but as its time of existence is limited to some time in June, the successor to this organization must be created by the Council, in order that the old shotgun and other unnecessary quarantines be not repeated as they existed previous to the existence of the National Board of Health; and this is a subject of importance for the discussion, consideration and decision of the Sanitary Council of the Mississippi Valley.

The following committee, one from each State, was appointed to formulate such business of the council as may be presented: Drs. Speilgelhalter, Holliday, Carr, Kedzie, Daniels, Thornton, Griffith, Jones and Dickinson.

The following resolutions of the Louisiana State Board of Health were presented to the Council:

WHEREAS, at a conference meeting of several delegations of the medical, commercial and sanitary organizations of New Orleans, held on the 31st ultimo, it was resolved that the State Board of Health of Louisiana reaffirm and set forth its previous declarations in relation to matters connected with the prevention of the introduction of contagious diseases through the maintenance of a rigid quarantine during the summer months; be it therefore

Resolved, That the State Board of Health of Louisiana hereby declares as follows:

1. That it will maintain during the summer months a system of rigid maritime quarantine for the exclusion of contagious diseases, in accordance with the proclamation of the Governor, just issued.

2. That it will give to the boards of health of surrounding States prompt information of the appearance of yellow fever in New Orleans, and in *no manner* (in the future, as in the past) will it tolerate any attempt to conceal or suppress the knowledge of the existence of any cases or suspicious cases of that disease.

3. That it will permit its health records to be examined by any citizen of Louisiana or by any citizen of any other State, located in New Orleans, properly delegated by any kindred organization for the performance of that duty.

4. That the resources of the State Board of Health for quarantine purposes are fully adequate to enable it to guarantee that there will be no interruption to the same.

These resolutions were coldly received, and a determined effort was made to table them, as they were considered only a tardy concession to this council, and it was only by great efforts on the part of the members of the Auxiliary Sanitary Association that they were received and referred to the committee above-mentioned.

At the meeting, on April 4, the following resolutions were reported from the Business Committee, and adopted:

WHEREAS, As it is the sense of the Sanitary Council of the Mississippi Valley that the National Board of Health is the only body which possesses the confidence of the States of the valley, it is therefore recommended that,

First.—A committee be appointed by the President of the Council to petition the President of the United States to place the $100,000 epidemic fund in the hands of the National Board of Health for disbursement in case its use is demanded.

Second.—That in case the National Board of Health is deprived of the power of making inspection of persons and freight, when demanded by local doctors, health certificates issued under the supervision of representatives of the Sanitary Council of the Mississippi Valley shall be accepted as valid by Boards of Health of the Mississippi Valley, provided that said inspection be carried on under the rules and regulations heretofore prescribed by the National Board of Health.

Third.—That the Sanitary Council recommends that the States of the valley make voluntary contributions, to be expended under the Executive Commission of the Council to continue river and rail inspections in the event funds are placed in the hands of the National Board of Health for this purpose.

Fourth.—That the Sanitary Council recommends, for the guidance of health organizations in this valley, the system of inspection, isolation, disinfection and quarantine heretofore adopted by the National Board of Health.

Fifth.—That the communication from the Louisiana State Board of Health be received in the spirit in which it is tendered, and that their co-operation with the Sanitary Council of the Mississippi Valley in protecting the valley from epidemic disease be cordially approved and acknowledged.

In accordance with the resolution President Devron appointed a committee of one from each of the eleven States represented, to petition the President of the United States in reference to placing the necessary funds in the hands of the National Board of Health, to enable that body to continue inspection, or for other services required. The Governors of the respective States will be solicited to indorse the petition.

The following committee, representing eleven States, was appointed to petition the President of the United States: Drs. Debrell, Haskell, Kedzie, Dickenson, Speilgelhalter, Dancy, Jones, Speed, Carr, and Messrs. Fenner, Daniels and Hadden.

The third Wednesday in March, 1884, was selected as the time of the next session, the place to be stated by the Executive Committee.

The following officers were elected: Dr. Wirt Johnson, of Mississippi, president; David P. Hadden, of Memphis, vice-president.

The following resolution was introduced, Dr. P. H. Barton in the chair, and unanimously adopted:

Honor to whom honor is due. The commendable interest of the Auxiliary Sanitary Association, of New Orleans, as manifested by its local work in practical sanitation and its efforts to maintain a high standard of public health in that city since its organization in 1879, as well as to restore confidence in communities outside of New Orleans, having commercial intercourse with it, by the prompt publication of reliable information pertaining to the public health of that city, entitles it to the confidence and moral support of this Council, and the whole Mississippi valley; therefore

Resolved, That this Council, rightly appreciating the objects and efforts of the Auxiliary Sanitary Association in the delicate and responsible duties it has assumed, to preserve the public health, and at the same time maintain the integrity of the business interest of New Orleans and those having commercial relations with it, we hereby pledge our moral support to the Auxiliary Association as its just due, and heartily commend it to the confidence of all having commercial relations with New Orleans.

The Council then adjourned *sine die.*

In connection with the meeting of the Sanitary Council, the Jackson *Clarion* prints a letter from Dr. Charles Smart, Secretary of the National Board of Health, to Dr. J. H. Purnell, Secretary of the Memphis Board of Health, in reply to questions as to the action of the National Board during the yellow fever season. He says that as the Board has the authority and the means to open its stations in aid of State and local boards for the prevention of the introduction and spread of yellow fever, it proposes to do so sometime in May next, to co-operate with the local authorities as heretofore, and to continue the work until its authority shall have expired. If in the meantime the President should come to the assistance of the Board with the epidemic appropriation placed at his disposal (the $100,000 to be used by the President in case of actual or threatened epidemic), the work can be continued until the close of the season of danger; but, should the Board be disappointed in this, its power to aid will cease, and State and local authorities will have to take such action in the case as may seem good to them.

At their meeting in Jackson, the 2d inst., the Mississippi State Board of Health passed the following resolutions:

Resolved, By the Mississippi Board of Health, that the action of the National Board of Health in the past demand the unqualified endorsement of this State Board of Health; be it further

Resolved, That the President of the United States be and is hereby respectfully requested to entrust the expenditure of the contingent epidemic fund of $100,000. to the National Board of Health; be it further

Resolved, That the Secretary be instructed to forward the above preamble and resolutions to the President of the United States, by telegraph.

A STATE BOARD OF HEALTH IN MISSOURI.

The Missouri Legislature has passed a bill creating a State Board of Health. The Board, to be appointed by the Governor, consists of seven persons, to hold their office for seven years, except the first Board appointed, four of which shall hold for two years and three for four years. At least five members shall be physicians and graduates of respectable medical colleges, and shall have been residents of the State at least five years preceding their appointment. There shall be no discrimination between different schools of medicine. The Board shall have general supervision over the sanitary interests of the State, and may establish quarantine against infected cities or districts. The bill also requires the registration of physicians, and its details resemble the present Illinois law.

THE SANITARY IMPROVEMENT OF PARIS.

M. Oustry, the Prefect of the Seine, has submitted to the Municipal Council of Paris, a report prepared by M. Alphand, Chief of the Engineering Department, relative to the work which should be done to place Paris in a satisfactory condition from a sanitary point of view.

The first point insisted on by M. Alphand is a large increase in the water supply, which he wishes to be 400 litres (105 gallons) per head per day; and his estimate for aqueduct pumps and pipes for this purpose is 50 millions of francs. The estimate for the improvement of the sewers is 28 millions of francs, to which must be added 12 millions for sewage irrigation works.

In forwarding this report, the Prefect urges the necessity of completing the sanitary improvement of Paris with the least possible delay; of enlarging the water supply, completing a system of sewers, and improving the public buildings. He lays special stress on the need for improving the sanitary condition of the schools, and submits the following estimates of the sums required for immediate use:

Digitized by Google

For enlarging water supply and improving sewerage, 90,000,000 fr.
For construction and repairs of buildings..... 10,000,000 fr.
For construction and improvement of schools..... 25,000,000 fr.

Making a total of 125 millions of francs, or about 25 millions of dollars.

If this programme is honestly and intelligently carried out Paris will resume her ancient supremacy as the most attractive capital of Eurpoe, a supremacy with the water famines, foul odors, and typhoid fever prevalence of the last two or three years have done much to destroy.

E. G. LOVE, Ph.D., *Gas Examiner.*

CUT-OFF FOR ELECTRIC LIGHT ENGINES.

We represent this week the variable cut-off motion of the Armington-Sims Co.'s steam engine for dynamos, maufactured for the Edison Electric Light Company. They claim that with this engine they have been able to secure better results than with anything they have hitherto tried. They further say that with throttling engines the governors do not respond promptly enough to give them the result desired, the trouble being aggravated by the fact of the uniform speed required for dynamos. To illustrate, if the variation of the speed of the engine is 15 per cent. for only 2 or 3 seconds at a time, though making only a difference of 3 or less revolutions per minute, should the average speed be 100, for ordinary purposes it might not be perceptible, but should a dynamo be attached and speeded to 1,000 revolutions per minute, the speed for one second of time may be increased from 16.6 revolutions to over 19, giving an irregular intensity to the light.

When the Elecric Light Company cannot have the dynamos run by such engines they prefer to take power from engines which are driving a constant and steady load, as in cotton mills, and as the power used by the dynamos is only a small percentage of the whole, the throwing off or on of a part of their machines makes no perceptible difference in the speed of the engine.

But this would never do in a place where the engine is liable to sudden and extreme change of load. The principle of the Armington-Sims engine is to change the travel of the valve without changing the lead by a centrifugal governor attached to the shaft, which operates an eccentric ring between the eccentric strap and the fixed eccentric on the shaft. The annexed diagrams show the details of construction.

Electric light engines require a minium of steam clearance; the steam contained between a throttling governor in the steam pipe and the piston chest being no inconsiderable factor towards irregularity.

ELECTRIC LIGHT NOTES.

Nashville papers report that the Brush Company are about introducing secondary batteries, and Swan lamps for domestic lighting in that city.

The Capital City Electrical Manufacturing Company, of Columbus, O., to manufacture electrical apparatus of all kinds, is to be incorporated this week.

The Board of Alderman have passed the resolution permitting the New York Electric Lines Company, to lay wires in the street, over the Mayor's veto.

The Railway Telephone Company filed a certificate at Albany, last week. Incorporators, Charles A. Randall and Philip Quackenboss, of this State, and Andrew E. Smytheand Edward K. Hyndman, of Pennsylvania. Objects of the company are to buy and construct lines of electric telegraph within and beyond the limits of this State and throughout the United States and the adjacent countries, especially for conveying telephonic messages for railway purposes.

Meter-ites.

The Gas-Light Company, of St. Louis, reduced their price from $2.50 to $1.50 per 1,000 cubic feet, last week.

The Rochester gas companies have agreed to furnish gas for heating and cooking, cheaper than for lighting.

Some of the leading business houses of this city have united to form a Gas Reform Association, to secure meter inspection by an inspector appointed by the Mayor.

The production of lamp black has been introduced at Saxton Station, Pa., in connection with the nataral gas well at that place. The gas is brought from the well in a main pipe, then distributed through branch pipes to 20,000 jets, which burn in contact with sheet iron plates. The product is 250 pounds daily.

At the meeting of the Engineers' Club, of Philadelphia, March 17, 1883, Mr. Chas. A. Ashburner read a paper on "A New Method of Estimating the Contents of Highly Plicated Coal beds as Applied to the Anthracite Fields of Pennsylvania." The questions of the future production and ultimate exhaustion of these fields, are of the greatest importance. In 1860 the population of the United States was 31,443,321, and 8.513,123 tons of coal were produced, *i. e.*, actually shipped to market; in 1870, the population had increased 22 per cent. (38,558,371) and the production of anthracite was nearly doubled, being 16,182,191 tons. For the year 1880, with a population of over 50 millions, the product was 23,437,252+tons. In 1882 the actual production was over 30,000,000 tons. It has been variously estimated that the 470 square miles containing this coal in Pennsylvania, will be entirely exhausted in from 140 to 204 years. While Mr. Ashburner does not estimate the ultimate exhaustion, he has devised a method for estimating the contents of these fields, from data now being obtained by the careful and practical geological and mining examinations of the State Survey. The exact position and detailed structural shape of the coal beds are first mapped by 50 feet contour lines along the floor of the beds, giving, completely and satisfactorily, their geometrical construction and shape. These surfaces are then developed into planes, by the development into straight lines of the line of the bed as cut by paralleled section planes 1,600 feet apart. This graphical method is attended with errors which are mathematically discussed, and which have been formulated by Mr. Arthur Winslow, Member of the Club. A practical test has been made of this method in the Panther Creek basin, between Mauch Chunk and Tamaqua, and the maximum possible error in estimating the surface area of the coal beds was found to be .905 of 1 per cent. After the areas are thus found, the contents are obtained by careful measurements made in the mines to ascertain the actual number of tons of coal which are contained in a unit (1 acre) of bed area. In this way it has been estimated that the above basin originally contained 1,032,000,000+tons; that the area under development originally contained 92,000,000+tons, out of which latter area 54,000,000+tons have been taken.

The weaving room of the Canada cotton mill at Cornwall, Ont., was visited last week by gentlemen connected with the Edison companies to inspect the system of lighting. Two dynamos supply 426 Edison lamps illuminating the large building, 500 feet by 120 feet.

The following figures concerning the illuminating gases of this city, are taken from the report of the Gas Examiner for the quarter ending March 31, 1883.

	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
Average Illuminating Power for the Quarter	24.97	18.66	21.42	27.26	29.47	18.99
Sulphur, grs. in 100 cubic feet.	3.37	12.55	19.45	7.36	3.97	22.03
Ammonia, grs. in 100 cubic feet.....	0.18	4.21	1.34	0.04	0 03	17.47
Specific Gravities.....	.617 to .642	.422 to .426	.551 to .559	.718 to .729	.650 to .658	.418 to .423

Construction Notes.

SAN FRANCISCO, CAL.—C. L. Crisman has received the contracts for constructing the sewer under Washington street wharf, giving bonds in the sum of $2,500.

BROOKLYN, N. Y.—The contract for laying the new Eastern District water main has been awarded to J. P. Crawford, the lowest bidder, for $35,226.36.

COLUMBUS, O.—The County Commissioners have decided that the bonds issued by them, April 7, for the construction of the Mill and State street bridges are illegal, and they have cancelled the contract entered into by them with Messrs. Preston, Kean & Co., of Chicago, Illinois.

Digitized by Google

UTICA, N. Y.—A bill passed the New York Senate, the 10th inst., authorizing the Superintendent of Public Works to construct, at a cost not exceeding $10,000, a lift or drawbridge over the Erie Canal.

NIAGARA RIVER.—The contract for the new bridge of the Canada Southern Railway over the Niagara river, has been let to the Central Bridge Company of Buffalo.

CINCINNATI, O.—The State Senate, on the 11th inst., passed the bill authorizing the Water Works' Trustees of Cincinnati to issue $6,119,000 of bonds for improvements, and to let out the pumping into the reservoirs by contract. The fate of the bill in the lower house is regarded doubtful.

PHILADELPHIA.—The contract for paving on Richmond, Norris, Front and Chestnut streets, and Grand avenue, has been awarded to Michael O'Rourke, at $14,971.20.

SAN FRANCISCO.—The Committee of the Board of Supervisors have reported in favor of granting W. G. Long and J. D. Divoll the right to lay down water pipes, requiring the work to be done in accordance with all municipal regulations, and requiring the grantees to keep the streets in good condition whenever the pipes are laid.

ALBANY, N. Y.—The Common Council are discussing improvements in the water supply and receiving suggestions from citizens in general. This is very well as far as it goes, and is generally the way that the public have to be educated up to any large work. When all the amateurs and schemers have had their say, and have gotten things hopelessly muddled, the matter is put into the hands of men of experience and skill, and some practical project is developed.

WILMINGTON, DEL.—A bill was introduced into the State Legislature the 4th inst., which provides that water rates shall be fixed at prices that shall produce revenue sufficient at least to pay the interest on the water bonds and the running expenses of the water works, but no house having only a single hydrant shall be charged for the same more than $5 per annum.

The Wilmington, Del., water works supplied during the month of March, 1883, 119,379,520 gallons, as against 139,520,895 gallons pumped in March, 1882, a decrease of 14½ per cent, It is not stated whether any special measures have been taken to suppress waste.

Jersey City made a contract with Patrick Sheehan to clean the streets at $18,000 a year, and sold horses and carts belonging to the city. Sheehan found he had estimated the cost too low, and now the Legislature has, on his application, passed a bill nulifying the contract, and the streets are in a filthy condition.

A company has been formed to utilize the water power of the Androscoggin River at Rumford in Maine, where there is a fall of 162 feet in a mile. This magnificent water power has never been improved, mainly in consequence of its being off all lines of transportation. But railroads are now building which will make it accessible, and the lakes at the head of the river are to be operated as storage reservoirs for ensuring a supply in dry seasons.

The project for cutting a ship canal across Cape Cod has been revived again and a new company is applying to the Massachusetts Legislature for a charter.

The Boston *Sunday Herald* is opposed to *cheap men* in the Water Department, and says, very sensibly, that what is needed in the head of that Department is "the highest grade of scientific ability, combined with practical experience and administrative power, and, in order to obtain a person who possesses these qualifications, the city must be willing to enter the market, and hold out inducements quite as favorable as those which would be proffered by individuals or private corporations.

The Cincinnati *Commercial Gazette* very wisely advocates the creation of a State Commission for the investigation of methods of preventing the pollution of water courses by the refuse of manufactories and the sewage of towns.

An ordinance has been introduced in Philadelphia Councils, authorizing the Mayor to obtain from the American Society of Civil Engineers, the Engineer Corps of the United States Army and the Franklin Institute, the names of six engineers, to make a report of the most durable and best pavement that can be devised by them for the streets, particular regard being had to its healthfulness, economy, smoothness, durability and drainage, and estimating the probable cost of a better system.

The Massachusetts House Committee on Manufactures have reported a bill to establish a uniform standard hose coupling through the State, to be known as the Roxbury coupling, the male coupling to be 2½ inches internal diameter, from shoulder to washer seat one-inch, with seven threads to the inch, V shape, slightly flattened, horn band, 3⅞ inches in diameter; female coupling, swivel, 3⅛ inches in diameter outside, to have a clear water way of 2⅛ inches. No other coupling shall be used in the fire departments of cities and towns under penalty of $50, but this law shall not apply to couplings now in use.

The boring of the artesian well at Ocean Grove, N. J., which was to furnish supply of water, has been stopped. A depth of 175 feet was reached.

The Union Pacific Railroad is stated by the *Salt Lake Tribune*, to have bored a number of artesian wells along its line, with very successful results. Several are in the Bitter Creek Country, the most desolate on the line of the road, and noted for bad water, alkali and poverty of everything good. At Harper the boring is 400 feet deep; at Rawlins, 400 feet, the last 100 feet through granite; at Thayer, 900 feet; at Fillmore, 400 feet; at Table Rock, 1,450 feet through soft rock, and yielding poor water; at Red Desert, 760 feet; at Rock Springs a well 800 feet deep yielded poor water, and the company run water trains to supply the population of 1,500, mostly miners. On the Oregon Short Line, in the lava plains, where there was no water for 80 miles, between American Falls, and Wood River, a well has been drilled 18 miles from American Falls, striking a good supply of water 250 feet below the surface.

The Royal Commission appointed in June, 1882, to enquire into, and report upon, the system under which sewage is discharged into the Thames by the Metropolitan Board of Works, whether any evil effects result therefrom, and in that case what measures can be applied for remedying or preventing the same, has been taking voluminous evidence of both a popular, and a scientific character. Every class interested in or affected by the present system has been heard, and the commission is now receiving the reply of the Metropolitan Board of Works. The resulting Blue Book will be of great interest and value.

OIL REFINERY NUISANCES.

A conference of New York and New Jersey health officers was held at the Astor House, this city, on Saturday last, to discuss the best methods of concerted action for suppressing the nuisances arising from the petroleum refineries along the Kill von Kull, in the city of Bayone, N. J., opposite the villages of New Brighton and West New Brighton, Staten Island. The recent report of the New York State Board of Health to the Attorney-General, on this subject, is noticed in another column.

Among those present at the conference were the following: Dr. Elisha Harris, Secretary of the New York State Board of Health, Hon. Erastus Brooks and Dr. J. Savage Delevan, special committee on effluvium nuisances; Dr. E. M. Hunt, Secretary, and Prof. Albert R. Leeds, of the Council of Analysts, representatives of the New Jersey State Board of Health; Dr. McNeil, representative of the Hudson County (N. J.) Board of Health; Dr. Brush, representative of the Bayonne City Board of Health; Messrs. Stewart and L. W. Clark, representatives of the Staten Island petitioners for the abatement of the nuisances; and the inspectors employed by the New York State Board to make the examinations referred to in the abovementioned report, viz.: Mr. A. L. Colby, regular inspector of the New York State Board, Mr. Arthur Hollick, Inspector of the New York City Board of Health and Dr. Theodore Walser, Health Officer of Castleton, Staten Island.

Inspector Hollick reported the results of a re-inspection he had just made to ascertain whether the suggestions of the inspectors were being carried out. He reported the Standard Oil Company as hard at work doing all that was recommended; the Seaboard Refinery was also making the necessary changes; the French Oil Works had made only the recommended changes in the sewer, and the Ocean Refinery had done absolutely nothing. The discussion on the best mode of action was participated in by Drs. Harris, Hunt, McNeil and Brush, and Messrs. Brooks, Leeds, Stewart and Clark. Drs. Hunt and McNeil explained that legal powers were not vested in the New Jersey Board of Health, as in the New York Board, and that the proper method of legal action was through the Chancellor. Dr. Hunt related the circumstances of the case of a sludge acid factory at Elizabeth. The Chancellor was appealed to by a party of citizens and appointed a committee of experts with power; they took the control of the factory into their hands, running it when they wished to make experiments, and finally closed it permanently. It was stated that no other State had such direct and effective means of legal redress in the case of nuisances as New Jersey. Mr. Brooks moved that the local Board of Health of Bayonne and the Board of Hudson County apply to the Chancellor, at their discretion, for injunction against such works as continued to create nuisances. This motion was carried as the unanimous sentiment of the meeting.

Dr. Walser gave a vivid description of the effects produced by the sludge acid and other refuse matter from these Bayonne refineries, washed up on the Staten Island shores. He described the nuisance as really intolerable; comfort was impossible; people were actually made sick by the odors; the best people were moving away solely on this account; he would not live there himself if he could get away. Other business was transacted, and the meeting closed with a resolution of thanks offered by Dr. Delevan, on behalf of the New York Board, to the representatives of the several New Jersey Boards for their presence and counsel.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

At the meeting of April 4, 1883, the following candidates were elected as members: Thomas Appleton, Council Grove, Kan.; O. H. P. Cornell, Schenectady, N, Y.; G. H. Elliott, Norfolk, Va.; Orville Grove, Houston, Tex.; W. G. Williamson, Martinsville, Va. As juniors: F. L. Fuller, Boston, Mass.; H. McDonald, Nashville, Tenn. The preliminary arrangements were reported by the secretary, for the convention to be held at the cities of St. Paul and Minneapolis, Minn. The party will arrive at St. Paul about noon on June 19. It is intended also to arrange for a visit to the National Exposition of Railway Appliances, at Chicago, before proceeding to St. Paul. The death of Mr. Peter Cooper, on the morning of the meeting, was announced, and after remarks by Mr. Macdonald, it was ordered that an appropriate notice should be spread upon the minutes of the society. A paper by G. Y. Wisner, M. Am. Soc., C. E., on Geodetic Field Work, was read by the secretary, in the absence of the author, and was discussed by Messrs Haight, Prindle, Coes, and Geo. L. Greene, Jr.

COMPARATIVE EFFICIENCY OF NON-CONDUCTING COVERINGS FOR BOILERS AND STEAM PIPES.

In a paper read before the North of England Institute of Mining and Mechanical Engineers, by W. J. Bird, the following conclusions are drawn.

However good may be the non-conducting qualities of silicate cotton (mineral wool), it has always suffered from the drawback that it is of little advantage as regards durability, unless it is encased in iron, wood, straw, board or canvas, which increases its cost. It is advised that it should be applied in the form of a cement or composition which shall be self-adherent, and that will not destroy its porosity or impair its non-conducting value. Jones' silicate cotton cement, an attempt in this direction, not giving good results, while Dode's silicate cotton composition, which is self-sustaining, gives good results.

He gives a table from which may be observed the increase of efficiency obtained by increasing the thickness of coverings. Doubling the thickness of course means double the cost, whereas from average results it appears that if the thickness of the covering is doubled the non-conducting efficiency is increased only in the ratio of 1 to 1.16 or 16 per cent. Hence it may be concluded that the most essential requisite in a good covering is that it should possess a high non-conducting efficiency with a moderate thickness.

STEEL WATER PIPES.

The Chameroy Company make pipes of steel plate for conveying water under high pressure. The steel plates are coated with lead on both sides by immersion or otherwise, then rolled to form, riveted, and soldered the whole length, and covered with pitch. The first cost of the steel is not much greater than that of iron, and the steel pipes possess considerable advantages over those of iron. The lead coating is superior on account of the fineness of grain in the steel; the resistance to tensile strain and internal pressure is fifty to sixty times, and the resistance to deformation longitudinally from thirty to forty times greater, while the superior elasticity of the steel plate permits of the the pipes receiving tolerably hard knocks without being permanently deformed. For equal thickness the steel tubes stand twice the internal pressure of the iron, and being both light and strong, they are admirably adapted for laying down temporarily and taking up again.—*Iron.*

BALTIMORE PLUMBERS.

The Master Plumbers of Baltimore held a meeting at Rain's Hall, on the evening of the 12th inst., and elected a temporary President and Secretary, and agreed to form a permanent association. A committee of five was appointed to draft a constitution and by-laws for the government of the same. The committee was instructed to report at a meeting to be held on the 19th inst.

The Journeymen Plumbers are also going to form a permanent association, and will hold a meeting on Monday evening, the 16th inst., to effect that object.

A CORRECTION.

Our attention has been called to an error in the data relating to meters, etc., in Providence, R. I., printed on page 362, issue of March 22, 1883, which should read 7.6 miles of pipe supplied with water, lying outside of the city limits, instead of 76 miles, as printed.

GOVERNMENT WORK.

Abstract of bids opened April 11, 1882, for iron work for the Washington Monument, by Lt.-Col. Eng., Thos. L. Casey: Phœnix Iron Co., of Philadelphia, $12,-044.93; J. B. & J. M. Cornell, of New York City, $11,-984; Phœnix Iron Co., of Trenton, N. J., $10,275. The award will not be made for several days.

BOOKS RECEIVED.

We have received from Mr. C. F. Hancock, the SUPPLEMENT to his REPORT ON THE DRAINAGE QUESTION, presented to the Hendon, Eng., Local Board, Nov. 25, 1882.

We have received from Mr. C. S. Parsons, of the Engineer's Department, THE ANUAL REPORT OF THE CITY ENGINEER OF BOSTON, FOR THE YEAR 1882.

FIRST ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF INDIANA, for the fiscal year ending October 31, 1882.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

WASHINGTON, D. C., *April* 10, 1883.

M. C. MEIGS,
Supv'g Arch't, New Pension Building.

TRENTON.—Governor Ludlow has signed the bill, amending the law passed last year, providing for the appointment of commissioners to determine upon plans for storing any water of the State for furnishing joint supply to cities.

The Chicago *Times* states that the early construction of a bridge across the Missouri river near Kansas City, for the Burlington and South Western branch of the Chicago, Burlington and Quincy R.R., is probable. A charter was obtained at the last session of Congress. Soundings have been made, and drawings for the bridge are in course of preparation.

The Light-house Board is making arrangements for constructing a light-house at Fourteen Foot Bank, Delaware Bay. There is available an appropriation of $175,000.

ILLINOIS.—A bill has been introduced in the Illinois legislature empowering the State Board of Agriculture to offer $5,000 in prizes for the improvement of roads and highways.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an Urban population of 5,605,357 there died during the week ending April 7, 2,686 persons, which is equivalent to an annual death rate of 24.9 per 1,000, an increase on the preceding week, for which it was 23.2.

For the North Atlantic cities the rate was 25.0; for the Eastern cities 27.9; for the lake cities 20.4; for the river cities 18.5; and in the Southern cities for the whites 23.7, and for the colored 41.8 per 1,000.

Consumption caused 13.8 per cent of all deaths. In the North Atlantic cities it caused 16.4; in the Eastern cities 14.6; in the lake cities 9.4; in the river cities 12.2; among the Southern whites 12.0 and among the Southern colored 19.8 per cent.

Diphtheria caused 3.1 per cent of all deaths. In the North Atlantic cities it caused 1.8; in the Eastern cities 3.4; in the lake cities 4.4; in the river cities 3.2 and in Southern cities among the whites 1.6 per cent. It seems therefore to be increasing in Eastern cities and diminishing in those of the lake region.

Typhoid fever caused 1.8 per cent of all deaths. In the North Atlantic cities it caused 3.9 per cent being especially prevalent in Boston and Providence.

Scarlet fever caused 3.1 per cent. of all deaths. In the North Atlantic cities it caused 2.4; in the Eastern cities 3.5; in the lake cities 3.4; in the river cities 2.8; and in the Southern cities among the whites 4.8 per cent.

Pneumonia caused 13, and bronchitis 4.5 per cent. of all deaths. In the North Atlantic cities pneumonia caused 14.9; in the Eastern cities 14.1; in the lake cities 9.6; in the river cities 14.2; and in the Southern cities, among the whites 11.2 and among the colored 10.2 per cent of all deaths.

BOSTON, MASS.—C. E Davis, Jr., reports 14 new cases of diphtheria, 29 of scarlet fever and one of typhoid fever during the week.

DETROIT, MICH.—Dr. O. W. Wight reports 26 new cases of scarlet fever and 24 of diphtheria.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 31 new cases of

scarlet fever and eight of diphtheria, making a total of 13 of the latter disease and 58 of the former under treatment.

New York City Lunatic Asylum, Blackwell's Island.—Dr. T. M. Franklin reports 16 admissions, nine discharges and three deaths during the week; remaining under treatment, 1,344.

Richmond, Va.—In his report for the week Dr. J. G. Cabell states that a recent census, not quite completed, makes the population 70,684.

San Jose, Cal.—In his report for the month of March Dr. C. W. Breyfogle records a death from chloroform administered for the performance of a surgical operation on a boy fourteen years of age.

San Francisco, Cal.—During the week ending March 23 there were 101 deaths from all causes. The deaths under five years numbered 19. Accident caused three, cerebrospinal meningitis one, consumption 16, diarrhœal diseases one, diphtheria one, erysipelas one, typhoid fever two, scarlet fever one, pneumonia 12 and acute bronchitis four.

New Orleans.—The Board of Health report for the week ending March 31 did not reach us in time for entry in our table. The deaths numbered 188; white 95, colored 93, corresponding to death rates per annum of 43.73 for the whole population; 30.19 for the whites and 80.67 for the colored. Under five years, white 19, colored 20. Among the white people small-pox caused 20 deaths, scarlet fever two, malarial fever four, diphtheria one, consumption 15, bronchitis two, pneumonia 13, diarrhœal diseases three, and violence two. Among the colored people small-pox caused 49 deaths, typhoid fever one, malarial fevers four, erysipelas one, consumption four, bronchitis two, pneumonia six, and violence two.

During the three months from January 1 to April 1, there were 428 deaths from small-pox in New Orleans; 144 whites and 284 colored. In the same time deaths from all diseases footed up 1,977; 1,150 whites and 827 colored. In this same time the deaths, white and colored, from phthisis pulmonalis were 227. It will be seen that there were double the number of deaths from small-pox among the colored people than there were among the whites, although the whites outnumber the colored nearly three to one. During the entire year of 1882 the total deaths from small-pox in New Orleans were 415; whites 116, colored 299.

Michigan.—Dr. H. B. Baker's report for the week ending March 31 shows the following diseases as prevalent: bronchitis, consumption, neuralgia, rheumatism, influenza, intermittent fever, tonsilitis and pneumonia. Diphtheria was reported present at 14 places, and scarlet fever and measles each at 17 places.

Baltimore, Md.—The return from this city for the week ending April 7, shows a total mortality of 201; males 114, females 87; under five years 72, over 60 years 28. The annual rate per 1,000 during the week based on the estimation of the population by the local authorities was for the whole population 25.55, for the white 21.45 and for the colored 49.40. Among the white people consumption caused 21 deaths, malarial, typhoid and puerperal fevers one each, bronchitis two, pleurisy one, pneumonia 11, small-pox three, and violence two. Among the colored people consumption caused nine deaths, croup five, diphtheria nine, erysipelas one, scarlet fever seven, bronchitis seven, measles one, cerebrospinal meningitis two, pneumonia 13, small-pox eight and violence four.

Nashville, Tenn.—The city health officer, Dr. Cheatham, reports from Feb. 13, to March 13, 44 new cases of small-pox, 25 of which were sent to hospital and 19 isolated at their homes; of the former seven and of the latter eight terminated fatally.

During the same period the county health officer, Dr. Mitchell, reports 55 admissions to the county small-pox hospital, there being 42 cases on hand on Feb. 13. Of the total 37 have been discharged, 13 have died, 20 are convalescent, 10 are suspects and 17 in bed under treatment. Three of the cases were second attacks, each being well pitted from the former sickness. One of these died, a second recovered, and the remaining case is still under treatment.

Providence, R. I.—D. E. M. Snow, Superintendent of Health, says, in commenting on the mortality of the week ending April 7: "The total deaths numbered 65, representing an annual rate of 28.95 in each 1,000 of the population of the city. This number was 22 more than the weekly average for last year. There seems to be no special explanation in the causes of death last week of this increase in the number. The number from typhoid fever and from pneumonia was slightly greater; but the number from some other causes was less. The sudden increase must be considered accidental, and probably will not continue."

With regard to the recent recurrence of typhoid fever, which gave 48 new cases during the eight days from the 20th to the 27th of March, Dr. Snow remarks: "It is probable that the disease has reached and passed its height, and is now on the decline; and that as the weather grows warmer it will cease. There is nothing in the facts thus far that would justify any panic on the subject; nothing that would warrant the exaggerated statements that have been made of the prevalence of the disease in certain portions of the city; nothing that confirms the theories so persistently promulgated, of the cause or causes of the disease. It is certainly the duty of every good citizen to endeavor to allay rather than to increase excitement upon such a subject, and it is a gross outrage upon the community to make statements in regard to the cause of the disease which, if true, would and should create a panic, unless there is absolutely certain proof of their truth. We would conceal no truth, but would not draw hasty and dangerous conclusions from uncertain facts."

The case of small-pox recently treated in this city cost $91.66, and the city was reimbursed to the extent of $16.00, by the U. S. Government. Dr. Snow, in a letter to the Board of Aldermen, says: "In this case the patient was a sailor, who paid hospital money to the Government, and should have been supported in his sickness wholly by the Government; but the Government collects hospital money from all alike, and then, in Providence at least, makes no provision whatever for the support of those who are so unfortunate as to be taken sick with any contagious disease. This fact is highly discreditable, and it is possible that an appeal to the proper authority might bring a remedy."

Connecticut.—The report of the Secretary of the State Board of Health for the month of February shows acute diseases of the lungs as taking the leading place among the causes of death. Scarlet fever, while subsiding in the cities first attacked, is extending into other parts of the State, except in the southwestern part, where measles and whooping cough prevail. Winter cholera has been reported from some of the cities. Dr. Chamberlain adverts to the connection between foul air and pneumonia: "Persons coming out of ill-ventilated rooms, after breathing polluted air which has already induced some congestion of the lungs by its irritating qualities, readily take cold, and a congestion which induces inflammation is easily excited. It is well known that there is a type of pneumonia induced by foul, polluted air, even without subsequent exposure to the colder air out-of doors. Sewer gases from bad plumbing or imperfect drains, contaminated air from polluted soil around the house, by heaps of decaying filth or saturation by kitchen or other refuse, if drawn into the house or habitually breathed, so depress the system and lower vitality that disease is readily engrafted. During the prevalence of the present type of broncho-pneumonia, a severe cold should receive attention at all sacrifices. Neglect to care for what at first was apparently a trifling ailment, has caused the sacrifice of many valuable lives."

Ontario, Canada.—The *Provincial Bulletin* for the week ending March 31, shows a very large increase in the degree of prevalence of measles. This disease has increased to 10 per cent. of the total cases of disease reported. The little regard paid to its presence in a family makes this a centre from which it is spread rapidly in every direction. The retrogression of other diseases, such as scarlet fever and diphtheria, is noted. Bronchitis and influenza are prominent diseases.

Demerara, British Guiana.—Consul Philip Figyelmesy transmits reports from Georgetown and New Amsterdam for the month of January:

Georgetown.—There were 148 births; males 76, females 72: and 208 deaths, of which 95 occurred in hospitals and other public institutions; three in Colony Craft and River, while 37 were deaths of infants under one year, leaving 67 as occurring among persons of one year and upwards in the city. Twenty-nine of the deaths were caused by diarrhœa, five by dysentery, ten by malarial fevers, one by typhoid fever, one by erysipelas, three by leprosy, 25 by consumption, one by bronchitis, one by pleurisy, two by pneumonia, and five by violence. Population 47,175.

New Amsterdam.—Births 20; males 13, females 7. Deaths 39; quinsy, whooping cough, diarrhœa and dysentery each caused one death, malarial fevers two, and consumption two. Population 8,124.

Buenos Ayres, Argentine Republic.—Consul E. L. Baker reports a mortality of 835 as having occurred during the month of January, in a population of 300,000. Small-pox caused 152 of the deaths, and the disease is reported on the increase.

Scotland.—Consul J. A. Leonard sends the report of the Registrar-General for the week ending March 24. The death-rate in the eight principal towns was equal to 28.4 per annum per 1,000 of the estimated population. This rate is 5.9 above that for the corresponding week of last year, but 0.4 below that for the previous week of the present year. The lowest mortality was recorded in Aberdeen, viz., 1.24, and the highest in Glasgow, viz., 36.2. The most fatal miasmatic diseases were whooping cough and measles in Glasgow, and whooping cough in Dundee.

Digitized by Google

Edinburgh.—Total deaths 79; no deaths are registered from small-pox, measles or fever; diphtheria caused three deaths, whooping cough three, scarlet fever one, diarrhœa one, acute diseases of the lungs 14, and violence three.

PARIS, FRANCE.—There were 1,316 deaths during the week ending March 21, as compared with 1,209 in the previous week; males 741, females 575; under five years 349, over 60 years 317. Annual rate, 30.53. Tyhpoid fever caused 39 deaths, small-pox nine, measles 25, scarlet fever one, whooping cough nine, croup and diphtheria 43, erysipelas three, puerperal infection one, consumption 306, acute bronchitis 54, pneumonia 128, and violence 32. The rise in the mortality rate is mainly due to consumption and pneumonia. So high a total from consumption has never before been recorded in the *Paris Bulletin*. On March 18, there remained in the hospitals 97 cases of small-pox, 275 of typhoid fever, and 48 of diphtheria.

RHEIMS, FRANCE.—Consul John L. Frisbie reports 68 deaths during the week ending March 17, equal to an annual rate of 37.68; males 41, females 27, under five years 29, over 60 years 16. No death is reported from violence, measles, puerperal fever, scarlet fever, typhoid fever or diarrhœal diseases. Whooping cough caused one death, croup and diphtheria four, erysipelas one, small-pox one, bronchitis and pneumonia 14, and consumption seven.

BRUSSELS, BELGIUM.—During the week ending March 17, there were 279 births, and 240 deaths in the city and its *faubourgs*, corresponding respectively to the annual rates of 34.7 and 30.5. Deaths under five years 114. Small-pox, measles and croup caused four deaths each, scarlet fever and typhoid fever two each, diphtheria none, whooping cough six, diarrhœa and dysentery 23, bronchitis and pneumonia 49, and consumption 30.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 92 deaths during the week ending March 10; males 51, females 41; under five years 41, over 60 years 30. No death was occasioned by small-pox, whooping cough or typhoid fever. Measles caused 10 deaths, scarlet fever four, peurperal fever one, croup and diphtheria four, diarrhœa seven, consumption 11, pneumonia 14, bronchitis three, and violence two.

The following cases of disease were reported during the week ending March 17: measles 40, scarlet fever 19, typhus three, typhoid fever 2, erysipelas two, puerperal fever none, whooping cough nine, diphtheria nine, croup one, diarrhœa 25, tonsilitis 10, pneumonia 11, pleurisy two, and acute bronchitis 82.

COPENHAGEN, DENMARK.—There were 134 deaths during the week ending March 13; under five years 56, over 60 years 38. No death was registered from small-pox or measles. Scarlet fever caused one death, diphtheria two, croup two, whooping cough four, typhoid fever two, diarrhœa three, erysipelas one, puerperal fever one, consumption 18, pneumonia six, bronchitis 14, and violence one.

During the week the physicians reported cases as follows: Small-pox none, measles one, scarlet fever 23, diphtheria five, croup one, whooping cough 96, typhoid fever five, dysentery one, diarrhœa 67, erysipelas 26, puerperal fever one, bronchial catarrh 399, pneumonia 67 and tonsilitis 128.

ST. PETERRBURG, RUSSIA.—Consul-General Stanton reports 753 deaths for the week ending March 10; males 440, females 313; under five years 335, over 60 years 88; population 929,525. Thirteen deaths occurred from small-pox and 40 from fevers. There remained under treatment in the city hospitals on March 11 1,204 cases of fever, 61 of small-pox and 1,132 of several diseases.

Dr. E. R. Hawn, late Secretary of State of Indiana, has been elected Secretary of the Board of Health of that State, in place of Dr. T. M. Stevens.

The Montreal Board of Health advocates compulsory vaccination for all children in the city.

A pie made from canned grapes is believed to have poisoned five persons in West Bloomfield, Ont., recently. The grapes have been sent to Prof. Lattimore for examination.

The Ohio Senate has passed the bill dividing Cleveland into sewerage districts.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels*.

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

MISCELLANEOUS.

ALBANY, N. Y.—A bill has been introduced in the Senate appropriating $125,000 for the building of a Normal school

CHICAGO, ILL.—H. Siercks, architect, has plans for a four-story and basement building, corner of Michigan and La Salle streets, to be used as a leather house. Mr. W. C. Lobenstein is the owner. Mr. Siercks has also completed the designs for a block of six houses for Mr. M. G. Reithel, on Hoyne avenue, near Lexington, to cost $30,000.

LOUISVILLE, KY.—A union depot will be built on Main, between Fifth and Sixth streets, by a syndicate of which Mr. J. Gould is chief. It will cost $400,000....The Lighthouse Board have accepted plans for the erection of new lighthouses at Mosquito Inlet and Cape San Blas. The amount and appropriations available for the first is $60,000, and for the second $35,000.

MEMPHIS, TENN.—Mr. John Reed has the contract for constructing a marine hospital to cost $38,775.

TROY, N. Y.—Edward Kelley has the contract for a three-story brick house for Mr. William Walsh, on North Third street near Vanderheyden, to cost $5,000; and for two brick dwellings of two stories each, for Mrs. Catharine Noonan, on South street near Eighth; to be built at a joint cost of $5,000.

TOLEDO.—Mr. Bacon has plans for a residence, to be erected on Collingwood avenue, by Mr. S. S. Laskey. It is to be of brick, two stories and basement, with modern conveniences. It will cost $15,000 ...On the corner of Nineteenth and Washington streets, Mr. S. H. Morgan will erect two dwellings, after the plans drawn by N. B. Bacon. They will be two-story frames, and will cost $6,000....Alexander Webber will construct a dwelling on Erie street, between Locust and Lagrange, two stories and basement, from plans by Bacon; to cost $7,000 ...N. B. Bacon is completing plans for the front of a three-story brick block, to be erected by Mr. Tracy, Sr., on the site adjoining Eaton's. It will be used for stores when completed, and be ready in July....The brick block to be erected by E. D. Potter, Jr., on Berry street, will be three stories high, and cost $15,000....The building to be erected by M. A. Scott, on Adams street, was planned by N. B. Bacon. It is to be of brick, two stories high with basement. It will have appliances for the bottling business and will cost $8,000....An imposing structure is to be built by Calvin Bronson, on the corner of Summit and Adams streets. E. O. Fallis is the architect. It is to be of brick, cut stone trimmed; four stories high, and completed by September 1....Mr. Sam. Fisk will erect a block of three dwellings at the corner of Seventeenth and Monroe streets. They were planned by E. O. Fallis; will cost $9,000, and will be finished by September 1....A double dwelling is to be erected on Twelfth street, near Adams, by A. M. Woodson and H. B. Tillinghast, from a design by Fallis. To be built of brick, at a cost of $6,000....The Toledo, Cincinnati and St. Louis Railroad Company contemplate the construction of 500 feet of docks, a grain elevator, and other improvements, to be completed the 1st of September. In the Fifth Ward, Mr. Rathburn Fuller is building a residence, in Queen Anne style, on Monroe street, to be completed in June, costing $7,000. H. J. Platfoot & Co. are the builders....The residence of Clarence Brown, on Collingwood avenue, will cost $5,000, and be ready in June. H. J. Platfoot & Co. are the builders ...The residence of J. G. Kaney, on Warren street, near Woodruff, is nearing completion. It is in Queen Anne style, of brick and cut stone trimmed, with modern conveniences, and will cost $7,000....The Burnett House is to be enlarged by an addition four stories high, to be built of brick, with cut stone trimmings. The other portions of the hotel will be remodeled to correspond with it, at a total cost of $17,000. The work will be completed August 1.

WILMINGTON, DELAWARE.—Messrs. J. Newlin and Alfred Gawthrop are preparing to build themselves a handsome edifice for stores, at the southwest corner of Fourth and Shipley streets. It will be two stories in height, built of brick, trimmed with Ohio stone. When finished it will cost $29,000, and be a credit to the architect, E. W. Thorne. J. R. D. Seeds & Son will probably receive the contract for building. The Messrs. Gawthrop are building the foundation and cellar themselves.

1883 IMPROVED 1883

Automatic Beer Pump.

Responsible and Energetic Plumbers can largely add to their busines by acting as agents and erecting these pumps.

Send for circulars.

HYDRO-PNEUMATIC PUMP CO.,

E. F. AMES, General Agent.

302 East 23d Street, New York.

THE KITCHEN BOILER

AND WATER PIPES.

A few words on their Arrangement and Management; more especially their treatment during Frost, and how to avoid Explosions. By H. Grimshaw, F. C. S., late Demonstrator in the Laboratory of the Owens College, Manchester. Price, 40 cts.

For sale by Book Department, The Sanitary Engineer, 140 William Street, New York. P. O. Box 3037.

J. A. DEAN & CO.

Manufacturers of

LINSEED OIL and LINSEED CAKE,

NEW DIRECT ACTING

STEAM PUMPS.

For Every Imaginable Service.

A large number of these Pumps have been put on every variety of service during the past three years, with the best results.

The Pump is simple in construction, having a smaller number of moving parts than others.

It will work equally well under a light or heavy pressure, at a higher speed, with less noise than any other steam pump, and is suited for every variety of sevice.

All Pumps are tested at the factory under all possible speeds and pressures.

We are prepared at present to furnish all the leading sizes, and are constantly making additions to our patterns.

Send for price lists and discounts to the

HOLLY MANUF'G COMPANY, Lockport, N. Y.,

Or C. G. HILDRETH, Secretary,

P. O. Box 1,372. *157 Broadway, New York City.*

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

BENNOK'S

Syphon Trap.

The only Brass Trap in the market.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

Agents wanted. *17 North 9th St., Philadelphia, Pa.*

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. .I

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves

Digitized by Google

The accompanying illustration shows the manner in which one of the ROYAL PORCELAIN BATHS was fitted up in the private residence of a gentleman in New York City. The entire floor and surrounding walls were tiled and the Bath was placed sufficiently far from the wall to permit washing every portion of the intervening space. The only wood work used in connection with it was the top rail. In this instance the Bath was lifted from the floor and supported by brass flanges as shown.

These Baths have also been placed in rooms in a hospital in the same manner with the exception that the tubs were set on a floor of flagging and the supply and emptying cocks were placed below the floor, the rods simply running through. The wooden capping, however, was omitted.

Persons living in a house worth over $15,000 should certainly have these Baths, and to be appreciated they should be seen.

It should be borne in mind that the "THE ROYAL PORCELAIN BATH" has been made by one firm exclusively for 27 years, and during all that time they have met all the requirements of a first-class bath.

"IMPERIAL" PORCELAIN BATHS.

For Private use (two sizes). No. A, 5 feet 6 inches long, No. B, 5 feet long

"IMPERIAL" PORCELAIN BATHS.

For Hospital and Asylum use (two sizes). No. A, 5 feet 6 inches long, No. B, 5 feet long.

The "IMPERIAL" Porcelain Bath, moulded and glazed in one piece, is without doubt *the finest piece of ware that has yet been produced of the size*, perfectly modelled, delicate and uniform in color, with a glaze which is simply wonderful on so large an article as a Bath Tub. From both a sanitary and economical point of view these Porcelain Baths recommend themselves; they are non-absorbent, will never wear out and entail no labor scouring or burnishing, requiring only to be wiped out with a sponge to be made perfectly clean. As regards the fixtures we have only to say, they are manufactured by ourselves in the very best manner, being made entirely of Brass, with nothing to break or get out of order. An important feature in the Fixtures is the McFarland Waste, which, for simplicity, durability and cleanliness is unexcelled. It will also be noticed that the fittings are complete in themselves, requiring no extra overflow pipe or other pieces.

The Baths for Asylums are fitted so that the supply and waste handles can be enclosed and only accessible to the janitor or party in charge. The value of these baths for hospital use cannot be over-estimated, forming as they do a most important adjunct in the treatment of skin and other diseases.

*NOTE.—*Occasionally we have on hand a few Tubs with slight defects, which for use in hospitals or asylums are absolutely as good as the perfect Tubs, and which we will sell at a reduced price.*

THE UNITED STATES GOING INTO THE STREET CLEANING AND GARBAGE BUSINESS.

The New Orleans *Picayune*, of April 11, contains a long dispatch from Pensacola, from which it appears that an agreement has been entered into between the Board of Health of that city and Dr. Hamilton, the Surgeon General of the Marine Hospital Service, by which assistance is to be given to Pensacola, to effect and maintain the sanitation of the city, on the following terms:

"First in the payment of bills, for the removal of garbage during the months of May, June, July, August, September and October. The garbage shall be systematically collected and removed from every house and building or inclosure, under a contract made by the Board of Health, the contractors to give bonds satisfactory to the Board for the faithful performance of the work, and providing for liquidated damages, in case of failure.

"The bills for work done under these contracts to be certified by the Acting Assistant Surgeon of the Marine Hospital Service at this station, and the President or Secretary of the Board of Health. Contracts to be made for temporary drainage, and for the cleaning up of the principal streets. The drains to be opened, gutters made under the direction of the City Engineer and approved by the Board of Health. * * * The work to be paid for under like restrictions as under other contracts.

"All requisitions of the Board of Health to be forwarded through the representative of the Marine Hospital Service at this station."

It will be seen from this, that the Treasury Department proposes to enter on a new field of operations, and that of almost boundless extent. No doubt a large number of cities and villages, north, south, east and west, will be glad to have the United States pay their bills for removal of garbage, street cleaning, drainage and sewerage.

Under what law this contract to clean up Pensacola has been made we do not know, but we hope that its provisions are not going to be applied to that city alone; for if such should prove to be the case, it will be a matter requiring a good deal of explanation on the part of the Treasury Department.

THE RAMAPO PROJECT.

Two weeks ago we alluded to a plan proposed for bringing fifty millions of gallons of water daily to New York from the Ramapo River in Rockland County, and based our comments on the scheme on the proposition that the supply thus proposed was to be considered as a substitute for that recommended by the Chief and consulting engineers of the Department of Public Works.

The project has since assumed a different shape. It is now claimed that it is not intended to prevent the construction of the new Croton River Aqueduct, but only to furnish a moderate amount of water, about fifty per cent. of the present supply, but to furnish that in a much less time than it will take to build the Croton Aqueduct, and to deliver it at the city limits at such an elevation that it will furnish a means of protection against fires without the intervention of steam fire engines.

This places the matter on a different footing, and, in fact, presents the project in an attractive form to the gentlemen who have endorsed it.

The situation may be summed up as follows:

The underwriters and dry goods merchants want and demand a fire service for the protection of the dry goods district, so-called, said service to be provided at the earliest practicable moment, and to secure a constant pressure of water of at least one hundred pounds to the square inch, in order that stand pipes on the various buildings may be ready for any emergency, and that streams may be thrown directly from hydrants over the highest buildings without the aid of fire engines.

The committees from these interests endorse this Ramapo scheme, as presented to them by the engineer employed by its projectors.

They have been told, and evidently believe, that responsible capitalists stand ready to invest their money to carry it out, under conditions named in the bill elsewhere printed, and which they presume will be for the interest of the city to accept, yet not one of the chairmen of the various committees knows the name of a single one of these capitalists. They dread a devastating conflagration, since many of the buildings in this district are too high to be within reach of the present fire extinguishing facilities, and none of them are fire-proof; they are unable to secure adequate insurance on their stocks of valuable merchandise, and such as they have obtained might, in the event of a large fire, be valueless, since the insurance companies are likely to be bankrupted.

These gentlemen do not oppose the Croton scheme for general purposes, but on account of the time needed for its completion, and the fact that the head will not be above the level of the Central Park Reservoir. They want the Ramapo supply as an auxiliary, and they believe that project is put forward in good faith, is feasible, and can be carried out at reasonable cost, and within two years.

Digitized by Google

It is, therefore, proper to consider the proposition in its various aspects, to see if the anticipations of these gentlemen have sufficient basis in fact, to offer a reasonable chance of realization. The reports which have been made on the subject heretofore do not appear to have been made by experts acting judicially, but rather by engineers acting as advocates. They bear to "the whole truth" the same relation that the evidence elicited by a competent lawyer from his own witness does. It is all true, no doubt; but there has been no cross examination to show how near to falsehood strict veracity can approach.

We wish to be understood as acknowledging the eminence in his profession of the only distinguished engineer who has appeared in advocacy of the scheme.

The proposition of the projectors of the Ramapo scheme—and it may be incidentally remarked that the names of its financial backers have never yet been made public—is to deliver a certain amount of water at the northerly boundary of the city, and to receive from the city for each million of gallons a price not to exceed the present cost of the same quantity of Croton water. This is apparently a fair proposition. It might be rather difficult, we imagine, for the contracting parties to agree on what the cost of delivering fifty millions of Croton water is. The city authorities might fairly claim that the repairs and maintenance of the aqueduct and dams outside of the city represents the cost of delivery of the water. This amounted in 1882 to $70,082, for 95,000,000 gallons a day, and therefore 50,000,000 gallons a day ought to be delivered for about $35,000, or the interest on $700,000 at 5 per cent. But the contractors might claim that as the city was paying $1,000,000 annually as interest on the Water Works debt, that one-half of that sum, or $500,000 per annum, should be paid them in addition to the $35,000. There would here be a good chance for honest difference of opinion, and consequent delay in furnishing water. The trouble recently experienced in San Francisco, over the settlement of the accounts between the water company and the city, is an illustration of the difficulty of adjusting such accounts.

Supposing the contract made, however, there should be some assurance of the ability of the contractors to deliver their water, since time is the important element in the consideration of this question of fire protection. The legislature would undoubtedly grant the company the power to condemn land and water rights under the right of eminent domain, so far as the State of New York is concerned. But the natural flow of the water from the 125 square miles of watershed draining into the Ramapo River in New York, is through the State of New Jersey. That State has a permanent commission, the duty of which is to guard the waters of the State, and the legislature has recently explicitly authorized and directed that commission to begin proceedings in the Supreme Court of the United States, in the name of the State of New Jersey, against any adjoining State which may attempt to divert water from the streams which enter and flow through New Jersey.

Litigation in the United States Courts on so important a question as this, would doubtless consume a great deal of time, and delay the advent of the Ramapo water.

But supposing the water delivered at the city line, there will be needed to make it available for fire protection of the buildings on Broadway alone, the laying of 16 miles of 30-inch pipe, which would take about 17,000 tons of cast iron and cost $1,000,000. This is the backbone only of the system of fire protection, for the Merchants' Committee of Fifteen demand that all the buildings in the present "Dry Goods District" should be connected with the separate fire mains. This would involve the tearing up of all these streets and the laying of about 12 miles of pipe. This, with the hydrants and branches, would cost another million of dollars, and if done within one year would cause great inconvenience.

To judge of the annoyance which would be caused by laying an independent set of mains through the business part of the city, we must bear in mind that the steam heating companies have laid only 14 miles of pipes altogether, and the fire protection of the business part of the city below Houston street would oblige the laying of at least 60 miles of pipe. To do this in two years would be very difficult and cause great interference with travel and traffic. It would, therefore, be interesting to know if it is proposed to lay these mains at once, or after the proposed supply is brought to the city limits.

The time assured for the completion of the Ramapo Works we believe to be ridiculously inadequate. The work contemplated is the construction of eight stone dams at the outlet of lakes, three earth dams, respectively ten, thirty and fifty feet high, 31 miles of aqueduct, of a design never, so far as we are aware, successfully put into use, and two lines of cast iron pipes, each a mile long, sunk at the bottom of the Hudson River.

It is not our purpose to assert that the engineering difficulties are insurmountable, but we do assert that they are sufficiently great to require that the pecuniary rewards held out must be large in order to secure the investment of the necessary capital to insure the delivery of the water at Mount St. Vincent.

As for the claims made of the superior quality of the water to that derived from the Croton, they are silly. They sound well and may be useful in arousing a sentiment, but they are untrue. The population of the upper part of the Croton watershed, over twice the available area of the Ramapo, is no greater to the square mile, and the soil is as rugged and favorable to purity of the water.

The advantages of the project may be allowed to be (1) independence of source, (2) practicability of a fire service. Its questionable points are (1) lack of responsible backers who are willing to give their names; (2) doubt of the legal possibility of its being carried out; (3) hazardous methods of construction; (4) excessive cost, the water delivered being claimed to cost $6,000,000 for 50 million gallons per day. At the same rate, the new Croton dam and aqueduct, which will deliver 250,000,000 gallons per day, would cost $30,000,000, which is twice the greatest estimate of its projectors.

In view of the considerations here suggested, and others that the limits of this article forbid our mentioning, we should want the Treanor bill so amended that the Sinking Fund Commission shall not be limited to the consideration and negotiation of this particular scheme, but empowered to employ their own experts to suggest a scheme for fire protection, on which they can obtain opinions from disinterested experts and have carried out as they deem best. We have no desire to retard the execution of any reasonable, practicable plan that will secure prompt fire protection for the dry goods district that we are satisfied is put forward in good faith, but we are unwilling to endorse any scheme the backers of which keep themselves so carefully out of sight. Since the entire amount of water consumed for fire extinguishing purposes was only 47,418,250 gallons during 1882, about one-half of one day's supply, and since special fire mains must be laid with any high service scheme, it might be well to have the opinion of experts as to the feasibility of keeping water in these special mains under sufficient pressure to offer the Fire Department all the relief they want so far as water is concerned, and yet not use salt water, or cross the river for a supply either.

The questions for immediate consideration, it strikes us, are—

First. Shall this city go to the expense of putting down a system of special fire mains from which water for no other purpose is to be drawn, and if so, to what extent? and

Second. Cannot a constant pressure of 100 pounds per square inch be maintained in such mains at less expense than by the purchase from private parties of futures in water?

HEATING AND VENTILATING A PRISON.

The accompanying diagrams illustrate the principles of the warming and ventilating of the New York State Reformatory at Elmira, N. Y.

Figure 2 is a cross section of one of the wings of the building, showing a "cell block," of which there are four, with the arrangement of the air passages and course of the air from the time it enters fresh at the window *a*, until it escapes through the exhaust chamber *c*. Figure 1 is the detail of the radiators, which present some novel features.

In prisons the problem of efficiently warming and ventilating is complicated by the necessity of providing for the safe keeping of the inmates, and calls for methods not ordinarily met with and of unusual strength.

The heaters are round, vertical tube radiators set under the windows, with openings in the centre of the bases. In corresponding openings in the stone flags are set strong cast iron pipes *t*, with flanges built into the masonry. These pipes extend up through the openings in the bases of the radiators which they fit closely, connecting the fresh air ducts with the radiators and preventing water (when washing the floors) from entering the ducts. The upper end of the pipe *t* is also fitted with a strong plate *f*, which acts as a baffle to the entering air, forcing it between the tubes of the heater, and also acts as a cover to the pipe, so that nothing large can be passed through it.

FIGURE 1.

The number of concentric rows of tubes in the radiators is four. The two outer rows are separated from the inner ones by a galvanized sheet iron partition or septum *r*, the object being to divide the inside rows from the outer ones so as to make part of each radiator practically an indirect heater, the air from the duct only coming in contact with the inner rows, while the outer rows warm the air already within the halls and give direct radiation.

The galvanized sheet iron partition is simply a sheet of No. 20 iron, bent and riveted at the edge and slipped into place, and may be done with any round radiator, making what is called a "direct-indirect-radiator."

It is claimed that the short shaft or flue formed by this simple device accelerates the movement of the air to a very considerable degree, and prevents the possibility of the air being drawn down into the duct by preventing a reversal of the movement of the air in the towers.

With radiators arranged this way, we are informed, marble tops are not as good as cast iron fretwork, as the former hinders the easy ascent of the current of air; and we believe for all purposes the marble top does not give quite as high an efficiency for the same reason.

There are 500 cells, each of which have two 4x4 inch flues, one from near the ceiling and the other from a cast-iron niche near the floor. The one near the ceiling is fitted with a heavy cast-iron frame built into the walls, while the lower one connects with the top of the "night-bucket" niche. The flues are separate their whole

Digitized by Google

ength, each terminating in the exhaust chamber as shown, and there is no means of closing them.

The exhaust chambers extend the whole length of the blocks of cells, so that the flues are perfectly straight, a person in the chamber being able to see the light in the cells.

The steam coils within the exhaust chambers are 1¼-inch pipes and extend over the upper ends of all the flues.

The air ducts extend all around the wings near the outer walls as shown, and communicate with the fresh air shafts or towers, each tower having a separate section of duct.

The course of the fresh air is in at the window and down through the tower, thence through the air ducts to the radiators, through which it passes to the halls, from which it is drawn into the cells by the action of the independent flues, thence out through the aspirator.

FIGURE 2.

The coils in the aspirator or exhaust chamber are not connected with the regular heating system of steam pipes, but with a special system provided for them, with the valves in the boiler room, so that they can be under the control of the engineer without his entering the buildings, and also to admit of using the exhaust chamber and coils during the summer and when steam is not otherwise required, which is done, causing a rapid movement at all seasons.

We are informed that when the air is moved sufficiently often to give each cell one-half a cubic foot of air per second, the difference of temperature between the upper galleries and the flag is only five degrees in the coldest weather.

The system of steam pipes is "gravity-return," and the pressure is increased or decreased to suit the weather.

The boilers are ordinary horizontal tubular, five in number, 16 feet long by 4 feet in diameter. Two, and sometimes three, are used on the heating apparatus, and one for cooking, drying, etc., while one is always in reserve.

We are indebted to Z. R. Brockway, General Superintendent of the prison, under whose supervision the institution was built, for the drawing of the building.

THE SEWERAGE OF BINGHAMTON.

The following is the reply of Mr Rudolph Hering, C.E., to the strictures which Col. George E. Waring made on the plan proposed by the former for the sewerage of Binghamton, which we published in our last issue:

To the Honorable Common Council of the City of Binghamton, N. Y.:

GENTLEMEN—I have recently received, in pamphlet form, a letter written by Colonel George E. Waring, Jr., to the Citizens' Committee of your city, for which he had prepared a report on a system of sewerage for Binghamton, about the same time that I submittted a similar report to you. In this letter he comments on my recommendations.

Unwillingly I send you a reply to it, because an apparent controversy of this kind might possibly lead you to infer that there was still a serious doubt as to the proper methods of sewerage. But as he states that the system I have submitted to you, and which you have adopted, is "very crude, imperfect and unsatisfactory," my duty to you, as well as to myself, demands this communication.

I can probably justify my recommendations in no better way than to compare them with those offered by him to the Citizens' Committee, which will, I think, assure you that this statement has no foundation.

On the day that I submitted my plan and report, I was shown the plan of Colonel Waring, which had been presented a short time before. I felt some astonishment on seeing it, as I had expected one that was much better digested. Among the main lines, he had drawn several, naturally suggesting themselves at first, which after a more careful inquiry were found less desirable than others not so apparent at once. It was precisely a study of this kind which I supposed you expected of a consulting engineer, instead of a scheme of alignment, which would later be found less advantageous.

You will find, for instance, that the drainage of the northern part of the city can be better accomplished by carrying the sewage eastward to Liberty street than westward to the canal. You will also find the location of the First Ward main sewer, as I give it, to be less expensive, and to give a better point of discharge than Col. Waring's route. The reasons which decided in my mind with regard to the selection of these lines are given in my report.

But I was still more surprised when seeing a prominent, curved line indicating the boundary of Col. Waring's plan. It encloses only the higher areas, from which very readily all sewage and rain water could run away to the river, and excludes, by curving around them, the lower areas, which present the only difficulties in this respect to be met in your city. They are within the populated districts, and, as you know, give you much more trouble than the high grounds. In these places, which form natural pockets, the rain and waste water produce small ponds in wet weather, and at other times deposits of stagnating sewage. The depression on Pine street is even well built up, and inhabited by the poorer classes, needing drainage as much as, if not more, than the inhabitants of the high ground.

Nearly all of the time I consumed in studying up my plan was devoted to these very difficulties, which to you were most important, and which Colonel Waring has not solved, while he has shown you only how the sewage will flow from the higher territory down to the rivers.

Further, he would have you abandon most of the sewers already built, and construct new ones on the same streets and about of the same depth, for the conveyance of sewage only. In my plan all existing sewers that are in a good condition have been worked into the system to the best advantage.

I was, therefore, impressed with a feeling which Colonel Waring has expressed in words with reference to my plan, namely, that his project was certainly "very crude, imperfect and unsatisfactory."

He says nothing in his letter about the above, and other essential points, but confines himself almost wholly to generalities, to which I will next refer.

From the summer of 1880 to that of 1881, I was engaged in studying the features of the sewerage works of Europe for the National Board of Health, Washington. My instructions were to carefully examine and report on facts, and the time I spent on this work allowed of a very thorough inquiry, the importance of which I fully realized. The Memphis works had just been finished. Claims were being urged for and against them. I had no preference for nor interest in any particular system, further than to find out which, if any, was the best.

The results of my labors are embodied in a lengthy report to that Board, and the general conclusion, which very clearly impressed itself upon my mind, was that no one system was *per se* the best, and that the locality should govern the selection, as most of the systems in use were good under specific conditions.

Had the locality of your city made it apparent that Colonel Waring's patented claims were the best, I should not have hesitated in the least to recommend them to you, with perhaps some modifications. But I am convinced that they are not the best, and would even be less useful and satisfactory in your town than in most of the towns I have recently reported for, and in none of which I found occasion to recommend his patents.

A main feature of his system is the absolute exclusion of rain-water. I stated fully in my report, page 3, the reasons for admitting some roof-water in all cases, to which I must again refer. To further justify this point, I will add the following:

Baldwin Latham, in his standard work on Sanitary Engineering, says, page 42 (Ed. 1878, or three years before the issue of Waring's patent): "Some persons propose that in every district the rainfall should be entirely separated from the sewers; but, unfortunately, the persons who make this proposition have had, as a rule, a very limited experience as to the effects of rainfall on sewers." He says further, page 299: "The admittance of rainfall is of considerable value as a flushing agent."

This is about the opinion held by the most prominent municipal and sewerage engineers, as I found it expressed during my extended visit abroad, and as it is expressed also in our own country. At the last annual meeting of the Association of Municipal and Sanitary Engineers of England, in the summer of 1882, in the president's address we read: "A theory more opposed to the first principles of sanitation (the absolute exclusion of rain-water from a public sewer) I can hardly conceive of; for strongly as I am in favor of that which we know as the separate system, * * * * I know of nothing which tends more to the purificationof the immense quantities of lateral drains * * * * * than the heavy flush of rain, which dealing with drains over which the local surveyor has no control, carries on a purifying process which no mechanical flushing can by any

Digitized by Google

possibility produce." In the discussion which followed, this opinion was generally endorsed. One speaker stated: "I was exceedingly pleased to find that he (the president) gave very good reasons for a single (combined) system of sewers to a certain extent." It was further said: "The growing tendency of modern times, principally in the south of England, is to the separate system—absolute as far as possible. I believe that those having practical duties to carry out as town surveyors, will agree that the value of rain-water in cleansing the drains is very great, and should not be thrown away."

Robert Rawlinson, Chief Engineer of the Local Government Board, and highest English authority on sewerage matters, in a letter to THE SANITARY ENGINEER, New York, April 27, 1882, "insists on the removal of roof water" as being beneficial for the sewers.

You see, therefore, that my recommendation to admit some roof water is supported by excellent authority; in fact, more weighty authority of its kind does not exist. On the other hand, the Memphis system has been in use hardly three years. In has already required the introduction of a number of man and lamp-holes for the purpose of cleaning, and already some of the mains are running at times up to their full capacity. Had the mains been made larger, and the means for access been placed in a manner, as a long English experience shows advisable, the system would have been still more satisfactory.

A regulation of the amount of rain water entering the sewers is not a difficult thing, and no such evil effects as Colonel Waring mentions will occur under ordinary careful control.

If it is said that we have less frequent rainfalls here than in England, and, therefore, can less depend on their flushing, I must reply that this changes their value in degree only not in fact. Additional artificial flushing is necessary in England; it would also be necessary in our country, and perhaps to some greater extent.

I must here refer to the case which Colonel Waring had calculated for a small district in New York in a way which might tend somewhat to mislead. Had he not left out the cost of excavation, back filling and repaving, the example would look differently. At a low estimate these items would cost 75 cents per foot, for each plan, "not considering the extra cost of the wider trenches for the larger pipes," which would be a trifle, if there was any difference at all. This gives the cost of sewers, excluding roof and yard water, to be about $3,120, and including it about $4,600, as against $900 and $2,377 respectively, the figures given by him.

While in the latter case it might appear that it costs about 163 per cent. more, in reality the reception of roof and yard water would cost only 47 per cent. more. Further, he calculates a greater roof and yard area than I have done in your case, because New York is built up more densely, which fact would likewise tend to mislead. The entire quantity of roof and yard water is beneficial, mainly at the highest part of the sewer, and of the drainage area; lower down much of it could as well run off in the gutters. As a matter of fact the saving of expense by excluding the roof water in a city like yours would be less than 25 per cent. the cost required to include it.

But you would lose the advantages of the inhabitants freeing their yards and the sidewalks of much ice in winter and of much rain water in summer. In a rural section of Cleveland, Ohio, sewers were built solely for the purpose of carrying away rain water from the lots, showing that this advantage is deemed to be worth considerable expense.

You would further deprive the sewers of a large amount of clean water for flushing. And I might add here that, on account of the simultaneous entrance of the rain water over the entire system, the *mains* are flushed by a much greater quantity than is ever possible by the dissimultaneous action of flush tanks alone.

The somewhat larger pipes, finally, will allow for extraordinary demands, as well as for temporary expansion of the district, and decrease the danger of serious stoppages.

All these advantages are gained to property owners and the city, for the additional expense of but a few dollars per average lot at the time of building the sewers. Virtually, however, there is no such additional expense in the system I have recommended to you, because by building also *separate* channels for rain water removal in the "Waring" system, the total cost to the city would be no less, but rather more, both for construction and maintenence, than for single sewers. When Colonel Waring says that my "system is very costly," wishing you to infer that his costs much less, you can now perhaps readily see the weight of his assertion.

Another main feature of his system is the placing of automatic flush tanks at the head of every sewer. He says, page 12: "Even if we admit the full benefit gained (of receiving roof water for flushing), what shall we say of the condition of such sewers depending on this means of flushing alone?" leading you to infer that I have provided for no other means of cleansing. I distinctly recommend, page 10 of my report, the use of automatic flush tanks at dead ends, where the flow is slight, as I have always done before in other cities.

A third feature of his system is a sub-soil drainage. You will find that I have recommended the same method (page 10).

A fourth feature is the ventilation of the sewers through private houses. This I could only advise if the control of the house sewers is placed in the hands of competent persons under municipal control, but not if householders and plumbers alone have sole charge of them, (page 10, second column), as there would be great danger of sewer air getting into the rooms.

These four points are the main claims of Col. Waring's patent, which has the date of January 18, 1881. He leads you to suppose that they were all or in part new, and that their use subjected you to the payment of a royalty.

The idea of an absolute exclusion of rain water is old. It had been carried out before, where it was thought advisable. Robert Rawlinson says, page 16 of his "Suggestions," 1878, adopted by most of the English towns: "Where sewage requires to be pumped, it will be advisable to exclude surface water." Baldwin Latham says, page 50 of the work above quoted: "When sewage is intended to be treated (purified before entering a small water course), rainfall should be excluded as far as possible. In some foreign countries in which there are distinct periods of wet and drought, it may always be desirable to convey away the excessive storm water by a distinct set of sewers, while the sewage proper may be conveyed away by another set of sewers." The city of Oxford has had for five or six years a small district in which no rain whatever enters its sewers.

From this fact and the above quotations you will see that it is not so much the "English law" that prevents exclusion of rain-water, which could be changed by the Local Government Board, if it were necessary, but the opinion of engineers that it is advisable only under specia conditions.

In Germany the entire exclusion has been recommended for a part of Elberfeld and Barmen. But even in our own country, the town of Pullman, Ill., has a complete system of sewers into which no rain-water enters. Colonel Waring can therefore claim no royalty for this feature alone.

The idea of placing automatic flush tanks at the heads of sewers is also old and has been used for several years. Bailey Denton, in his large work on Sanitary Engineering, 1877, says, page 201 and others: "At the head of all sewers there should be some means provided for admitting water, either from the public water-main or from a tank built purposely to collect the rainfall and retain it for use in flushi g during dry weather;" "Field's flush tank may be used for this purpose;" "By the use of tanks of this character the rain water from the roofs may also be turned to account for flushing, and as it is only when the tank becomes full that its contents are discharged, the slightest showers are made to contribute."

Baldwin Latham, in the text book before quoted, 1878, says, page 293: "For flushing the heads of sewers, tanks are usually provided, the contents of which are periodically discharged by means of a self-acting syphon, a plug or valve." He further says: "When used for this purpose (flushing 'either large or small' sewers), the *annular form of Field's syphon* is generally desirable," which is the same one embodied in Waring's patent, dated three years later.

But also in our own country automatic flush tanks have been recommended prior to 1881. In Pullman there is one at the head of every branch.

Also the claim of combining a sub-soil drainage with sewerage is old. Several European cities have done this in part years ago. And as to the ventilation of the sewers through house pipes, I will state that this has been for many years the common custom in Germany, where house drainage was directly under municipal control.

I shall now refer to some special points gathered from Col. Waring's letter.

He passes over the question of rain water removal lightly, as though it were simple and inexpensive, while in reality it is quite a troublesome feature. These "few channels," which he admits will be required for this purpose, can hardly be less in number and size than those I have provided for in my plan, as I have not advised its underground removal, except at such points where its surface flow will become objectionable, which applies equally to both systems. The difference is, that I have embodied the rain water removal in mine, while he has made no design for it.

He claims that catch-basins would be an "intolerable nuisance in paved streets," from which "much horse manure and other filth" is deposited in them. If this were true, and it can only be the case under bad management, whereas it is not true in cities under even a tolerably good one, the same argument would apply to the shallow channels which he advises for the removal of street water alone, and into which the same surface filth would be washed and deposited. Such rain water channels I occasionally found in Europe to be no less foul than sewers.

When he continues to say that the attention and labor required to keep them clean will be as "nothing" compared with what would be demanded by those contained in my plan, he contradicts English experience.

In asserting the opinion that short curves within manholes for pipe sewers, and long curves for large sewers, do not respectively offer the greatest advantages, he stands in opposition to the emphatic assertions to the contrary made by and insisted upon by the best English engineers and others, even under conditions of a regular flushing of sewers.

Baldwin Latham says, in his text book, page 163: "The system of laying sewers in straight lines, with man-holes, lamp-holes, or ventilators at every point of change in direction, and which is so great an improvement on the old system of laying sewers in crooked (curved) lines, is due to the ingenuity and forethought of Mr. Robert Rawlinson, C. B., Chief Engineer of the Local Government Board."

Colonel Waring asserts further that sewers receiving rain-water together with sewage are always foul, and that such sewers are "never" as good on sanitary grounds as two separate sewers.

My examination of sewers did not prove this to me. On the contrary, the best systems in Europe and the cleanest sewers I saw happened to be of the "combined" class; and in the cities where they were properly designed, the death rate was lower than before sewers were introduced.

I must emphatically differ with him as to the correctness of the statement, that the storm water overflows into the rivers would be "seriously objectionable," because during the first part of a rain, most of the sewage in the pipes is flushed rapidly to the outfall, and the remaining quantity is greatly diluted before any part of it flows over into the river; and because, secondly, I have myself repeatedly observed the action of such overflows, and, learning also from others who had a more frequent opportunity to do the same, feel safe in asserting that experience does not substantiate the objection, whenever the works were properly designed.

I think the foregoing discussion will satisfy you, that not only the special features of my plan, but also the general ones compared with those recommended by Col. Waring in no way justify his remark that they are "very crude, imperfect and unsatisfactory." On the contrary, it would seem, if the remark can apply to either, that it applies with some force to his own plan.

First, on account of his ignoring the essential question of rain-water removal in general, and 2nd, from the most troubled sections of your city in particular; 3d, from an insufficient study into the alignments for the First Ward main sewer, and 4th, for the removal of the sewage from the extreme northern part of the city; 5th, from the abandonment of some of the best sewers for the purpose they have been heretofore satisfactorily used; 6th, from a less perfect design in the alignment of pipe sewers.

The best modern works upon which my designs have been based, are successful and satisfactory; and the principles recommended to you are held, as I have shown, by most eminent engineers. They are further justified, in my own mind, by a careful study into these questions and of many executed works.

Digitized by Google

Whatever success there has been with the Memphis sewerage is without doubt due solely to the several principles given above, which have been known to the world and practiced for some time. Those which, in my opinion, were advisable for your town, I have recommended to you, the others I have not.

The special note printed by Col. Waring, on the cover of his letter, giving an extract from the Memphis *Ledger*, in which is said that the people of that town would not sell the "Waring Sewerage System" for a million dollars, shows plainly that the long existence of the Separate System in England could not have been known to this editor.

I beg leave, in closing my communication, to quote from an editorial of another paper — THE SANITARY ENGINEER of New York—among periodicals probably the best authority on such questions in the world (September 14th, 1882): "It is unfortunate that the separation of sewage and rain-water in town wastes has been developed into a "system," and as such been treated in a commercial rather than engineering spirit." "An old established and much used method of procedure may be taken up by some shrewd person and widely and enthusiastically advertised and puffed and proclaimed to be a panacea." "Inexperienced engineers and amateurs outdo their preceptors in invectives against any application of the fundamental principles of civil engineering, viz., the application of common sense and science and experience to the solution of problems of construction." "Professional men who have minds of their own adopt what extremists on each side sneer at as a compromise, but which is really a wise, 'natural selection.'"

Yours respectfully,
RUDOLPH HERING,
18 Tribune Building, N. Y. City.

March 31, 1883.

PLUMBING IN A WEST-SIDE HARLEM RESIDENCE.

The portion of this city just north of 125th street, west of Fifth avenue, is being rapidly built up in apartment houses, flats and private residences, which are being occupied mostly by the more cultivated people of moderate

Figure 1.

means. The Inspector of the Board of Health for that district informs us that the plumbing of these houses is generally well done, and in accordance with the plumbing regulations; he has occasion to report but few violations, and very seldom any of a serious character. The most expensive class of plumbing, such as our descriptions have been mostly confined to heretofore, is not to be looked for in this district. The new residence of Mr. William H. Arnott, 122 West 126th street, contains, however, some very good work, done by Mr. Cauldwell Fraser. The following description of some of the more novel and interesting features may be of interest.

The method of draining the front area through the fresh-air inlet is shown in Figure 1. The connections with the area cesspool (which has a bell trap) and the air inlet are each 3-inch. The latter opens in the face of the wall of the front steps, near the front corner of the area, about ten feet from the wall of the house, and a foot above the area surface. The mouth is open and unobstructed by any plate, cap or gauze. The house drain is of extra heavy iron, six inches in diameter. For about half its length it is under the concrete cellar floor, resting on the earth, and the rear half is fastened to the cellar wall, having a grade of about one in fifteen. It was at first designed to run it all the way through the house above the ground in this manner, but as it would have interfered with the cellar stairs, it was turned down into the ground at an angle of about 60° with the horizontal just before reaching them.

Fig. 2. shows the connection of the refrigerator waste with the 6-inch house drain, or rather the method of discharging the water from the ice-box into the drain—there is no direct connection. The zinc waste pipe from the refrigerator projects an inch or two below the cellar ceiling; over this is slipped loosely a lead pipe, strapped to the wall and ending a few inches above the open end of an enlarged extension of the S-trap just above the drain. As ice is kept in the refrigerator the year round, this trap is expected to be always full.

All the other fixtures of the basement have their traps below the floor in the cellar, as shown in Fig. 3. The trap

Figure 2.

there represented is on the waste pipe from a servants' hopper closet which is situated in a narrow room beside the passage way to the back door and entered only from the yard. The air pipe for the traps is half concealed in the ceiling, as shown; just beyond the last inlet from the fixtures the house drain is reduced to 4-inch, which takes a 4-inch rain leader on the outside of the wall, trapped underground. A 3-inch connection from the back area cesspool, enters the rain leader trap below the water-line, and is also trapped again just outside the cesspool.

The water closets and baths on the upper floors are set on platforms raised six or seven inches above the floor to

Figure 3.

give room for the traps. The closets are of the plunger type and are glass lined. The bathing troughs in an aviary on the fourth floor are all connected by running full size through the cage divisions, and have a single standing overflow discharging into the 3 inch line of bath tub waste-pipe, after passing a half-S trap. All the waste pipes are in recesses in the wall, covered by wooden panels fastened with screws. The safe wastes have open ends just under the cellar ceiling. The following is a summary of the fixtures: Three water closets, two baths, nine basins, three wash tubs (having a single trap), one kitchen, one butler's pantry and one slop sink.

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.*

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

(Continued from page 436.)

Couplings.—The internal threads in the sockets or fittings, by which the tubes are connected together, require the same accuracy of workmanship as the external threads on the tube ends. In practice it is found that the straight couplings or sockets, connecting tubes in the same straight line, may be made of wrought iron, and may be tapped parallel instead of taper; they are sized to screw freely upon the small extremity of the tapering tube-end up to as far as half the length of the perfect thread on the tube; and they then become stretched by the force exerted in screwing them upon the remaining half length of larger diameter, and form their own taper to fit the tube. To allow for clearance between the ends of the two tubes united by the coupling socket, the length of the coupling is made as nearly 2½ times the length of the perfect-threaded tube-end as will suit the width of iron from which the coupling is manufactured. The minimum thicknesses of metal for the several sizes of couplings previous to tapping are given in Table III., with their corresponding diameters and lengths.

*The three lengths marked by an asterisk are increased disproportionately for appearance.

This parallel tapping is not altogether satisfactory for the straight couplings for tubes above 2½ or 3 inches nominal diameter, and the joints so made are not reliable if screwed up with the ordinary tongs; for elbows or tees the method is very unsatisfactory. Tapering threads are usual in the wrought-iron sockets for the "oil-tubing" in petroleum wells, and for the "line pipe" through which the petroleum is conveyed; these tubes range from 5 to 10 inches in diameter, and are subjected to pressures of 1,200 to 1,600 lbs. per square inch; the tubes themselves are frequently burst by the pressures exceeding those, but the joints are perfectly reliable and unyielding. In the original construction of taper joints by Mr. Joseph Nason, the sockets of all sizes were made taper; the subsequent departure from this practice was a matter of cheapness in manufacture, and has never been a mechanical success.

The great power required for tapping a tapering thread in wrought-iron, and the extra cost of making wrought-iron elbows and tees, etc., have led to the employment of cast iron as the material for the fittings or couplings. Careful study having been bestowed upon the reduction of the material to the smallest quantity requisite, and upon the production of the cored castings with the least amount of preparatory work, these cast-iron fittings have now become universal for all joints of wrought-iron tubes, excepting only the straight couplings already mentioned. The scale drawn one-quarter full size in Fig. 2 gives the exact dimensions for all parts of every possible elbow, tee, cross, or branch, for tubes of ⅛ inch up to 8 inches nominal inside diameter. With these dimensions the least quantity of material, consistent with uniformity of strength, is here employed, and is arranged in the most compact form. A longitudinal section is shown in Fig. 3 of a 1¼-inch elbow, that is, the elbow suitable for a nominal 1¼-inch tube. The dimensions for this section are obtained from the

*A paper read before the Institution of Civil Engineers, November 28, 1882.

Digitized by Google

scale by measuring, along the vertical line headed 1¼-inch, the height of ordinate intercepted between the horizontal base or zero line and the slant line marked by the letter corresponding with that on the section. In the two orifices, which have to be tapped subsequently for screwing upon the tube-ends, the diameter (twice the dimension marked D in the section, Fig. 3) is cored just so much smaller than smallest diameter of the root of the thread on the tube-end as will allow for removing the scale of hard iron from the casting by means of a drill; after which a taper tap, corresponding with the external thread on the tube-end, produces the internal thread in the socket, cutting with the proper taper a perfect thread inside the orifice throughout the whole of its length, marked L in the section. There are, therefore, excepting in special cases, no imperfect threads in the cast-iron fittings or sockets.

It may be well to explain, in regard to the construction of the scale shown in Fig. 2, that the ordinates, though here headed for convenience with the nominal inside diameters of the tubes, are spaced from the zero point at horizontal distances (half full size) equal to the actual outside diameters, as given in the foregoing Table II.* Of the slant lines, only two pass through the origin or zero point:—namely, the line for the internal radius R of the back of the elbow, and the line giving the dimension A, which is exactly half the radius R. Of the remaining lines, those giving the three dimensions B, D, C, intersect the base line a little to the left of the origin or zero poin'; which means that each of the three dimensions given by these lines contains some small increment in excess of the dimension that would be strictly proportional. For instance, with regard to the thickness C at the back of the elbow, it is evident that, if the metal in any casting, whether small or large, thin or thick, were truly homogeneous throughout both its skin and its interior portion, this thickness should then be strictly proportional to the diameter or radius of the bore; but for small castings a certain allowance of extra thickness is need ed, in order to insure soundness, as well as to compensate for the increased brittleness of thin cast-iron. There will, however, be some size of fitting, for which the normal strength of metal may safely be assumed, and for which, therefore, no extra thickness will be needed. On this assumption the thickness for the largest size is set out at the end of the scale furthest from the origin; while nearest to the origin is set out the thickness proper for the smallest size in which the increment is at its maximum; and the slanting straight line drawn between these two extremes gives for intermediate sizes an increment which varies inversely as the diameter or radius. Needlessly complicated formulæ, involving higher or lower powers of the diameter, are thus replaced by the simple straight line. In the two bottom lines L and F, pertaining to the screwed portions of the fitting, which are a function of the pitch, the irregularities of slope are due to the fact already commented upon, that the pitch of the screw-thread for different diameters of tube proceeds by a medley of arbitrary jumps, instead of by a steady progression concordant with that of the tube diameter.

[To be Continued.]

E. G. LOVE, Ph.D., *Gas Examiner.*

CONVICTED OF SELLING KEROSENE OIL BELOW THE STANDARD.

As some of our readers are aware, the State Board of Health some time ago secured the indictment of one Newman J. Nobles, of Batavia, for selling kerosene oil in violation of Chapter 292 of the Laws of 1882.

The act referred to prohibits the sale of illuminating oil which shall emit an inflammable vapor below 100° F., when tested by the instrument approved by the State Board of Health.

On the night of Oct. 4th last the dwelling of Mrs. Gay, in Batavia, was destroyed by fire, and her daughter was burned to death. Mr. A. L. Colby, an inspector under the Board, was sent to Batavia to inquire into the cause of the accident, as it was reported to have been caused by the breaking of a kerosene lamp.

It was found that on the night mentioned Mrs. Gay was moving about the house, and accidentally dropped the lamp, which was broken, and the oil igniting produced the results described. It was also learned that the oil was bought from H. B. Delano, a grocer of the village, who in turn purchased it of N. J. Nobles, a jobber, who sold considerable oil in the western part of the State.

Samples of the oil were obtained by the inspector, and sent to the analyst for examination. It was found that the oil flashed at 77° F., or 23° below the standard. Mr. Nobles was arrested in December last, and had an examination before a Justice of the Peace, who discharged him on a technical point.

In March, the case was brought before the Grand Jury, and Mr. Nobles was indicted. The trial was commenced at Batavia on the 17th inst. Mr. W. P. Prentice conducted the case for the people, while the defendant was represented by Mr. George Bowen.

Mr. Colby testified to the buying of the sample of oil, and to the fact that it was drawn from the same barrel as the oil sold to Mrs. Gay.

Prof. S. A. Lattimore, of Rochester, testified that he received the oil and tested it by the instrument approved by the Board of Health, and that it flashed as low as 77° F. In one test in which the torch was not applied until the thermometer reached 85° there was a sharp explosion, which lifted the cover of the instrument.

In opening the defendant's case, Nr. Nobles was called to the stand and testified that he bought the oil of the Phœnix Refining Co., of Buffalo. He also acknowledged selling oil to Mr. Delano, but would not admit that he knew for what purpose it was bought.

Officers of the Phœnix Co. testified to the selling of the oil, and stated that it was tested before shipment, but not by the instrument adopted by the Board of Health.

Dr. E. G. Love, of New York, testified in rebuttal that the tester used by the defendant's witnesses was not the authorized instrument. He described the differences between the two testers, and stated that an oil would not flash at as low a temperature by the instrument used by the Phœnix Co. as by that adopted by the Board of Health. He explained the difference between the flashing point and the burning point, and stated that there was no fixed relations between them.

The case was given to the jury, who returned in 15 minutes with a verdict of "guilty." Sentence was deferred; and it is reported that the case will be appealed.

This trial is one of considerable interest, inasmuch as it is the first one brought under the new law.

The officers of the Phœnix Refining Co. gave the method of oil inspection which seems to prevail at Buffalo. It was stated that the inspector of the Buffalo Fire Department examined oil in lots of 500 or 1,000 barrels, and then left his stamp with the company who marked the barrels. This plan is certainly simple, if nothing else. The oil sold by Mr. Delano to Mrs. Gay was branded in this way.

STORAGE OF ELECTRICITY.

The members of the New York Electrical Society assembled recently in one of the lecture rooms of the Stevens Institute of Technology, Hoboken, N. J., to hear a paper on the "Storage of Electricity," by President Henry Morton of the above named institution.

The room was brilliantly illuminated by incandescent lamps supplied by the Edison Electric Lamp Co., which were supported in chandeliers and brackets of tasteful design. There was also on the lecture table a two-horse power electric motor manufactured by the Western Electric Co., provided with measuring instruments to show the amount of electric current used, and a dynamometer to measure the power generated. The electric lamps and motor were supplied with electricity from a number of wooden boxes arranged in front of the lecture table and at the back of the room, which contained the electric storage batteries known as the Selou-Volckmar Accumulators. These were made in England at the works of the Electrical Power Storage Co. of London, and have been for the last three months at the Stevens Institute, where they have been rigorously tested by President Morton as to their electrical properties and capacities.

President Morton opened his paper by describing the fundamental principles involved in any of the present methods of electrical storage, and then proceeded to give a very brief historical sketch of the discovery of these principles and their application to this subject.

He first alluded to and described the gas battery of Prof. Grove; then the secondary battery of Planté; then the improvements of Faure, Swan, Selou and Volckmar, culminating and combined in the battery used on this occasion, and now controlled by the Electric Accumulator Co. recently organized in this city. The peculiar structure of this battery was then fully shown, and it was seen to consist of plates, each made up of a fine lattice work of metallic lead filled in with a porous mass, which was in each alternate plate either metallic lead or the black per-oxide of lead. The manner of operation of these cells in charging and discharging was then explained at some length and the important part played by the absorbed or accluded gases was pointed out.

President Morton then stated the results of some of his tests made upon these batteries. These showed that each cell would yield a continuous current of about 32 amperes for nine hours, with an electro-motive force of about 2.2 volts. This quantity of current would supply 44 of Mr. Edison's incandescent "A" lamps of 16 candle power, and its intensity would make it necessary to employ only 50 of the cells to obtain sufficient electro-motive force to overcome the resistance of such lamps. The entire weight of each cell ready for work is 80 pounds, and thus, as a simple rule, it might be stated that for each light of 16 candles for one hour ten pounds of battery should be provided, if the battery were used solely as a reservoir to contain the entire current required.

It was, however, pointed out in this connection that the battery in many cases would only be required to act as

Digitized by Google

regulator, not storing the entire amount of electricity used, but only taking up a temporary excess and providing for a similar deficiency. Under such conditions it would not need to have capacity to supply more than one or two hours of current, and nearly all the current during normal working would go directly from the dynamo machine, the fluctuations or momentary stoppages only being taken care of by the battery. To illustrate this, the lights in the room were connected directly with a dynamo and its current was caused to fluctuate so that the lights were extremely irregular; as soon, however, as the battery was also connected so that any excess of current could flow into it, and any deficiency be supplied by it, the lights became perfectly steady.

In the next place the use of the storage batteries as a means of driving street cars was touched upon. President Morton said that measurements which he had repeated (upon these batteries whose weight was 80 lbs. each) a number of times showed that each of them contained energy equal to about 1,800,000 foot pounds, or such as could develop one horse power for one hour nearly. In other words, the energy stored in one of these boxes, if fully converted into mechanical work, could take a "bob-tail car" full of passengers across town or from one end of the city to the other—in fact could take the place of a horse for an hour. Another mode of expressing this amount of energy was to say that such a battery, if its energy could be applied to lifting it up, would be able to raise itself 20,000 feet or four miles up from the ground.

To illustrate the operation of the batteries in driving an electric engine or motor, some experiments were made with one of these machines made by Mr. Edward Weston, of Newark, and similar to one used by him to run the machinery in a department of his shop. The machine being connected with the storage battery started at once into rapid motion, and a dynamometer as well as instruments to measure the electric current being applied, it was shown that the efficiency of the current in producing motion was very great.

Professor Morton also stated that he had given the battery a practical test by placing some cells in his house and using them to operate electric lamps in his parlor and dining room. They had been in constant operation there for over three months, during which the battery had to be recharged only four times. This recharging was affected once by removing the battery to the Stevens Institute and since by connecting it with a telegraph line running between the institute and his house.

According to his measurements President Morton said that this battery had fully double the capacity of the Faure battery and many times the capacity of the Planté battery or of the Cabath cell or other modification of the Planté apparatus, and while much remained to be done in the improvement of its construction and in the development of appliances necessary for its ready use, yet it had certainly reached a remarkable degree of efficiency already.

CONSIDERATION OF THE UNDERGROUND WIRE PROBLEM.

Representatives of nearly all the telegraph, telephone and electric light companies of this city were present at a meeting called by Col. R. R. Hazard, president of the Gramme Electrical Company, at this company's office on Friday last, to consider the expediency and best methods of procedure in regard to putting all wires in this city underground. Resolutions were adopted favoring an extenstive examination to determine whether any inclusive system can be found, and the appointment of a committee for this purpose, consisting of one delegate from each electrical company, the governor of the State and the mayor of the city. We will comment on this action in our next issue.

ELECTRIC LIGHT NOTES.

The Hartford Electric Light Company will have 100 lights in operation in that city in a few days. The company has now 28 paying lights, 21 of which are at the depot.

The Troy Electric Light Company has been incorporated with James A. Kaveny, E. W. Hydorn and J. Bartlett Hydorn as incorporators. E. W. Hydorn says he will make a contract for five years to light the city by electricity for $25,000 a year.

The building containing the generating apparatus of the Brush Company, at Cincinnati, was burned on the 21st inst.

A scheme has been proposed for lighting the entire Swiss Canton of Vaud by electricity. The motive forces would be derived from turbines of 5,000 horse power, the water supply being constant and abundant.

The Dakota apartment houses at Eighth avenue and Seventy-second street, this city, are to be lighted with 5,000 Edison lamps, of 16 candle power each. The apartment house 121 Madison avenue will have about 1,200 lamps.

Meter-ites.

The Baltimore gas companies have agreed to charge $1 per 1,000 cubic feet, and one of the St. Louis companies has reduced its price from $2.50 to $1.50.

Health Commissioner Raymond, of Brooklyn, has sent to the Common Council a communication requesting the appropriation of $500, to be expended in making the analysis of coal and water gases, and investigating as to the number of deaths caused by each in New York and Brooklyn, which investigation was requested by the Lamp and Gas Committee. The investigation will cover the period since 1849, when there was the first record of a death from gas.

The Gas Commission have awarded contracts for the public lighting of the city for the year commencing May 1, as follows: New York, Manhattan, Mutual and Metropolitan Gas Companies, $17.50 per lamp; Harlem Gas Co., $19 50; Central Gas Co., $29 per lamp; Northern Co., $32; and Yonkers Co., $30 per lamp. The Brush Electric Illuminating Co., and the U. S. Illuminating Co., receive contracts as at present at 70 cents per lamp per night, for arc lights. It was stated that each electric light displaced six and one-third gas lamps. The cost of lighting by gas, therefore, is $110.83, as compared with $255.50 for electric lamps, or a difference of $144.67 in favor of gas.

The report of Mr. S. McCormick, Supt. of Lamps and Gas, for the quarter ending Dec. 31, 1882, shows that on that date there were 23,747 gas lamps and 128 electric lamps in this city. Of the electric lamps 55 were furnished by the Brush Co. and 73 by the United States Illuminating Co. The 73 lamps of the latter company replaced 507 gas lamps. The cost of lighting the public lamps (not including electric lamps) was $464,684.80 for the year. The electric lamps, cost $22,500.74; but of the total number of lamps, 73 were not lighted throughout the entire year.

The report contains the following facts relative to the working of the two electric light companies: The U. S. Illuminating Co. has 166½ miles of wire conductors on poles, 553 arc lamps on 31 circuits, and five stations. The Brush Co. has 150 miles of wire conductors on poles, 1,113 arc lamps on 17 circuits, and two stations.

NEW JERSEY ANALYSTS.

The New Jersey State Board of Health held a meeting at Trenton, on Friday, April 13, at which, besides the ordinary routine of business, the appointment of analysts under the provisions of the amended Food Adulteration Law were made. Prof. H. B. Cornwall, of Princeton, Prof. F. A. Van Dyke, of Rutgers College, New Brunswick, and Mr. Shippen Wallace, of Burlington, were appointed analysts, and Dr. Wm. K. Newton, State Inspector of Milk, as inspector. These, together with Dr. Cyrus Brackett and Dr. Albert R. Leeds, constitute the Committee of Analysts; the two latter gentlemen are *ex officio* members, representing the State Board of Health, Dr. Leeds being Chairman of the Committee. The Committee were instructed to prepare and submit to the Board, for their approval, a plan of operations.

RULINGS AS TO MIXTURES.

NEW YORK, *April* 22, 1883.

To the Editor of THE SANITARY ENGINEER:

Can you inform me whether the resolutions relating to coffee and mustard mixtures, passed by the State Board of Health at their last meeting, and printed in your issue of March 1, have as yet been signed by the Governor, and consequently become law? Also, whether the resolutions passed at the previous meeting of the Board, fixing the standard of cider vinegar, has been approved by the Governor? I notice the resolution refers especially to "cider vinegar." Are vinegars from other sources than cider included in the resolution? If so, would not a legal difficulty arise in case of prosecution unless the analyst could prove that it was a genuine cider vinegar?

Yours, etc., FRIEND.

[The coffee and mustard mixture standards have received the Governor's approval, as will be seen by reference to our issue of April 5. The suggestion about vinegar should be called to the attention of the Attorney of the Board, and his opinion obtained.]

SKIM MILK LAW IN NEW JERSEY.

The New Jersey State Inspector of Milk has sent out the following notice:

OFFICE OF THE STATE INSPECTOR OF MILK,
PATERSON, N. J., *April* 16, 1883.

Your attention is called to the provisions of Chapter 185, Laws of 1883. This law, passed by the Legislature of this State and signed by the Governor, March 23, 1883, provides that no milk from which the cream or any part thereof has been removed shall be brought into or offered for sale in any city of the first class, under a penalty of $50 for the first offence and $100 for the second offence.

This law repeals the permission formerly given to sell skimmed milk in marked cans. WM. K. NEWTON,
State Inspector of Milk.

Correspondence.

PLUMBERS' PROFITS.

MONTREAL, *April* 18, 1883.

To the Editor of THE SANITARY ENGINEER:

Mr. Moody's letter opens up an interesting question, viz., the progress of a better class of ideas among the general public in regard to the plumbing trade. I may say that progress has been made here, but so far it partakes more of the nature of inquiry than of the actual fitting up of superior work, although it cannot be denied that work of late years is in the direction of a class of jobs on more correct principles. Our people are beginning to realize the fact that there are two kinds of plumbing work, but the contract system is universal, there being only enough exceptions to prove the rule. The want of a plumbers' by-laws is certainly felt, but some progress has been made in that direction. Our architects are also waking up, but need educating in the direction of a knowledge of the cost of work as called for, it being not infrequent that work is taken at a price that would not pay for the cost of materials as specified. Hope you will endeavor to enlarge the circle of your readers in our city. The trade here is not the bonanza the public think.

G. W. HUGHES.

WINDOW VENTILATORS.

PHILADELPHIA, PA., *April* 11, 1883.

To the Editor of THE SANITARY ENGINEER:

I notice in your issue of the 5th inst., page 415, an inquiry regarding window ventilators. Having had occasion to use something of the kind, I have devised and used with very good results a modification of the old plan of setting a strip under the sash, for the sake of the air entering at meeting rails, of which please find a sketch enclosed.

It consists simply of a piece of board, as long as the width of window and three or four inches high, set about an inch back of the sash and secured in place by vertical grooves in the ends, sliding over two round-headed screws in the stop head at each side of window.

By raising the sash a trifle, air is admitted in a thin sheet and deflected upward, and there is the same action at the meeting rails, which is all I have ever seen attempted by anything of the sort. A wire-gauze screen can be bracketed to the outside of the strip if desired.

The cost is nominal; there is no interference with using and fastening the sash in the usual way; the strip can be removed in an instant, and whether it is in or out, the window is not disfigured. Yours, C.

LEAD BURNING.

NEW YORK, *April* 18, 1883.

To the Editor of THE SANITARY ENGINEER:

Having seen Mr. Walker's letter on lead burning in your issue of April 5, I would like to suggest that some of his patches can be made more simply than he describes.

In regard to Figure 5 of Mr. Walker's letter, each and all

Fig. 1. Fig. 2. Fig. 3. Fig. 4.

of the patches can be placed on the outside of the lead without the jog which he shows, and can be burned underneath as well as by inserting the bottom part of the patch in the back sheet of lead, though I admit it takes more skill, because the lead has a tendency to drop from the lower part of the patch; but the skill in managing the blow pipe to prevent this is the work of a good lead burner. For instance, the amount of work on the patch *F* in Fig. 5 of Mr.

Figure 5.

Walker's letter is nearly double what it would be if done by this method. The little drawing I inclose shows the difference, and why the latter is more simple, Fig. 1 being Mr. Walker's way, and Fig. 2 the better plan.

In making a joint on a horizontal pipe, instead of opening the pipe on top, the ends of the two pipes are to be inserted and burned on the outside all around, thus showing that a great deal less work is required, besides avoiding cutting the pipe.

Figure 6.

In regard to his getting oxygen from the hydrogen generator, I raise the question how this can be done. I have always used a bellows and cannot do without it. I would like to have Mr. Walker explain just how he does it.

Figures 3 and 4 show specimens of work with thick and with thin sheets. Fig. 5 a round patch shown in elevation and section, *A* being the patch. Fig. 6 is the apparatus, *A* is the hydrogen generator and *B* the bellows.

Yours truly, CHARLES E. FIELD.

115 John street.

NEW YORK, *April* 13, 1883.

To the Editor of THE SANITARY ENGINEER:

Mr. Hudner can burn his boxes as handily with the hatchet bolt as with the machine. It is as simple as soldering on small work like that, as twenty years ago, ten out of twelve plumbers would tell you. M. R.

GAS FITTING IN TOPEKA.

OTTUMWA, IOWA, *April* 16, 1883.

To the Editor of THE SANITARY ENGINEER:

Seeing in your last issue an application for a drawing with location of gas fixtures and meters for an office building in Topeka, Kansas, I thought it looked as if folks there were not posted much in such matters.

In justice to the trade, I would say there are several practical men there who have done the fitting in some of the largest buildings in the East, and who are capable of locating fixtures or meters in any building that will ever be erected in a country town like Topeka, as they have proved themselves to be in fitting up the largest office building in the town, recently built there.

Respectfully yours,

ONE OF THE TRADE.

AN ACT

Relating to the further supply of pure and wholesome water for the City of New York.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Commissioners of the Sinking Fund of the City of New York are hereby authorized and empowered to make and cause to be made such investigation as they may deem necessary and proper, to enable them to ascertain and determine the practicability of securing for said city a permanent supply of pure and wholesome water to meet the growing demands of the city, from the district embraced in the counties of Rockland and Orange; and for this purpose to take all action suitable and necessary, and to secure the services of such competent persons as they may select to aid and assist them therein.

§ 2. The Department of Public Works of the said city, and the Commissioner of Public Works, the head of said department, is hereby directed to furnish all information required, and such assistance as may be deemed necessary by the said Commissioners of the Sinking Fund in the performance by them of the duties specified in and required by the preceding section of this Act, and the Board of Estimate and Apportionment of said city shall appropriate such amount as in its discretion it may deem necessary to enable the said Commissioners of the Sinking Fund to perform the duties aforesaid, and such amount, certified by the Comptroller of the city, shall be added to and included in the final estimate of the city for the year eighteen hundred and eighty-three.

§ 3. When satisfied, after such investigation as they may deem necessary, that it would be for the public interest so to do, the said Commissioners of the Sinking Fund may, at their discretion, make and enter into a contract of lease for such period as they may determine, containing such conditions, provisions and stipulations as the said Commissioners may consider to be necessary and proper in the interests of the city, with any corporation formed, or which may be formed, under and pursuant to the authority conferred by chapter eighty-five of the laws of eighteen hundred and eighty, and chapter four hundred and seventy two of the laws of eighteen hundred and eighty-one, for the delivery by such corporation, from the district embraced in said counties of Rockland and Orange, to the City of New York, within two years from the date of such lease, of not less than fifty millions of gallons of pure and wholesome water daily, during the continuance of such lease, with a pressure due to a head of three hundred feet above tide everywhere in the city, the water so to be delivered to be equal in purity to the water supplied from the Croton system, and the rate of compensation therefor not to exceed for each million of gallons supplied the actual cost during the year eighteen hundred and eighty-two of each million of gallons supplied to the city from the Croton system, during such year, as shown by the actual expenditure by the city during the year, and which lease may provide for the purchase by the city of all the rights and interests of the said corporation in and to the water rights and grants obtained and secured by them, and the works constructed by them for the delivery in said city of fifty millions of gallons of water daily, when the said Commissioners of the Sinking Fund shall deem such purchase to be for the interest of the city, provided such purchase is determined upon by said Commissioners within three years from the date of the completion of such works, and that the cost of said purchase shall not exceed the sum of six millions of dollars; and whenever required so to do by the said Commissioners of the Sinking Fund, it shall be the duty of the said Commissioner of Public Works, under the authority now conferred by law, to proceed with and perfect such works as may be necessary within the limits of said city for receiving and fully utilizing to the public use the water furnished and supplied to said city, pursuant to such contract of lease, but nothing in this lease contained shall be held as in any way interfering with, hindering or delaying the construction and use of such works now authorized by law, or which may be hereafter authorized, relating to the procuring or obtaining an increased supply of water from or in connection with the Croton aqueduct system of said city.

§ 4. Whenever the said Commissioners of the Sinking Fund shall deem it to be for the best interest of the city, they may authorize the construction of a special fire service in connection with the supply of water hereby provided for, for the use of the dry goods district of the city, so-called, and to make and enter into such contracts and arrangements with the said company as may be necessary for this purpose, and to fix and determine the rental of each occupant and owner in said district for the use and service thereof, and upon the faith and credit of such rental, to authorize the Comptroller of said city to borrow, on the bonds of the city, such sum as may be found necessary to meet the expense of constructing such service, not exceeding one million dollars. The rents received for the use of such special service to be applied to the payment of the interest upon such bonds, the balance to be paid into the Sinking Fund of said city, to be applied to the payment of the principal of said bonds at maturity.

§ 5. This act shall take effect immediately.

PERSONAL.

Dr. G. B. Thornton, of Memphis, has been re-elected a member of the State Board of Health of Tennessee. Dr. T. A. Atchison, of Nashville, was elected President and Dr. J. M. Safford, of Nashville, Vice-President of the Board.

Mr. Carl Hering, assistant to Prof. Barker in electrical engineering, University of Pennsylvania, has been commissioned by the Franklin Institute to visit the Electrical Exposition held in Vienna this summer.

Governor Stoneman has made the following appointments of members of the State Board of Health of California:—Drs. W. A. Douglass, J. C. Shorb, O. O. Burgess and Arthur W. Perry.

Dr. Cameron, analyst for County Down, Ireland, in his recent half-yearly report, states that, as compared with former returns, a great improvement has taken place in the quality of the articles of food and drink sold in the county. Of 114 specimens of food sent for analysis, only five were adulterated, viz.: two of whiskey, one of coffee, and three of milk.

MILWAUKEE SCHOOL PLANS.

At its last meeting, the Milwaukee (Wis.) City Council appropriated $500 for model school house plans, and the Board of Public Works will soon advertise for the same. All school buildings hereafter will be constructed according to one of those plans. Special specification is made for substantiality, good heating, lighting and ventilating facilities. The plans are for school buildings of four, eight and fourteen class rooms respectively.—*Milwaukee Sentinel, April* 20, 1883.

PENNSYLVANIA.—A joint resolution has passed the Pennsylvania House authorizing the governor to appoint a commission to suggest remedies against the pollution of rivers.

Small-pox has almost depopulated Morristown, Tenn. Five hundred people attended the funeral of two men supposed to have died of measles, and many were stricken with the scourge.

Digitized by Google

Construction Notes.

The Rœsch Bill, to prevent the Board of Health of New York from prohibiting the use of vitrified drain pipe inside buildings, passed the assembly of this State, on the 23d inst. Before becoming a law it has to pass the senate and secure the Governor's approval.

ALBANY.—The bill appropriating $1,000,000 for the new capitol, having previously passed the Senate, was last week put through the Assembly.

WALTHAM, MASS.—Fuller and Delano are architects for two brick school houses, which are to be built this spring, and for which proposals are asked by E. W. Lane, Secretary of the Committee.

NIAGARA RIVER.—Engineers have begun locating the stone piers of the new bridge. It will be 245 feet above water, and 500 feet span; length over all, 900 feet. The contract calls for its completion Nov. 1, 1883. The cost, with land for approaches and yards, will be upwards of $1,000,000.

SOUTH NORWALK, CT.—The bridge committee have closed contracts with S. A. Hammond, of Providence, for piling and mason work, at $12,000, and with the East Berlin Iron Bridge Company, for iron work, at $9,650.

WOONSOCKET, R. I.—A resolution validating the action of the Town Council, in giving to George H. Norman exclusive right, for 50 years, to lay water pipes in the town, passed the State Senate April 11. During the debate it was stated that the cost of laying the pipes, etc, will cost between $300,000 and $400,000.

PHILADELPHIA.—The final report of the Board of Experts appointed to consider the water supply of the city, was sent by the Mayor to the City Councils last week. The members of the Board are: E. S. Chesbrough, J. U. Merrick, Frederick Graff and William Ludlow. They recommend the application of the $525,000, which is available as follows:

For Schuylkill Works, $263,000; Germantown mains, $70,000; Roxborough, $62,000; Frankfort, $50,000; surveys for determining sources of future supply, $20,000; leaving a balance of $59,500, of which $39,500 should be transferred to the item for "buildings, grounds and reservoirs," and $20,000 allotted to the general contingencies of the department. They advise for the Schuylkill and Roxborough Works horizontal compound duplex engines, similar to the Worthington engines, and for the Frankfort Works a compound rotating engine.

On the question of purifying the Schuylkill and Delaware rivers at the points where the water supply is taken, they say if the impurity can be reduced to a safe point, the present sources of contamination removed and guarded against for the future, and sufficient quantities be had, it it is unnecessary to look to more distant sources. If this cannot be accomplished, it will be needful to draw from one or the other of these rivers at points higher up. Careful detailed analyses must be made of the water obtained from different points, in order to trace the causes of impurity, as well as careful topographical and geological surveys. Gaugings of the streams and of the rainfalls over the areas draining into the Perkiomen, Skippack, Wissahickon, etc., are required, as well as the affluents of the Delaware, if such should be found necessary. The surveys should be especially directed to ascertaining where, to what extent, and at what cost impounding reservoirs can be constructed, and the several available routes for conduits carefully investigated, with a view to determine their cost. They advise that measures should be taken to check waste, and say on this point:

"It is impossible even to approximate the amount of water used, on the basis of a given size of ferrule, because the quantities passing vary in different localities according to the pressure, and because the use in some localities is more constant than in others. The only equitable mode of assessing in such cases is by the quantity actually consumed. This at the same time should check wastefulness. In most of the large cities the use of meters for large consumers has been found of great value. On the other hand, it is not desirable to affix meters to houses. The first cost of these would have to be borne by the department, but they might be made to earn a large interest on the investment, and would undoubtedly result in so considerable an increase of revenue, in certain cases, as to warrant a reduction in others, and the furnishing of water to houses at a cheaper rate than at present. At the same time it would be found that the consumption per capita would decrease, and with it, proportionally, the expense of the department."

The Gas Trustees, at their meeting last week, rejected the contract awarded to Michael O'Rourke for excavating for the big gas main, at $14,971, on the ground that O'Rourke was a member of councils, and forbidden by law to have an interest in any contract with a city department. Proposals will be re-advertised for.

The sub-committee on extension of works of the Water Committee of Councils, reported on the 17th inst., recommending an appropriation of $251,500 for new works. The report was adopted, and the Chief Engineer instructed to proceed with the work.

NEW BEDFORD, MASS., has appropriated $100,000 for additional water mains and meters.

COLUMBUS, O.—Proposals for completing the northwest main trunk sewer will be received by John Graham, City Engineer, until April 30.

WILMINGTON, DEL.—The Levy Court, April 12, voted to construct a new bridge on the line of Market street, to be of iron, with draw 236 feet long. Estimated cost, $55,000 to $57,000.

BROOKLYN.—The Aldermanic Committee on water and drainage have decided to appropriate $7,102 for replacing cement water pipe in Bedford avenue with iron pipe, and favor an appropriation of $9,586, for substituting iron pipe in Wilson and Taylor streets and Lee and Wythe avenues.

NEW YORK.—The Department of Public Parks ask for proposals, until May 2, for constructing 540 feet of 12 inch pipe sewer and appurtenances in 144th street; also 175 feet of brick sewer, 3 feet by 2 feet 2 inches; 862 feet of brick sewer, 2 feet 6 inches by 20 inches; 284 feet of 12-foot pipe sewer; 306 feet of 15-inch pipe sewer; 1,685 feet of 12-foot pipe sewer and appurtenances, in North Third avenue and 167th, 163d and 164th streets; also for 1,270 feet of 12-foot pipe sewer in 138th street; also for paving, grading, etc., between Southern Boulevard and North Third avenue.

The following are the lowest bids received at the Department of Docks on the 19th inst.: For labor and material for building a wooden platform north of the storehouse pier on Blackwell's Island, James D. Leary, $1,589; for crib bulkhead, with appurtenances and filling, in rear of same, at foot of 99th street, East River, James D. Leary, $5,490; for bulkhead platform at foot of 104th street, Harlem River, James D. Leary, $1,094; for new wooden pier, with temporary approach at foot of 55th street, North River, John Gillies, $30,296.

AMESBURY AND SALISBURY, MASS.—The committee on water supply, of the State Senate, reported a new draft of the bill to incorporate W. E. Biddle, J. R. Huntington, M. D. F. Sleere, R. F. Briggs and E. R. Sibley as the Powwow Hill Water Company, to supply water to Amesbury and Salisbury, with a capital of $75,000; amended so as to provide that the supply shall be taken from the east branch of the Powwow River in Salisbury, known as Back River, at a point known as Clark's Pond.

MARBLEHEAD, MASS.—In the Senate, April 16, the committee on water supply and drainage reported a bill to incorporate the Marblehead Water Company, with a capital not to exceed $250 000.

HOLLAND, MICH.—The Common Council has been authorized to bond the city for $22,000 to establish a system of water works for city use, especially for defense in case of fire.

CONCORD, N. H.—A contract has been awarded to Messrs. Goodhue & Birnie of Springfield, Mass., to lay cement lined water-pipe, as follows: 11,460 feet, 18 inches diameter; 3,290 feet, 12 inches diameter; 650 feet, 4 inches diameter, for the sum of $44,900.—*Engineering News.*

LA CROSSE, WIS.—Benezette Williams, C.E., of Chicago, formerly in charge of the sewers of that city, and recently the engineer for the sewerage of Pullman, Ill., has prepared a plan of sewerage for the city of La Crosse, which, probably, will soon be carried out.

JERSEY CITY.—The Hackensack Water Company, from whose mains the city of Hoboken is now supplied, has proposed to connect its pipes with the Jersey City system, so as to prevent a water famine being caused in either city, either by the scarcity of the supply or by the breaking down of machinery. The matter was considered at a conference held yesterday between the directors of the Water Company and a joint committee of the Boards of Finance and Public Works, which resulted in the approval of the proposition and the adoption of a scale of prices to be paid by the city receiving the supply.—*N. Y. World.*

MAQUOKETA, IOWA.—It is intended to build water works, for which proposals will be received by the City Clerk until May 1.

CHICAGO.—Harry Fox & Co. were given a contract, April 14, to build the substructure of Ashland avenue bridge, for $6,502. The other bidders were Chicago Dredging and Dock Co., $7,000; Sooy Smith & Son, $7,448.

Bids to supply the city 50 tons of lead were received as follows: E. W. Blatchford & Co., $4.32½ per 100 lbs.; Jas. N. Raymond, $4.39½. The committee will re-advertise for 150 tons.

The Wolf Manufacturing Company receives the contract, at $4,725, to supply "corporation taps." The other bidders were: O. Owens, $4,800; Crane Brothers Manufacturing Company, $5,080; Wild & Hill, $5,610.

NEW JERSEY.—A resolution was adopted at the late session of the Legislature on the question of riparian rights that a committee of five members of this House be appointed by the Speaker to inquire into the subject of riparian rights, as they affect the State and its citizens, the said committee to have leave to sit during recess, with power to appoint a clerk, send for persons and papers, and to examine witnesses under oath; and that the said committee shall report to the Legislature, by bill or otherwise, at the next session.

The following members of Assembly were appointed as the committee: Messrs. Freeman, of Middlesex; Neigbour, of Morris; Robbins, of Hunterdon; Cator, of Hudson, and Cranmer, of Ocean.

A bill was introduced in the New York Senate, April 16, authorizing the Superintendent of Public Works to construct a reservoir on the Black River, at Forestport, Oneida County, and appropriating $20,000 for the purpose.

The committee on Water Supply and Drainage of the Massachusetts House have reported a bill to authorize cities, towns, fire districts and aqueduct companies to hold water for sale, and to sell the same to other cities, towns, fire districts and individuals.

GOVERNMENT CONTRACTS.

The following bids were opened, April 19, at the office of Gen. M. C. Meigs, Supervising Architect of the New Pension Building, Washington, D. C., for 12,500 pounds of sheet lead cut to dimensions. The bidders were as follows:

Le Roy Sheet Lead Manufacturing Company, New York, 6 cents per pound in New York; James Robertson & Co., Baltimore, 7 cents. The remaining bidders were all from Washington, as follows: J. B. Randall, 6⅞ cents; James Ragan, 9½ Robt. Leitch & Son, $6\frac{78}{100}$; W. Rothwell, 7¾; Thos. Sommerville & Son, $6\frac{7}{10}$; J. F. O'Brien, 8½; J. H. McGill, $7\frac{69}{100}$. The contract was awarded to J. H. McGill. The contract for 69,200 square feet of terra cotta ro fing has been awarded to the Potomac Terra Cotta Company, of this city, at 10 cents per square foot.

At the meeting of the Engineers' Club, of Philadelphia, April 7, Mr. Arthur Winslow described the derivation of tables for stadia reductions; Mr. C. O Hering presented a table of electrical units of work and power corresponding to all mechanical units, such as horse power, foot pounds, kilogrammetres, heat units, etc., and the Secretary presented for Mr. P. F. Brendlinger a description of a bridge specification. An amendment to the by-laws was passed, concerning methods electing members, and a committee was appointed to make a revision of the by-laws.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

At the meeting, April 18, the deaths of John C. James, of Winnipeg, and Simon Sheldon, of Cleveland, were announced. The Secretary stated that arrangments were well advanced for the convention of the society at St. Paul and Minneapolis beginning June 20. The president's address will be delivered at Minneapolis, where one meeting will be held, the ordinary meetings taking place at St. Paul. Arrangements are now being made with railroads and hotels for the conveyance and accommodation of members. A paper by the late Wm. R. Morley, on proper compensation for railway curves upon grades, was read by the secretary. It will be printed in the Transactions and will be discussed at the Convention.

CONSTITUTION AND BY-LAWS OF THE ASSOCIATION OF MASTER PLUMBERS OF THE CITY OF NEW YORK.

For the information of plumbers in other cities, who may be contemplating the forming of societies, we here print the Constitution and By-laws of the Master Plumbers' Association of this city.

ARTICLE I.

Name.

This Association shall be known as "The Association of Master Plumbers of the City of New York."

ARTICLE II.

Officers.

The officers of the Association shall consist of a President, three Vice-Presidents, a Treasurer, a Recording Secretary, a Financial Secretary, a Corresponding Secretary, a Sergeant-at-Arms, and three Trustees.

ARTICLE III.

Election of Officers.

The officers of the Association shall be chosen annually by ballot at the first meeting in January; and the respective persons having the highest number of votes shall be declared elected.

ARTICLE IV.

Duties of President.

The President shall have the general management of the Association, subject to the Constitution and By-Laws. He shall preside at all meetings of the Association, appoint all committees (except standing), see that the Constitution and By-Laws are enforced, and generally perform such duties as his position demands.

Duties of Vice-Presidents.

During the absence, illness, or disability of the President, each Vice-President (who takes precedence in the order of his election) shall have similar powers and duties.

ARTICLE V.

Duties of Recording Secretary.

It shall be the duty of the Recording Secretary to record the proceedings of the Association in books kept for that purpose, which he shall send or bring to every meeting, read and file all communications and other papers, keep a full roll of the members and their places of business, and perform such other duties incident to his office, as may from time to time be required of him.

ARTICLE VI.

Duties of Financial Secretary.

It shall be the duty of the Financial Secretary to keep a correct debit and credit account with every member of the Association, see that the dues and fees are kept paid up, receive and receipt for all moneys paid to the Association, and forthwith pay the same over to the Treasurer, taking his receipt therefor, and transact such other financial duties as may be required.

ARTICLE VII.

Duties of Corresponding Secretary.

It shall be the duty of the Corresponding Secretary to conduct the correspondence of the Association, notify members of the time and place of meetings, and also chairman of committees of such matters as may be referred to them, at the earliest moment thereafter, and such other duties as appertain to his office.

ARTICLE VIII.

Duties of Treasurer.

The duties of the Treasurer shall be to receive, through the Financial Secretary, all moneys accruing from every source to the Association, and pay over all sums above two hundred and fifty dollars to the Board of Trustees. He shall pay all bills against the Association, when duly authorized, and keep a full and accurate account of all moneys received and paid out by him. He shall pay out no money without taking a receipt for the same, and no bill or claim shall be paid by him unless approved by the Auditing Committee. He shall make a detailed and accurate statement of all receipts and expenditures for each quarter, at each quarterly meeting, and also a complete annual report and balance sheet at the close of the year.

ARTICLE IX.

Duties of Sergeant-at-Arms.

It shall be the duty of the Sergeant-at-Arms to guard the door at each meeting, and see that none but members of the Association, or authorized persons, are admitted, and fulfill such other functions as may be required of him by the presiding officer.

ARTICLE X.

Duties of Trustees.

The duties of the Trustees shall be to have charge of the library, corporate seal, and other property of the Association. They shall also receive from the Treasurer, and deposit in bank, at interest, all moneys above two hundred and fifty dollars. They shall withdraw no money from bank unless duly authorized, and then only by checks, signed by the President, Treasurer, and Chairman of the Board of Trustees. They shall have the duty of providing, by lease or otherwise, the apartments or premises required by the Association; and the employment of such necessary assistance, or purchase of material, subject to the approval of the Association. They shall make an annual report to the Secretary of State, as required by law, on or before the 24th day of December of each year.

ARTICLE XI.

Committees.

The Association shall have the following standing committees: the Executive, the Auditing, and the License committees.

ARTICLE XII.

Duties of Executive Committee.

The Executive committee shall be composed of all the officers of the Association, and of which the first Vice-President shall be chairman. Its duties shall be to examine into charges preferred against members, call special meetings whenever it may be deemed expedient, and exercise general supervision over the affairs of the Association, when such is not inconsistent with the Constitution and By-Laws.

ARTICLE XIII.

Duties of Auditing Committee.

The Auditing committee shall be composed of three members chosen by ballot at the annual election. It shall examine the current accounts and bills, the quarterly and annual reports of the Treasurer, the books of the Financial Secretary, and such other financial business as may be referred to it.

ARTICLE XIV.

Duties of License Committee.

The License committee shall consist of three members, chosen by ballot at the annual election, whose duties shall be to examine and report on all applications for license at the Department of Public Works.

ARTICLE XV.

Vacancies in Offices or Committees.

Any vacancy that may occur in any of the offices or committees shall be filled for the unexpired term by the presiding officer.

ARTICLE XVI.

Qualification of Members.

All plumbers, who have a license from the Department of Public Works of this city, and are creditably conducting business in a permanent location, are eligible for membership in this Association. This applies also to plumbers who are partners of members as well as to those conducting the business in permanent locations in surrounding cities and towns where licenses are not required, and then only within such limits as may be governed by the convenience of the applicant, and such distance from the city as may be deemed proper.

ARTICLE XVII.

Election of Members.

The name of any person wishing to join the Association must be proposed by a member. The proposal shall state his full name and place of business, be accompanied by the initiation fee, and then be referred to an investigating committee of three, appointed by the presiding officer. If the report be favorable, action shall be taken at the meeting next following by ballot. One-tenth of the votes, cast adversely, shall constitute a rejection of the candidate.

ARTICLE XVIII.

Duties of Members.

Every member, on his election, shall be required to sign the roll. He shall receive a certificate of membership, a copy of the Constitution and By-Laws, and pledge himself solemnly to abide by them, and also pursue such honorable line of conduct as is expected from members of respectable organizations.

ARTICLE XIX.

Honorary Members.

Honorary membership may be conferred in exceptional cases on persons who may be deemed worthy of the compliment. The person proposed shall have his name submitted to the Executive Committee, and if unanimously recommended it shall then be referred to the Association at a meeting, of which four weeks' notice shall be given. Three adverse ballots at the election shall constitute a rejection.

ARTICLE XX.

Initiation Fees and Dues.

The initiation fee shall be ten dollars; quarterly dues, two dollars; payable in advance.

ARTICLE XXI.

Alterations and Amendments.

All proposed alterations or amendments to the Constitution shall be submitted to the Association in writing, at a regular meeting and then lie over until the second meeting following. Due notice, containing copy of such alteration or amendment, shall be mailed to each member, at least one week previous to the meeting at which action is to be taken thereon. Such alterations or amendments must be sustained by a three-fourths vote of the members present.

ARTICLE XXII.

Quorum.

Fifteen members present at any meeting shall constitute a quorum for the transaction of the business of the Association.

BY-LAWS.

ARTICLE I.

Time of Meetings.

The regular meetings of the Association shall be held on every Friday evening. Special meetings may be called by the President or Executive Committee, or at the written request of five members. The hour of meeting shall be 8 o'clock, P. M. The quarterly meetings shall be held on the first Fridays after the first Mondays of the months of January, April, July and October. The annual meeting shall take place at the first quarterly meeting of the year.

ARTICLE II.

Order of Business.

After the meeting has been called to order by the presiding officer, the following order of business will be observed:

1. Calling of the roll of officers and standing committees. Absences will be noted by the Recording Secretary.
2. Reading of the minutes of previous meeting.
3. Collection of dues; this order of business may be proceeded with at any time during the evening.
4. Reports of standing and special committees.
5. The election of officers and committees on the first Friday after the first Monday in January, as provided for in Article III of the Constitution.
6. Unfinished and miscellaneous business.
7. Communications.
8. Proposals for membership.
9. Election of new members.
10. New business.
11. Adjournment.

ARTICLE III.

Order of Debate.

While a motion is under debate another motion shall not be entertained, unless it shall be:

1. To lie on the table, upon which the question shall be taken without debate.
2. To amend.
3. To reconsider.
4. To substitute another proposition.
5. To move the previous question, which shall cut off all debate, if carried.

ARTICLE IV.

Trial of Members.

If a member be charged with violating any article of the Constitution or By-Laws, or, conduct unbecoming a gentleman, or prejudicial to the welfare of the Association

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

268,584. SEWER-GAS TRAP. MOSES T. WILLIAMS, Riverside, Conn. Filed Sept. 7, 1882. (No model.) Issued Dec. 5, 1882.

Claim.—In a sewer-gas trap, the combination, with the trap A, provided with a seperable cover, B, and divided into three compartments by the upper and lower partitions, E F, of disinfectant vessels G H, substantially as herein shown and described, whereby sewer gas passing through or generated in the trap will be prevented from entering the building, as set forth.

268,663. WATER FITTINGS. JOHN R. HARGREAVES, Haslingden, County of Lancaster, England, assignor to Thomas Duckworth, Waterford, near Manchester, England. Filed July 31, 1882. (No model.) Patented in England Nov. 23, 1881, No. 5,111. Issued Dec. 5, 1882.

Claim.—The combination of a compound valve and a water boiler, with a cold water supply pipe leading to the boiler through passages in said valve, and a hot water distributing pipe leading from said boiler, and having an outlet through said valve, all substantially as described, whereby on the opening of the valve cold water will be admitted to the boiler as the hot water is withdrawn.

268,740. FLUSHING-BASIN FOR WATER CLOSETS. BENJAMIN C. SMITH, New York, N. Y., assignor to Fred. Adee, same place. Filed Sept. 19, 1882. (No model.) Issued Dec. 5, 1882.

Claim.—1. A water closet basin constructed to deliver therein a main flushing stream or streams of water, and provided with an oblique passage or passages formed through the bottom wall of an annular channel or rim at the top of the basin to introduce a current or currents or water, and by such oblique arrangement of the passage or passages, deflect the water on the main flushing stream or streams to oppose or interrupt the course of the same through the basin, substantially as described.

2. A water closet having at its upper edge an orifice to deliver therein the main flushing-stream of water, and an annular channel or hollow rim, the bottom wall of which is formed with passages which extend through the said bottom wall in an oblique direction, substantially as described.

3. A water closet basin having at its upper edge an orifice to deliver therein the main flushing stream of water, and an annular channel or hollow rim, the bottom wall of which is provided with pairs of passages 7, each pair of which extends through said bottom wall in lines which diverge from each other toward the bottom of the basin, substantially as shown and described.

268,821. DUST AND SEWER TRAP. HENRY PENNIE, Brooklyn, N. Y. Filed March 10, 1882. (No model.) Issued Dec. 12, 1882.

Claim.—1. The combination of the conduit C, the valve E D, constructed substantially as described, the flange F, and the shield or hood H I, extending over the valve-joint, substantially as and for the purposes set forth.

2. The combination of the conduit C, the valve E D, constructed substantially as described, the beveled bearing-flange F, and the hood or shield H I, provided with a beveled or inclined upper surface and extending over the valve joint, substantially as and for the purposes set forth.

3. The combination of the conduit C, flanged at both ends, as shown, the valve E D, the beveled bearing-flange F, and the hood or shield H I, provided with a beveled or inclined upper surface, substantially as and for the purposes set forth.

4. A trap consisting of the pipe or conduit section C, provided with flanged ends, beveled flange F, and inclined hood or shield H I, cast in a single piece, and the valve D E, cast in a single piece, substantially as described, the pipe-section and valve being united by the valve rod or axle running through the strengthening band N substantially as and for the purposes set forth.

268,822. VENTILATION. WILLIAM A. PITT, New York, N. Y. Filed July 16, 1881. (No model.) Issued Dec. 12, 1882.

Claim.—1. In ventilating buildings, the combination of a foul-air shaft, extending into the cellar of the house and com municating therewith by means of an opening in the floor of the lower hall, with an air passage arranged in the floor of each hall communicating with the adjoining room and with the room below it, and with a propeller arranged within said shaft, whereby the heavy and vitiated air from the several rooms is discharged into the halls at the lowest level, and is drawn down and exhausted at the lowest point in the building, substantially as set forth.

2. In means of ventilating buildings, the combination and arrangement of an air-outlet provided in the floor of the room communicating directly with an opening in the floor of the adjoining hall, and a similar outlet provided in the ceiling of the room similarly communicating with the hall above, whereby the foul and superheated air from the top and bottom of the room may escape into the halls on the lowest level, substantially as set forth.

3. The combination of the shafts *c* and *g*, provided with the doors *p* and register-opening *i*, with the flues *ff* and connecting flue *n*, all arranged and operating in the manner and for the purpose set forth.

4. The combination of a fresh-air shaft and foul-air shaft, adapted to exhaust and discharge from the lowest point in the building, with a ventilating-dome provided with one or more valves, whereby a direct current can be induced from the top to the bottom of the house through the halls, substantially as described.

5. The combination of the foul-air shaft *g*, propeller *m*, register-opening *i*, and air-outlets *j k*, all arranged in the manner and for the purposes set forth.

6 In ventilating buildings, the combination of the supply and exhaust shafts *c* and *g*, propellers *e* and *m*, flues *ff*, outlets *j k*, and register- opening *i*, substantially as set forth.

7. The combination of the foul-air shaft *g*, register-opening *i*, outlets *j k*, and pipe *s*, substantially as and for the purpose described.

268,865. SEWER-GAS TRAP. HENRY R. CASSEL, New York, N. Y. Filed April 29, 1882. (No model.) Issued Dec. 12, 1882.

Claim.—A sewer-gas trap consisting of an exterior chamber, into which the induction and eduction pipes terminate, and of an interior cylinder of less height than the exterior chamber, said cylinder having a transverse diaphragm intermediately between the ends of the induction and eduction pipes, substantially as and for the purpose set forth.

268,878. PROCESS OF AND APPARATUS FOR DISTRIBUTING LIQUID FUEL IN CITIES. CYPRIEN M. TESSIE DU MOTAY, Paris, France, and EDWARD STERN, New York, N. Y., (Benjamin F. Lee, New York, N. Y., Administrator of said Du Motay, deceased;) said Stern assignor to Benjamin F. Lee, New York, N. Y., Ancillary Administrator of said Du Motay, deceased. Filed May 26, 1880. (No model.) Issued Dec. 12, 1882.

Claim.—In combination with a central reservoir and a series of distributing-pipes conveying liquid fuel to the different houses of a city or town, apparatus arranged in the different houses for vaporizing each a portion of said liquid fuel, and a pump and pipes for returning the heavier portions of said fuel to the general circulation, substantially as set forth.

2. The combination, in a town heating and lighting system, of a central reservoir of liquid fuel, a double series of pipes, one of which supplies the liquid fuel to the different consumers of the town, and the other of which supplies compressed air or gas, and carburetors at the different places to be heated or lighted, constructed to carburet the compressed air so delivered by means of the liquid fuel delivered by the fuel-supply pipes, substantially as described.

8. The method of supplying heating or illuminating gas to consumers in a city or town, herein described, which consists in supplying to each house the fuel in a liquid condition from a central source, and then carbureting air delivered in each house by said fuel, substantially as described.

268,860. SECONDARY BATTERY. ASAHEL K. EATON, Brooklyn, N. Y., assignor of two-thirds to William Wallace and Thomas Wallace, both of Ansonia, Conn. Filed Apr. 15, 1882. (No model.) Issued Nov. 28, 1882.

268,368. GAS-REGULATOR. GRIFFIN S. LACEY, New York, N. Y., assignor, by mesne assignments, to the American Gas Saving Company, same place. Filed Oct. 12, 1882. (No model.) Issued Nov. 28, 1882.

268,378. GAS-LAMP. RICHARD PINTSCH, JULIUS PINTSCH, and OSCAR PINTSCH, Berlin, Germany. Filed Apr. 15, 1882. (No model.) Issued Nov. 28, 1882.

268,384. STEAM TRAP. JAMES H. BLESSING, Albany, N. Y. Filed Oct. 19, 1882. (No model.) Issued Dec. 5, 1882.

268,389. MEANS FOR CARRYING AND CONDUCTING ELECTRIC WIRES. WILLIAM M. CONWAY, Baltimore, Md. Filed Feb. 9, 1882. (No model.) Issued Dec. 5, 1882.

268,411. MOVABLE DAM. ARTHUR KIRK, Sharpsburg, Pa. Filed May 31, 1881. (No model.) Issued Dec. 5, 1882.

268,412. SMOKE CONSUMER FOR FURNACES. THOMAS KIRKWOOD, Chicago, Ill. Filed Aug. 16, 1882. (No model.) Issued Dec. 5, 1882.

268,419. UTILIZING EXHAUST STEAM. HARVEY T. LITCHFIELD, Hull, and DAVID RENSHAW, Cohasset, Mass. Filed Aug. 3, 1881. (No model.) Issued Dec. 5, 1882.

268,428. FEEDING AIR TO FURNACES. CHARLES MCWILLIAM and EMILE LOISEAU, Montreal, Quebec, Canada, assignors to William Alexander Campbell and George Hutton Patterson, both of same place. Filed Sept. 15, 1882. (No model.) Issued Dec. 5, 1882.

268,429. STEAM BOILER AND OTHER FURNACES. WILLIAM J. O'NEAL, Cincinnati, Ohio, assignor of one-half to Joseph C. Boone, same place. Filed April 27, 1882. (No model.) Issued Dec. 5, 1882.

268,435. LIQUID PUMP. HERMAN F. SCHWUCHOW, Chicago, Ill., assignor to Edward T. Mason and Frank A. Bergman, same place. Filed April 20, 1881. (No model.) Issued Dec. 5, 1882.

268,467. TANK SPOUT. JACKSON H. DUNLAP, Turloch, assignor of one-half to William Wilkinson, Los Gatos, Cal. Filed Aug. 26, 1882. (No model.) Issued Dec. 5, 1882.

268,580. HEATING APPARATUS. CORYDON WHEAT and ALFRED CATCHPOLE, Geneva, N. Y. Filed March 15, 1882. (No model.) Issued Dec. 5, 1882.

268,581. PUMP. JOSIAH A. WHITMAN, Cranston, R. I. Filed Mar, 28, 1882. (No model.) Issued Dec. 5, 1882.

268,615. HEATING FURNACE. GEORGE R. BROWN, Corning, N. Y. Filed Aug. 23, 1882. (No model.) Issued Dec. 5, 1882.

RE-ISSUE.

10,255. STEAM PUMPING MACHINERY. WILLIAM E. WORTHEN, New York, N. Y. Filed Oct. 4, 1882. Original No. 192,042, dated June 12, 1877. Issued December 5, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an urban population of 6,337,972, their died during the week ending April 14, 2,924 persons, which is equivalent to an annual death rate of 24.0 per 1,000, a decrease from the preceding week, for which it was 24.9

For the North Atlantic cities the rate was 23.7; for the Eastern cities 25.1; for the lake cities 21·8; for the river cities 21.1; and in the Southern cities for the whites 17.8 and for the colored 38.7 per 1,000.

Of the whole number of deaths 34.2 per cent. were under five years of age, the proportion being as usual highest in the lake cities (40.0 per cent.), and among the Southern colored (40·7 per cent). Accidents caused 2.1 per cent. of all deaths.

Consumption caused 15.4 per cent. of all deaths, as against 13.8 per cent. for the preceding week. In the North Atlantic cities it caused 15.0; in the Eastern cities 16.5; in the lake cities 9.2; in the river cities 8.0; and in the Southern cities for the whites 11.7 and for the colored 20.0 per cent.

Diphtheria caused 2.5 per cent. of all deaths. In the North Atlantic cities it caused 1.9; in the Eastern cities 2.8; in the lake cities 4.2; in the river cities 1.2; and in the Southern cities 1.0 among the whites and none among the blacks.

Typhoid fever caused 2.2 per cent. of all deaths. In the North Atlantic cities it caused 3.2; in the Eastern cities 1,9; in the lake cities 1.1; in the river cities 5.1; and in Southern cities, among the whites 1.0 and among the colored 1.4 per cent.

Scarlet fever caused 2.9 and measles 1.2 per cent. of all deaths.

Pneumonia caused 13.4 per cent. of all deaths, the highest ratio being in the Eastern cities, where it caused 15.6 and the lowest, in the river cities, where it caused 10.5 per cent. In New York city it caused 18, and in Brooklyn 17 per cent. of all deaths.

BOSTON, MASS.—C. E. Davis, Jr., reports 26 new cases of diphtheria, 21 of scarlet fever, six of typhoid fever and one of small-pox.

Digitized by Google

PITTSBURGH, PA.—Dr. Wm. Snively reports two new cases of small-pox.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 28 new cases of scarlet fever and 16 of diphtheria, making 59 of the former disease remaining under treatment and 21 of the latter.

DETROIT, MICH.—Dr. O. W. Wight reports eight new cases of diphtheria and 18 of scarlet fever.

EVANSVILLE, IND.—In his report dated April 14, Dr. Charles E. Lining states that according to a census lately taken, by order of the Legislature, the voters in the city number 8,316, which would give a population of over 40,000.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports three deaths during the week, two of which were deaths of children. Cerebro-spinal meningitis is one of the causes specified.

PROVIDENCE, R. I.—Dr. E. M. Snow says in his report for the week ending April 14: "The number of deaths for the week was considerably less than for the week previous, but is still above the average for the city. The cases of typhoid fever, as well as the deaths, seem to be decreasing."

BALTIMORE, MD.—The annual death rate for the week ending April 14 was, according to the local health board, for the whole population, 21.23; for the whites 17.43, for the colored, 43.33 per 1,000. The number of deaths reported was 167; males 80, females 87; under five years 58, over 60 years 36. Violence caused three deaths, consumption 17, croup three, diarrhœa one, diphtheria nine, malarial fever one, scarlet fever five, pneumonia 19, bronchitis three, measles two, and small-pox seven.

NEW YORK LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports 11 admissions, three deaths and three discharges during the week, leaving 1,349 insane patients under treatment in the Asylum.

NEW YORK QUARANTINE.—During the week ending April 13 there were taken from 20 immigrant steamers nine cases of measles, two of scarlet fever, one of typhoid fever and one of small-pox. The small-pox patient (from the *S. S. Wieland*) was 22 years of age and had been vaccinated when 10 years old. The ship's surgeon vaccinated 853 persons on board, but only six of his operations were successful. These people were re-vaccinated at the quarantine station, and a communication was sent to the steamship company, illustrating by this the economy there is in efficient work in the matter of vaccination by the surgeons of vessels.

MICHIGAN.—Dr. H. B. Baker reports the prevalence of the following diseases during the week ending April 7: rheumatism, neuralgia, bronchitis, consumption, intermittent fever, influenza, and pneumonia. Diphtheria was reported present at 13 places, scarlet fever at 18 places, and measles at 24 places.

HUDSON CO., N. J.—The report of C. J. Rooney, Jr., for the week ending April 7, came too late for insertion in our table. Deaths from all causes, 105; deaths under five years, 40; accidents two, consumption six, croup two, diphtheria two, typhoid fever one, scarlet fever eight, pneumonia 23, acute bronchitis 3, pleurisy one, puerperal diseases eight, and whooping cough one.

C. J. Rooney's report for the month of March, which will be tabulated hereafter, shows that the county death rate, 24.4, is one-half of one per cent. higher than the average of March during the six preceding years. The rate, however, has been very variable, ranging from 19.6 in 1878 to 31.3 in 1881. The increase is equivalent to about one hundred deaths per annum, and it occurred among persons over five years of age. No one cause was especially prominent. Croup, diphtheria, scarlet fever and consumption gave higher figures than their averages.

SAN FRANCISCO, CAL.—Dr. J. Hoesch, Secretary Board of Health, reports 86 deaths for the week ending March 31. Of these, 22 were of children under five years of age. Accidents caused four of the deaths, consumption 15, croup one, diarrhœal diseases four, typhoid fever two, pneumonia nine, acute bronchitis two, and puerperal diseases three.

During the month of February there were 399 deaths as against 509 during the corresponding month of 1882; males 260, females 139; under five years, 86; over 60 years, 57. Population, stated according to 1880 census, Caucasians 212,520, Chinese 22,000; total, 234,520. Croup caused five deaths, diphtheria one, diarrhœal diseases seven, erysipelas four, puerperal fever five, typhoid fever six, malarial fever two, consumption 85, bronchitis 14, congestion of lungs three, pneumonia 60, and violence 16. No death is recorded from cerebro-spinal meningitis, measles, whooping cough or small-pox.

NEW ORLEANS, LA.—The Board of Health report for the week ending April 7 has just been received. The present estimated population is given at 223,555, of which number 163,606 are white, and 59,949 colored. The deaths numbered 196; white 102, colored 94; under five years, white 28, colored 29; annual rate for the whites, 32.42; for the colored, 81.54; for the whole population, 45.59.

White: Small-pox caused 32 deaths, scarlet fever two, typhoid fever one, malarial fevers two, diarrhœal diseases one, consumption eight, croup one, pneumonia four, and violence two.

Colored: Small-pox caused 54 deaths, or 57.4 per cent. of the total mortality, malarial fevers two, consumption six, bronchitis three, pneumonia four, diarrhœa one, and violence two.

ONTARIO, CANADA.—The *Provincial Bulletin* for the week ending Apr. 7, shows the prevalence of bronchitis, influenza, measles, neuralgia, anæmia and intermittent fever. Measles has receded considerably during the week. Anæmia, which appears so frequently in this *Bulletin*, is defined to be "a condition in which, while there may be no actual localized disease, there is yet a general debility arising from impoverished blood, which places the system in a position peculiarly susceptible to any *specific* morbid influences to which it may at any time be subjected. The influence of unsanitary methods of living—as improper food, impure water and unventilated dwellings—in producing this condition has been so clearly demonstrated that the attention of the general public cannot be too frequently called to the fact, inasmuch as it is often the first stage, followed by some zymotic or other specific disease, too frequently of a fatal character."

ENGLAND.—The Registrar General's return for the week ending March 24, a summary of which was tabulated in our issue of last week, gives 26.1 as the average annual rate of the 28 great towns. The lowest rate was registered in Derby, viz., 18.9, and the highest in Hull, viz., 32.9. No death was referred during the week to any of the principal zymotic diseases, either in Derby or in Huddersfield. The highest rates from whooping cough were in Hull and Bolton, from scarlet fever in Leeds and Sheffield, and from measles in Norwich. Small-pox caused three deaths in London, four in Newcastle-on-Tyne and one in Leeds.

LONDON.—Births 2,466. Deaths 1,887. The births were 314 below and the deaths 56 above the average numbers in the corresponding periods of the last ten years. Annual mortality rate 24.9. Small-pox caused three deaths, measles 36, scarlet fever 29, diphtheria 14, whooping cough 32, typhus two, typhoid fever 14, and diarrhœa and dysentery 18.

The English returns for the week ending March 31, shows that the average rate in the 28 large towns increased to 29.2. Bradford recorded the lowest rate, 21.1, and Manchester the highest 39.8. No death was recorded in Norwich from any of the principal zymotic dieases. Hull Plymouth and Leicester gave the highest rates from whooping cough; Sheffield and Leeds the highest from scarlet fever; and Sheffield and Manchester the highest from measles. Small-pox caused one death in Sunderland, but not one in any of the 27 other towns.

SCOTLAND.—Consul A. J. Leonard, of Edinburgh, sends the return of the registrar-general for the week ending March 31st. The death rate in the 8 principal towns was 30.4 per 1,000, or 8 4 above that for the corresponding week of last year, and 2.0 above that for the previous week of the present year. Edinburgh presented the lowest rate, viz., 20.7, and Greenock the highest, 38.5. Whooping cough was the most fatal epidemic.

EDINBURGH.—Total mortality, 94; rate, 20.7. No death was registered as caused by small-pox or scarlet fever. Measles caused 1 death, diphtheria 4, whooping cough 4, typhoid fever 2, diarrhœa 1, acute lung diseases 29, and violence 5.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return the registrar-general for the week ending March 24, for which see table above.

DUBLIN.—Total mortality, 258; rate, 38.4; small-pox, scarlet fever, and diphtheria none, measles 1, typhus 8, whooping cough 11, typhoid fever 4, diarrhœal diseases 6, consumption 36, acute lung diseases 69, and violence 8.

BELFAST.—Total mortality, 117; rate, 28.4; small-pox, typhus, typhoid, diphtheria, and violence none, measles 1, scarlet fever 8, whooping cough 3, diarrhœal diseases 2, consumption 12, and acute lung diseases 39.

The return for the week ending March 31 has also been received.

DUBLIN.—Total mortality 279; rate 41.5; small-pox, measles, scarlet fever, and diphtheria caused no deaths. Typhus fever caused 8 deaths, whooping cough 14, enteric fever 3, diarrhœa 4, consumption 32, acute lung diseases 74, and violence 3.

PARIS, FRANCE.—During the week ending March 29 there were 1,303 deaths in Paris; males 723, females 580; under five years 391, over 60 years 288. Annual rate 30.23. Typhoid fever caused 30 deaths, small-pox 12, measles 41, scarlet fever 3, whooping cough 11, croup and diphtheria 40, dysentery 3, erysipelas 6, puerperal infection 4, consumption 260, acute bronchitis 45, pneumonia 128, and violence 28.

There remained under treatment in the hospitals on March 25, 110 cases of small-pox, 252 of typhoid fever and 34 of diphtheria.

RHEIMS, FRANCE.—Consul John L. Frisbie sends report for the week ending March 24, showing a mortality of 59; under five years 21, over 60 years 13. Annual rate 32.70. No death was registered as caused by small-pox, whooping cough scarlet fever, erysipelas, or violence. Croup and diphtheria caused 5 deaths, measles 2, typhoid fever 1, bronchitis 9, pneumonia 4, consumption 10, diarrhœa 1, and puerperal infection 1.

Consul Frisbie states that the sanitary condition of the city is good, and that the authorities take a commendable interest in its improvement. Pulmonary diseases have been very fatal, owing to the unusually cold and wet season.

BRUSSELS, BELGIUM.—In the city and its suburbs there were 204 deaths during the week which ended March 24; under five years 86. Annual rate 23.8. Small-pox caused one death, measles four, scarlet fever two, typhoid fever two, croup three, whooping cough two, diarrhœa and dysentery 21, bronchitis and pneumonia 39, and consumption 28.

COPENHAGEN, DENMARK.—There were 122 deaths during the week ending March 20, of which 56 were of children under five years, and 24 of persons 60 years and upwards. This mortality is equal to an annual rate of 24.76 per 1,000. No death was registered from small-pox, measles, croup, typhoid fever, erysipelas or puerperal fever. Scarlet fever, diarrhœa and diphtheria caused one death each; whooping cough nine, consumption 19, pneumonia 10, bronchitis 10, pleurisy one, and violence two.

During the same week the following cases were reported: small-pox one, measles three, scarlet fever 18, diphtheria 10, croup three, whooping cough 63, typhoid fever seven, diarrhœa 71, erysipelas 22, bronchial catarrh 400, pneumonia 52, and quinsy 142.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits the report for the week ending March 17, showing 109 deaths, equal to an annual rate of 32.6 per 1,000; males 52, females 57; under five years 49, over 60 years 19. Measles caused four deaths, scarlet fever one, whooping cough one, croup and diphtheria seven, typhoid fever one, diarrhœa six, consumption 16, pneumonia 15, bronchitis eight and violence seven.

(Continued from page 491.)

in any respect, his case shall be submitted to the Executive Committee, which shall render its decision to the Association, and if he should be found guilty by a majority of said committee, he may be censured, suspended, or expelled by an affirmative vote of two-thirds of the members present.

ARTICLE V.

Notice of Charges.

No member shall be tried upon any charge without having had mailed to him a copy of the same at least ten days prior to the investigation.

ARTICLE VI.

Dropping from Roll.

Any member in arrears on the books of the Association for twelve months shall have no voice or vote at any meeting until the liability be settled, and may be dropped from the roll by a majority vote of the members present, if due notice of his indebtedness shall have been served upon him one week prior to such action.

ARTICLE VII.

Resignation of Members.

Resignation from membership shall be made in writing and be addressed to the President, who shall refer it to the Financial Secretary. No member shall be considered as having resigned unless he has paid his dues in full to the Association, and given proper notice to the President as before mentioned.

ARTICLE VIII.

Re-instatement of Ex-Members.

Persons who have resigned from membership or whose connection with the Association has been severed from any cause whatsoever, can only be re-instated by compliance with Article V. of the Constitution.

ARTICLE IX.

Change of Business Location.

Members are required on changing their places of business to notify the Secretary within a reasonable length of time.

ARTICLE X.

Rights of Members in Work.

No member of the Association shall complete any work undertaken by another member without the consent of the latter, or the approval of a committee to be appointed by the President for that purpose. Nor shall any work be appraised—whether finished or unfinished—in the absence or without the consent of the party originally interested.

ARTICLE XI.

Employment of Apprentices.

No member shall employ any helper or apprentice who has previously worked for another plumber, without the written recommendation of the latter.

ARTICLE XII.

Vacancies in Offices and Committees.

Any officer or member of a standing committee of the Association absenting himself for two months in succession, except in case of illness or other valid reason, shall have his position declared vacant by the Executive Committee, and it shall be filled as provided for in Article XV. of the Constitution.

ARTICLE XIII.

Speakers' Limits.

No member shall be allowed to speak more than once on any question, or at a greater length than five minutes, if objection be raised.

ARTICLE XIV.

Suspension of Constitution or By-Laws.

Any article of the Constitution or By-laws may be suspended during the meeting by unanimous consent.

ARTICLE XV.

Alterations and Amendments.

Any alteration or amendment to the By-laws may be effected according to the method prescribed in Article XX. for alterations or amendments to the Constitution.

ARTICLE XVI.

Parliamentary Usage.

The meetings of the Association shall be conducted according to parliamentary usage, as laid down in *Cushing's Manual.*

FOURTH ANNUAL REPORT OF THE STATE BOARD OF HEALTH, LUNACY AND CHARITY OF MASSACHUSETTS. Boston, 1883. CXCIX. 104, 174 pp., 8vo.

This volume contains an interesting historical summary of the organization of the Board with an appendix containing the statutes relating to health, lunacy and public charity, and the decisions of the Supreme Court of Massachusetts relating to the same, forming a manual for the use of the boards of health and overseers of the poor of the State.

The greater part of the report is occupied with matters pertaining to the charities of the State and the care of the insane. Eighteen pages are devoted to the subject of public health. As regards small-pox it is stated that "the presence of small-pox in Massachusetts is due to three distinct causes: contagion from immigrants at our ports, paper rags, and the Canadian immigration by land. During the past year we know of its appearance in thirty cities and towns, but in three places only did it make serious headway, and even there it was checked after fifty or sixty people had been attacked. The sum paid or due by the State from the cases originating from this source alone for the past year will not fall short of $9,000, and may exceed that sum." The whole number of cases in the State was about 400 and the number of deaths 36. The disease appears to have been promptly and efficiently dealt with wherever it made its appearance, and the Board has good reason to congratulate itself and the State upon the results obtained.

As regards questions of public water supply, it is remarked that the attempt to secure definite information as to the water supplies of the State by means of circulars sent to the various cities and towns has not been attended with success, which is by no means surprising. It is also stated that "this Board has been anxious to make a very thorough study of the various forms of vegetable and animal life found in fresh waters. * * * Such study invokes the co-operation of a number of persons of peculiar scientific training, and the Board has not yet succeeded in finding them." We "deeply sympathize" with the anxiety of the Board on this subject, and hope that the health of its members has not been injured by their fruitless efforts to find men competent to make such investigations.

Attention is called to the evils of overcrowding, more especially in tenement houses, and it is recommended that there should be a general law on the subject, applicable throughout the State, similar to that now in force in the City of Boston, but with such modifications as the experience of this and other countries may suggest.

The appendix of statutes and decisions, forming a manual for the use of boards of health, is a convenient and useful compilation, with a good index.

On account of the reported existence of yellow fever in Cuba and other southern islands, the National Board of Health has decided to establish quarantine stations on the Southern coast earlier than usual this year.

Persons who feel friendly to this journal can do it a service by examining its advertising columns, and, whenever they see anything of interest there, by mentioning the paper when they write to the advertiser

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED.)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat.) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves

—SAMPLE ORDERS SOLICITED.—

THE "ECLIPSE"
Hand Pipe-Cutting Machine.

THE "ECLIPSE" HAND PIPE-CUTTING AND SCREWING MACHINE will be found a very convenient and efficient substitute for the heavy and costly Power-Machines usually employed to cut the larger sizes of Wrought Iron, Steam, Gas and Water Pipes.

While it is substantially built, and designed to work easily and without strain on any of the parts, it is at the same time very compact and portable.

It will cut off and thread 2½, 3, 3½ and 4 inch Pipes, and is so powerfully geared that a stout boy can easily cut and thread 4-inch Pipe with but a 12-inch Crank.

PIPE-FITTERS AND INDUSTRIAL ESTABLISHMENTS, who have occasion to cut Pipes within the range of the "ECLIPSE," will find it a most convenient and labor-saving tool, and as such we invite their attention to it.

We have in course of manufacture, and will soon place upon the market, another size "ECLIPSE" HAND PIPE-CUTTING MACHINE, *to cut pipes from ¼ to 2 ins. inclusive.* This machine will be very light, convenient, and in every way well adapted for Pipe Work of these sizes, and will be sold at a price within the reach of any one having use for such a tool.

Address, *PANCOAST & MAULE,*
243 and 245 South Third Street, Philadelphia, Pa.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

MEYER, SNIFFEN & CO.'S

No. 1

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER

WATER-CLOSET.

With the Cistern from which it is supplied, a pair of Brackets, the Floor Lever Chain and necessary fittings, except the lead pipe and trap.

The names of some of the parties using them and those having them for sale with full descriptive circulars, will be mailed on application to us.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly three years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADES HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),
17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,
Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

Trade Mark registered in the Patent Office, Washington, D. C., February 12th, 1878.

VOLUME 7. NUMBER 22. | NEW YORK, MAY 3, 1883. | SINGLE COPIES 7 CENTS. *Price of Single Copies more than one week old dependent on number on hand.*

Entered at the Post Office at New York, N. Y., as second-class matter.

THE SANITARY ENGINEER, *conducted by* HENRY C. MEYER, *is published every Thursday, at* 140 *William Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.*

TERMS, $3 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN: 16 CHARING CROSS, LONDON.

E. & F. N. SPON, Agents.

TERMS 16*s.* 6*d.*, PER YEAR, IN ADVANCE. *Postage Paid.*

CONTINENTAL SUBSCRIPTIONS RECEIVED BY

F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany.

Subscriptions to the Continent of Europe and Australia, $4; China, Japan, Sandwich Islands, Mexico and Cuba, $4; South America, $5.

NOTE.

Persons in any of these countries can send us the subscription price, by calling at their Post Office and leaving with the official the equivalent in their own money, for which he will give them what is called a "Post Office Order," which, if enclosed to us will be paid by our Post Office, the same as a draft when presented by us.

Fractional parts of a dollar may be sent in postage stamps.

Subscribers will please notify us of any failure to receive the paper, and also of any change in their address.

For Advertising Rates see last page.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

SANITARY LEGISLATION IN NEW JERSEY.

We print elsewhere copies of recent sanitary legislation in New Jersey, from which it is evident the State Board of Health has a very considerable influence in the Legislature of that State. This is as it should be, and we congratulate the Secretary of the Board, Dr. Hunt, upon the fact.

To what extent these laws can and will be executed is, of course, uncertain. There is no doubt that cigarette smoking is injurious to boys, but we shall be surprised to hear of any convictions under the law as it is framed, and we very much doubt the practical utility of legislation of this kind. How can it be proven that the dealer knew the boy's age, unless it was his own son! We are glad to learn, though, that the State Board are in no way responsible for this measure.

The bill giving supplementary powers and duties to local boards is one of which it is very difficult to judge, as it turns largely upon technicalities of Jersey justice.

We have followed copy exactly in Section 6 of this bill, although the idea that a board of health should have authority given to it to prohibit a contagious disease is something new. Probably it was the public funeral which it was designed to prohibit, but to effect this the wording and punctuation of the law must be changed.

The law would seem to confer ample powers on local boards to suppress nuisances and to deal with contagious diseases. It gives such boards the authority at their option of enforcing compulsory notification of such diseases from physicians. This act carries out the principle of local government almost to an extreme, and a full and accurate report of the results obtained from it would be very instructive.

With regard to the supplementary act to prevent the adulteration of food and drugs, the close of the sixth section, which provides that the penalty shall be paid to the person bringing the suit, seems to be a very doubtful expedient, since it tends to create a class of professional informers who will bring the whole matter into discredit.

It is, moreover, not clear to us how Section 8 is to be carried out. Is any officer of any local board of health to have the power to stop the transit of any articles of food or drugs? According to this section, any such officer in New Jersey has power to inflict great annoyance and loss on merchants and on the great corporations for inland transportation whose lines cross the State.

The principle of this section is thoroughly bad. Honest and intelligent business men are willing to intrust a State Board of Health with great power, believing that it will be wisely used to protect, not only the health, but the commercial interests of the community, but will be very unwilling to have every county and township official intrusted with the same power under the stimulus of giving the fines to the informers.

If, moreover, the policy of the State Board of Health is to be that announced by its Secretary, as given in THE SANITARY ENGINEER of April 19, viz.: to pay no attention to commercial frauds, and to look only after adulterations harmful to health, then the honest manufacturers, dealers and consumers must seek protection from another organization, and in that case it will be the State Board of Health that will suffer.

It seems to us to be an exceedingly unwise policy on the part of State Boards of Health to attempt to shirk the responsibility placed in them by laws regulating the adulteration of food and drugs, and to confine themselves to the health aspects of the problem.

No doubt it requires tact, energy and courage to deal with fraud, but the Board which shows that it possesses these qualities can command the influence of honest business men, and that influence is omnipotent when brought to bear upon legislation.

Increased mortality among the insane in the Blockley Almshouse, Philadelphia, in 1882, soon led to a report by Dr. Richardson, physician in charge, to the Guardians of the Poor, in which he states that escape of sewer gas into the ventilators gave a typhoid character to all diseases. He reports that the sewage from nearly 100 persons was dumped into the cellar from which the air supply was drawn. He also found that the buildings were not properly warmed, the reason being that the boilers were in such condition that the inspector refused to permit a sufficiently high temperature to be carried to produce the necessary heat.

We should be glad to know who is responsible for this disgraceful condition of things. Have they another "Tewksbury" establishment in Philadelphia?

We print elsewhere a translation of a paper on the Separate System of Sewerage, by Prof. R. Baumeister, Professor of Civil Engineering in Polytechnic School of Carlsruhe, Germany, printed in the "Viertel Jahrschrift für Oeffentliche Gesundhietspflege." This is a valuable contribution to the subject, and we commend its perusal to our readers as the views of a gentleman who has evidently considered the question without bias.

The New York Board of Trade and Transportation, at a meeting held April 28th passed resolutions endorsing Mayor Edson's bill for the proposed aqueduct. The chairman was authorized to appoint a committee to go to Albany and watch the progress of the bill.

THE DIRECTION OF SANITARY WORK IN A GROWING COMMUNITY.

PORTLAND, OREGON, *April* 4, 1883.

To the Editor of THE SANITARY ENGINEER:

Portland, Oregon, is situated on the bank of the Willamette River, twelve miles above its junction with the Columbia, and 100 miles from the ocean. Its population is between 25,000 and 30,000, and is increasing very rapidly. The streets run parallel, and at right angles with the river. From the river the streets have a gradual rise toward the hills behind the city. Through the northern and lower part of the city run two creeks which are streams of pure water on entering, but in their passage through the city become open sewers. In the same part of the city is situated Couch's Lake, which although gradually being filled up, is at present, and especially at the lowest stages of water in the river, a stagnant swamp, covered with rank weeds, and poisoning the air with their noxious gases.

The only system of sewerage which the city has, is a series of sewers 18 or 20 in number, having no connection with each other, running down the streets at right angles with and into the river. They are all pipe sewers from 9 to 16 inches diameter. Yearly we have in June freshets, when the river sometimes rises 29 feet above low water, and at those times, for two months, the sewers are nearly all filled with water over half their length.

The greater part of the city is, however, outside of this sewerage system, and there the people have to depend upon cesspools which are dug down to a gravel or water bearing strata, to prevent them from filling up. I am very sorry to say, that in utter disregard of all sanitary laws, a large number of our inhabitants have wells, and use water for all purposes from the same source, well and cesspool very often only a few yards apart.

We have a private water company, which supplies very good water which is pumped from the river above the city, and away from all contamination with the sewers. This summer the works are to be extended with another pumping station ten miles further up the river. The health of the city is generally good, although we have sometimes slight epidemics of scarlet fever and diptheria.

We have no board of health or city engineer, but all ordinances in regard to health or drainage are left to the chief of police, or street superintendent to enforce. I anticipate your advice in matters of this kind, for the city to employ a first-class engineer to examine into and construct a system of sewerage best suited to our situation and requirements, but it is very hard to impress such upon our city fathers, so I hope by your making some comment on this letter they may be brought to see the error of their ways. Yours truly, W.

No rules of universal application are known to us by which a young, vigorous and growing community, which as yet has had but little sickness, and, in fact, does not recognize that it has any, can be induced to take timely measures to prevent soil and water pollution, until the evil results of neglect become so manifest in the form of disease and death, that they can be no longer ignored.

Nevertheless it is now, we think, in most cases, possible to get intelligent people to take an interest in the matter if one goes to work in the right way.

There ought to be little difficulty in getting fifty prominent citizens of Portland to form a citizens' sanitary association.

Let the objects of this association be to investigate the sanitary needs of the city, and to have given a course of ten lectures upon sanitary matters. The main thing is to make a beginning, the association will find plenty to study, and plenty to do, and its members will find the subject full of interest.

Let it be evident that the association does not exist for the purpose of grinding anybody's individual axe; that it does not start out with a fixed programme for reforming everything and everybody, but that it proposes to study the subject, obtain reliable information as to what is best to be done, and to endeavor to create an intelligent public opinion with regard to it.

One of the first things with regard to which information will be desirable is the amount and character of the diseases prevailing in different parts of the city, and the first step toward securing this is to establish a system of registration of deaths.

Such a system is necessary to prevent concealment of crime, and to ensure the means of proof of right to property; and there should be little difficulty in securing the passage of the necessary city ordinance to obtain it.

The essential principles of such an ordinance are simple and well known. No burial should be allowed without a permit from an officer of the city, and any attempt at a burial without such a permit should be regarded as furnishing good grounds for suspicion that the death was not due to natural causes, and as calling for a coroner's inquest.

Before such a permit is given a certificate should be required from the parent or householder giving the name, sex, age, residence, birth place, conjugal condition, occupation, residence, and place and date of death of the deceased, with a certificate from the attending physician as to the cause of death.

This registration of deaths is the foundation of sanitary work, and is the first thing to be secured.

It is unnecessary to indicate the various subjects which this sanitary association will find it expedient to investigate through committees and otherwise.

Undoubtedly the question of the disposal of sewage will be one of those, and, undoubtedly, also it will be highly desirable to obtain the advice of a skilled engineer upon this subject; but that will come in due time.

The first thing to be done is to get the intelligent thinking portion of the community, the successful business men, the physicians, editors, clergymen, lawyers, etc., etc., to look into this matter for themselves, and determine whether anything ought to be done. When they have looked into the matter, and become acquainted with the actual condition of things, and the probable results, the rest follows, as a matter of course.

Portland is too important a city, and has too much at stake to be without an intelligent active health officer, and no doubt, the sanitary association will so determine. But it is as well to have the educational process go on for awhile before such an officer is appointed.

Meantime we shall be glad to hear occasionally from Portland, and to learn that the question of prevention of disease has been considered by her citizens of sufficient importance to demand investigation.

Mr. Isaac G. Perry, of Binghamton, has been appointed by Governor Cleveland Commissioner of Construction of the new Capitol.

Dr. F. E. Englehardt recently submitted to the Syracuse Board of Health a plan by which he claimed the city could obtain a supply of pure milk. He would require each dealer to take out a license, costing him $5. This license shall contain full information regarding the number of cows supplying the milk, where kept, etc. He suggests that milk from different farms be sold from different cans; that the sale of skimmed milk be allowed, provided the cans containing it are properly marked; and that no dealer be allowed to sell milk from a farm on which a contagious disease has broken out. It is proposed to adopt the lactometer used by the Board of Health of this city.

The *Nashville American* suggests that in extension of water and gas pipes, they should be laid in the alleys through blocks instead of in the streets, and thus avoid the annoyance caused by "the street car companies, the gas company and the water works department digging up the middle and both sides of the street from the beginning to the end of the year."

The plan is well worth considering in towns which are laid out with alleys in the rear of the houses in every block, as so many southern and western towns are.

THE SEPARATE SYSTEM OF SEWERAGE.*

The drainage and sewerage of towns by means of underground conduits has up to the present time almost always been effected by delivering to such conduits *all* water to be removed, *i.e.*, waste water from households and manufacturing establishments, surface water from streets and yards, sometimes subsoil water, together with human excreta. The principle of the *separate system* consists in constructing a complete network of sewers (brick and pipe) for *household wastes only*, sometimes including excrements, while rain-water, snow, etc., are separately removed, partly on the surface, partly underground, the subsoil water being also separately carried off by means of drain tiles.

This principle was first carried out, although most always in a somewhat modified form, in a number of English towns, of which the more noted instances are Alnwick, Reading, Oxford, Dover. The rain-water, however, from roofs and yards is admitted into the system of waste water sewers, in order to flush it out occasionally, while the removal of surface water from the streets is mostly effected by open gutters. In Halstead the hydrants are connected with the upper dead ends of the sewer system in order to effect a *regular* flushing.

In America, too, it was at first supposed with regard to the separate system of sewerage that it would be inexpedient to exclude all rain water, since no artificial flushing could be as efficient as the occasional introduction of a large quantity of rain-water.† But the difficulty herewith encountered was overcome by the invention of Rogers Field's automatic flush-tank, which is placed at the upper end of all branch sewers, is fed from the public water supply, and can be utilized for the regular flushing at any desired interval of the whole system. In consequence of this invention the principle of the separate system was carried out with full force. The principal advocate of this system is Col. George E. Waring, Jr., of Newport, R. I., who has treated this subject in numerous articles, at public meetings, and in plans carried into execution.

Following this brief introduction the writer brings a detailed description of the Memphis sewerage system, which we omit as well known to the readers of THE SANITARY ENGINEER. Then follows a more critical examination into the merits of the separate system, as compared with the combined system, which, coming as it does from a reliable and fully impartial critic, well deserves our attention.

I. VELOCITY OF FLOW REQUIRED TO REMOVE DEPOSITS:

The quantity of sewage proper of a given area is so small as compared with the volume of water from heavy rainfalls (it varies from 1-5 to 1-30 according to local circumstances) that the cross section of *combined* sewers is utilized only little during dry weather. A shallow, sluggish stream of water moves along the sewer invert and is apt to deposit suspended matter and to create obstructions more or less large, which are readily increased, whenever a stoppage occurs anywhere, and which are removed only at the next rainfall. Meanwhile, of course, decomposition begins, which may be of little importance when a good ventilation of the sewers is provided; but, nevertheless, it is not the object of a good system to *store* waste matters in the sewers for any length of time. On the other hand, pipe sewers, intended to carry sewage *only*, are daily filled (at the time of the greatest consumption of water) to such an extent that the maximum velocity of flow is ensured, consequently deposits remain in these pipes for twenty-four hours only, provided the dimensions of pipes are well proportioned. In order to illustrate clearly this difference, the National Board of Health had a series of observations taken in various cities, on the dry weather flow of sewers of the combined system. I shall not repeat this bulky evidence, as professional readers will readily believe that the dry weather flow of even large urban districts covers the invert only a few centimetres deep, and could be carried by pipes of very small diameter when running full bore. But all the sewers experimented upon were *circular* in shape, in other words they did not have the most favorable cross section. If, on the other hand, we chose the *egg-shaped* section, its lowest part can be constructed the same or nearly the same as the lower half of a small pipe, consequently depth and velocity of the dry weather flow may be the same in either case. This has been done, for instance, with great success in the sewers of Mainz, Germany, where the lower portion of the egg-shape has a curvature of a *very small* radius.

Therefore, the claim of an advantage of separate sewers over combined sewers as regards velocity of flow is only true with regard to such combined sewers as are made circular on account of small size and for simplicity's sake. This is true ordinarily for sewers up to twenty inches diameter. Such a pipe is really less efficient in regard to removal of sediment, etc., than the pipe of the separate system, which would be only six or eight inches in diameter. But, even this difference ceases whenever artificial flushing arrangements are provided, for these do not permit deposits to remain in the pipes, and are used in every good system of sewerage, wherever the grades are flat.

The whole comparison is, in my opinion, therefore reduced to the fact mainly, that, supposing the same efficiency of flush for sewers of either system, separate sewers require *less amount of flushing water;* this fact may, occasionally, bear some significance, though often it is quite unimportant.

---

* From a paper by R. Baumeister, Professor of Civil Engineering, in the Vierteljahrschrift für Offentliche Gesundheitspflege.

2. CHARACTER OF THE SOLID WASTE MATTERS OF SEWERS.

Only *organic* waste matters are carried into the pipes of the separate system—except, possibly, some sand used in kitchen sinks for scouring vessels. Such organic matter has a small weight and is therefore easily carried away by the velocity of the current. Sewers of the combined system, on the other hand, receive *mineral* substances from streets, yards, roofs, together with straw, leaves, horse-dung, etc. It is a matter of common experience that even with the most carefully constructed catch-basins, and even where streets are frequently and thoroughly cleaned and swept, it is only possible to keep *coarse* matters out of the sewers, while a large amount of *fine* dirt matter is carried into them at each rainfall. While it is true that this very rain affords an opportunity for removing deposits from sewers, nevertheless much dirt is left behind on the sewer invert, and has to await removal until the next flushing, natural or artificial, occurs. Such deposits occur especially with sand, owing to its greater specific gravity; unfortunately they, in turn, cause accumulations of organic matters, carried along with the sand or following it, which soon undergo decomposition. While, therefore, deposits from rainfalls are not *per se* important as regards the origin of sewer gases, they are, without doubt, indirectly their cause. Excremental matters carried in a few hours through sewers to the outlet are harmless, but, if mixed with mineral deposits, they are dangerous.

If, for instance, a stream of 3 cm. depth in a separate pipe sewer suffices to carry with it all solid matters—a combined sewer may require a depth of water of 10 cm. for the same purpose. For this reason Col. Waring attributes to the separate system the advantage of greater cleanliness, and certainly he is, generally, right. *How* great this advantage in each case will be must depend entirely upon local circumstances. Where streets have a heavy traffic, and are insufficiently cleaned, and where, furthermore, the grades of the sewers are light, where the regular flushing is not very efficient, and where rain showers seldom occur, there the difference is great; under opposite circumstances the difference is only slight, especially with regard to the quantity of *sand for scouring*, which is also carried into separate sewers.

But, besides the advantage indicated, a *disadvantage* revealed itself at Memphis, namely, obstructions through larger solid matters, which find their way into sewers through carelessness, or maliciousness; for instance, bones, chips of wood, household tools, etc. In larger sewers such matters would be easier removed in suspension than in the small pipes of the separate system.

3. ACCESSIBILITY.

In order to clean and repair the ill-constructed sewers built in old times, it was deemed necessary to make them large enough to admit a man, at least in a crawling position. This would require large cross sectional areas, and the cost of building such sewers is great; therefore, this idea was soon abandoned in sewer systems constructed later, except where the calculation would at any rate require a large sectional area; no blame attaches on this account to the separate system, whose sewers will never require to be of a size capable of admitting a man. But in modern combined sewers *man-holes* are always constructed at fixed intervals, and the line of the sewer between two consecutive manholes is made straight, where possible; besides man-holes, *lamp-holes* are constructed in order to inspect, and, if necessary, clean sewers by the "pill" or a scraper. The fact that such inspection openings were omitted on all branch sewers at Memphis, has called forth many adverse criticisms towards this system. This, however, has evidently nothing to do with the *principle* of the separate system. Col. Waring has answered this criticism by claiming that the interest on the sum necessary to construct man-holes and lamp-holes would amount to much more than the cost of an occasional digging up. This may well be doubted. I learn that pipes, which had to be broken into at Memphis, are now *replaced* by special *hand-hole pieces*, with a cover, which is easily removed.* While it is true that by doing so, finally all pipes at Memphis may be made accessible, after reopening all pipe trenches in streets, this seems to me to be a rather strange method of procedure. At any rate such digging would cause much too great an inconvenience *to traffic* in those cities where sewers are located under *paved streets*, and here man-holes for the removal of occasional stoppages cannot well be omitted. Their distance may possibly be greater in the separate system on account of absence of dirt, consequently their *cost* may be *less*.

An advantage of the method of sewer construction followed at Memphis lies in the fact that all house-connections were built in at once with the sewer, thus dispensing with any future digging of streets, to connect houses to the sewer. But, this advantage, too, does not belong to the separate system *as such*, and cannot well be quoted as *counterbalancing* the annoyance of digging up the trench in case of stoppages; for a house-connection occurs only *once* in a certain spot, while stoppages may repeatedly occur.

5.—VENTILATION.

In sewers, which receive both household wastes and stormwater, a great *variation* in the depth of water occurs. At times of rain-storms they fill up quite high, running often nearly full, the walls are wetted by the sewage, and the moisture penetrates them to a greater or less extent.

* Report to the State Board of Health of New York, by James Gardiner.

In time of drought a small current only runs through the sewer, but the damp walls above the water-line offer conditions favorable to the growth of bacteria, which together with organic waste matters remain clinging to the walls, and are, morever, exposed to foul gases derived from decomposing deposits on the sewer bottom. Artificial flushing will seldom suffice in quantity and force, *thoroughly* to remove and scour away such dangerous matters; they consequently remain in the sewer until the next heavy rain occurs, and after each rainfall the same process occurs again and again. Two favorable circumstances protect our dwellings against micro-organisms thus generated in sewers: *first*, the *dampness* of the walls, to which they adhere, for a drying and consequent dropping off is likely to occur only at long periods of dry weather. Should, however, bacteria drop off and be carried along in sewer air, *water-seal traps* render their entrance into our dwellings impossible, and since traps may be relied upon in a well devised system of house drainage, a comforting feeling of safety is secured.

The advocates of the separate system contend that it would nevertheless be better to prevent the *formation* of micro-organisms, and it must be conceded that the conditions in this respect are more favorable in the small pipe sewers of the separate system. These have no great changes of the water level; the maximum water level occurs once every twenty-four hours, and a flushing occurs during the same interval, filling and scouring the whole cross sectional area of the pipe, moreover the area of walls is small with pipe sewers; and all this certainly does not warrant the expectation of a large and rapid growth of bacteria, etc. But, to call *on this account* all combined sewers a sanitary failure, and to consider the separate system the only system admissible, seems to me to be exaggerated.

Only a relative, not an *absolute* difference, exists between both systems, and so far as the safety of the population is concerned, this difference does not amount to more than that which exists between a wild animal confined in a cage, or not existing at all in a country.

If we further consider the *removal of sewer gas*, which possibly contains harmful micro-organisms, preference must, on the contrary, be given to *large* sewers. For, if we imagine a small and a large pipe provided with like ventilating openings, the movement of air will encounter *more* friction in the small pipe than in the larger sewer, consequently, the air in it will move more slowly, and possibly not at all. Those creeks, which have been arched over in many cities, and are now used as sewers, and the cubic contents of which are very large, enjoy the best change of air. In the American pamphlets, of which I have copies, it has been said—and certainly it is proper to say so—that the Memphis sewers have been used for two years, and have been repeatedly examined and found to be free from sewer gas. Since they carry household waste matters they are said to have a disagreeable odor, but one not by any means as disgusting and vile as that of a common sewer. In other words, it is claimed that the ventilation of separate sewers is much more efficient than that of sewers hitherto usually constructed! This assertion I consider to be *wrong*, and such a claim reminds me of comparisons between incommensurable matters such as may, unfortunately, be found quite often in the literature on the disposal of town sewage. The above sentence, to be correct, should read as follows: A well ventilated small pipe is better than a poorly ventilated larger one; this nobody will doubt. Little care, indeed, often much to little, has been hitherto bestowed upon the proper ventilation of a system of sewers. The perfect arrangements adopted at Memphis, cannot, however, be attributed to the separate system as such, but may be equally well adapted for large sewers;* and as they may act even more efficiently with such, the above *objection* on account of bacteria is also entirely removed. With a construction and details worked out with equal care, large sewers cannot be considered essentially inferior to sewers of the separate system.

6.—REMOVAL OF STORM WATER.

Col. Waring attributes many sanitary disadvantages, to the hitherto usual method of removing the rain-water in deep subterranean channels, which at the same time receive sewage waters. He claims that the gullies, which should not only retain suspended earthy and organic matters, but should also keep back sewer gas, are not capable of performing this duty. At times of light rain storms, it is true, dust remains at the bottom of gullies, and clarified water runs off into the sewer; but water from heavy atmospheric storms arrives at the catch-basins so very turbid, and has so little time for settling of heavier matters in the gully, that most of the suspended matters enter the sewer, and give rise here to the evils spoken of heretofore. In gullies, too, the solid matters, which may settle at the bottom, accumulate, begin to decompose, send out vile emanations and annoy thereby the people passing on the sidewalk, moreover, the water in the catch basin, may entirely evaporate during periods of draughts, the waterseal is lost, and sewer gas is allowed to escape.

There can be no doubt about the existence of the evils just mentioned. But such objections should be raised not against the system of sewerage, but against the deficient cleaning of streets and gullies, or, if one choose, against the considerable amount of labor required to keep the whole in order. It is the system of street cleaning in American cities, which is far from satisfactory, as Col. Waring himself admits. It would be considered an extraordinary negligence, according to our ideas, if dirt would be allowed to accumulate in a gully so much that its decomposition could not be checked by a covering of water.

* As for instance, in the Sewerage Project for Königsberg, Prussia.

Let us now inquire, how rain-water is removed in the separate system. As the temporary presence of rain-water on the surface may be considered unobjectionable from a sanitary point of view, it is recommended to construct *open gutters* of large cross sectional dimensions and for such distances as may seem admissible with regard to street traffic; eventually the gutters may be covered, but should be left accessible for cleaning purposes. This, of course, gets finally impossible with increased traffic, in main thoroughfares, which have already received the water from several side streets, and sometimes with regard to adjoining property, it becomes necessary to lay the channels for rain *underground*. But their *depth* below the surface will not be greater than the grade and the precaution against frost demand; generally it may be *less* than the depth of sewage pipes and subsoil drains. Otherwise, the constructive details will remain similar to those of our combined sewers, since we could not and would not wish to dispense with requirements such as proper cross section, impermeability, smoothness, strength to resist the pressure from the street traffic, accessibility, by means of manholes, waterseal traps in the catch basins, etc.

The system described presents, in fact, technically nothing else than the rudiments of *any* system of town drainage; one tries to get along with open gutters as long as possible, and is finally forced by considerations regarding the traffic to construct *underground* conduits. But in a sanitary and æsthetic point of view, there is this difference that in the new system we have to do only with comparatively pure storm water, while it was customary (and I regret to say that it is so even now) to carry household wastes to the gutters, which would create nasty deposits and exhalations.

If we now make a *comparison* between the combined sewerage and the separate removal of storm water in open gutters (as long as such are feasible), it is evident that the latter method has the advantage that the storm water is more efficiently used in flushing gutters, and on the other hand the disadvantage that the convenience of the traffic suffers.

Col. Waring regards the latter as unimportant, as the break of the street surface by large gutters is more disagreeable than dangerous, and because an occasional overflowing of the street by a heavy shower is more endurable than bad emanations from catch basins. It is true that in our (European) sewerage systems extravagance sometimes prevails, and that small towns and distant and out-of-the way streets are at once provided with underground sewers, while they could have removed storm water for a long time on the surface, but underground sewers are required on account of the sewage, and so it became customary to take the rain into the same channels.

On the other hand, it appears to me that the labor required to clean streets cannot be reduced by the separate system. For, under any and all circumstances, it is desirable to allow as little as possible of the dirt from the street to get into underground sewers, because to lift and remove it out of sewers costs more than to cart it away before it gets into the sewer. It would seem to me to make little essential difference, whether a certain volume of dirt was removed from the surface of the street, from gullies. or from gutters.

7.—COST.

It is a well-known fact that the large cost of a sewerage system, intended to carry off both rain water and sewage, often discourages communities from taking measures for a systematic method of sewerage and drainage. It is immaterial for the above whether human excreta will be removed by water carriage, or by one of the dry-methods of removal, as the cost of sewers is independent of it. In small towns in particular, in scattered built-up blocks or suburbs, and in proposed streets, the construction of large sewers is difficult, since it puts a heavy burden upon the community, or else requires large contributions from, or assessments upon property owners.

It cannot, in my opinion, be *generally* decided whether or not the separate system reduces the cost of construction; this can be done only after consideration of the conditions of each *special* case. Nevertheless, it is possible to group such cases, and to make, based upon this, a few general estimates, such as the following:

(*a*) Where a town extends along a natural watercourse, and has wide cross-streets running to the water with a good grade, storm water may entirely run off in surface gutters. These may possibly require to be covered up at street crossings, or at certain other points. The underground work is, in such a case, reduced to a system of separate sewers for sewage only, to which is eventually added a system of subsoil drains. In such a case the cost of the system is much *smaller* than that of a combined system, and some American assertions may be true, that the former is only *one-fifth* of the latter. Such conditions prevail not only at Memphis, but in other American cities, which have been located along the banks of a river. In older cities of a like character, for instance, at Lubeck (Germany) the width of streets is insufficient; but there are numerous small towns the sanitary condition of which might be largely improved at a moderate cost by such a system.

(*b*) Where towns or cities are situated similar as described above, but where the storm water must be carried off *below the surface*, either out of consideration for the traffic, or on account of insufficient grade of streets, the separate system may still offer financial advantages. For channels for rain water may be run by the *shortest way* to the river, hence they require but small sizes, and moderate depth below the

Digitized by Google

surface, while a combined system would ordinarily require the construction of large and deep *intercepting sewers* parallel to the river, in order to avoid the location of the outlet within the city, or sometimes to avoid it entirely. Moreover, many cities have creeks, which are left open or else arched over, and are unobjectionable from a sanitary point of view as rainwater channels, and may be economically utilized for such a purpose, while, as is well-known, these same arched brooks, converted into channels for *rain and sewage* have, in many cities, become great nuisances and had, consequently, to be abandoned. Therefore, the separate system may be recommended for many cities which can get rid of the rain-water by means of open or covered gutters, short underground conduits and natural watercourses, although the opinion of an American Engineer, that it would cost *one-half* of a combined system, appears to be worthless on account of its generality. Even in a place which has been only partly or unsatisfactorily sewered the question seems proper, whether or not the existing sewers may be used for rainwater only in future, while a new system of separate sewers should be built for sewage.

(*c*) Let us further consider a city which *lacks facilities for surface drainage;* under such circumstances the adoption of the separate system necessitates the construction of one system of sewers for sewage, of another for storm-water, and possibly of a third system for subsoil drainage, and this some opponents of the separate system have rashly considered to be the *bête noir* (Schreckbild) existing *in all cases.* The total cost will, in such case, *exceed* that of a combined system, but *not very largely,* since rainwater conduits may be laid close to the street surface, and because both systems may be constructed simultaneously. It is impossible to estimate, in a general way, the difference of cost; the American supposition of 25 per cent. appears to be rather a rough guess. But it should be remembered, that in many cases the costly construction of such a system *inside* of a city may be largely counterbalanced by saving in cost *outside* of it; and this is especially true where the contents of deep sewers must be raised by *pumping,* and where *sewage must be purified* by irrigation or otherwise. How much may dimensions of pumps, outlet sewer, clarifying basins, irrigation areas be reduced, if *sewage* only has to be handled; how economical and regular may the operation and management of pumps and irrigation fields be organized, where no unusually large quantities of sewage have to be taken care of, which are of no agricultural value for purposes of irrigation.

(*d*) I finally mention the possibility of *combining in one city both sewerage systems,* not only by treating different sections of a town *independently* of each other, the one by the combined, the other by the separate method, but also in such a way that the two systems may be actually *connected.* This may be done as far as the *locality* is concerned, side by side, or as regards *time,* successively. In the first-mentioned instance, certain streets or districts are provided with combined sewers, which also receive the separate sewers of other streets or districts; the storm-water of the latter may, under circumstances, run in the same direction, but should be, if possible, carried off independently. Naturally, the combined system would be adopted, principally for low-lying, densely populated districts, which possibly have already been provided with sewers, and also for the principal streets and thoroughfares, while the separate system is more suitable for high-lying, more widely built, out-lying districts, and also for by-streets. In what way and to what extent the two systems may touch or penetrate each other will depend entirely upon local circumstances, and should be decided in each case by comparative estimates of cost (for instance: Danzig and Königsberg).

Then, again, the two systems may follow each other as regards *time:* first, a separate system of sewers for sewage might be constructed with surface removal of storm-water, and it might be contemplated to substitute instead of it, with increased traffic and more densely built-up blocks, combined sewers. The object in doing so would be this, that by adopting first the cheaper system, sufficient interest on the working capital may be saved until the time of change to cover the cost of the first system, or even to save a surplus. Whether or not this would be the case, should, of course, be determined by careful comparative estimates of cost, and by estimates of the growth of the city. Generally, such a course should be well considered, especially in suburbs, or districts expected to grow, in order not to increase too much the assessments upon property-owners, and in order to favor the construction of the system by intervals, according to needs.

CONCLUSIONS.

To sum up the above considerations, we find the separate system to be a highly important departure of sewering cities, which is capable of the most varied application for new projects, as well as for towns already partly sewered, and for newly laid out suburbs. Some good details of design and construction, such as are found in the separate systems actually built in the United States of America, may be equally well applied to combined sewer systems, and may be partly seen in actual use in the best systems constructed in Europe.

The *fundamental idea* of the separate system, *i. e.*, separation of sewage from the rain-fall, offers not only hygienic, but in many cases, financial advantages as well, but causes certain inconveniences to the street traffic. The latter may, under certain circumstances, prohibit its adoption from the beginning.

Otherwise, the *sanitary advantages* as compared with the combined system, are *not,* in my judgment, so great that they should decide the question. The latter is much rather of a *financial character,* and one in which both cost of construction, and cost of maintenance and operating expenses should be jointly considered.

Wherever the separate system would *cost more* on account of local conditions, a combined system will be adopted; wherever it costs *less,* one ought to be happy to be able to effect the underground removal of all liquid household wastes, even under limited financial conditions.

September, 1882.

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.*

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

(Continued from page 485.)

Similar scales, but much more elaborate, furnish the dimensions for the valves and other details in the construction of steam-heating apparatus. The leading example already given will suffice however as an illustration of the method.

It might seem that too much prominence has here been given to minor details, in dwelling at such length upon the screw-threads and the exact proportions of tubes and fittings; but it can be unhesitatingly asserted that facility of construction, economy of material, and careful elaboration of detail, have been largely concerned in the establishment in America of an industry almost unknown in Great Britian, and of which the history has hitherto remained almost wholly unrecorded. Indeed the only book in the English language on heating by steam, until the publication in America of an elementary work a few months ago, was that of Robertson Buchanan, 1811-1814. Beyond the catalogues and circulars of manufacturers and dealers, little or no practical information has appeared in print; while a whole class of skilled workman, and nearly forty years of experience, have developed the practicability of the system, and extensive usage has accustomed the entire American community to its attendant discomforts and annoyances.

Boilers.—Most frequently, and in particular for large apparatus, the steam for warming in America is supplied by one or more horizontal tubular or Seguin† boilers, set in brickwork. For a small extent of warming apparatus the vertical tubular boiler with internal firebox is possibly the one most usual. For medium, and large apparatus the original Seguin boiler is adopted, which consists of a horizontal cylindrical shell, containing tubes in the lower half, with a steam dome on the top; the tubes are arranged in vertical, and horizontal rows, not alternating or zigzag; and the best practice is to place a manhole in the front end over the firedoor, and beneath the tubes. The boiler is fired underneath, and the products of combustion return through the tubes from the back to the front, and then pass back again over the top to the boiler, which is covered in with brickwork; the temperature of this top flue rarely exceeds 400° Fahrenheit. The fuel used is anthracite coal, yielding 8 to 12 per cent. of ash; and when well supplied with air it evaporates from 8½ to 9 lbs. of water per lb. of coal. The boiler fittings, gauges, valves, pipes, etc., are such as are usual for boilers in England; only, as they are rarely made by engine-builders, but by the "steam-fitting" maker, it can be claimed for them that they are generally more sightly, as well as better and less expensive, than in England. Dampers and damper-regulators are in general use, the latter being constructed with elastic diaphragms arranged to be loaded for any desired temperature, and often with some automatic arrangement for changing the load to meet changes of temperature outside or inside the building warmed. Where the whole of the circulation through the warming apparatus is entirely closed from communication with the atmosphere, the boiler pressure is allowed to fall below atmospheric pressure, to be as low as 140° temperature of the steam.

One other boiler at least has successfully stood the severe test of competion with the Seguin boiler, namely that known as the Babcock and Willcox water tube circulating boiler,‡ having a horizontal steam-drum or separator overhead. This boiler was tried by Mr. Nason in nearly its present form, but with smaller tubes, the joints of which failed as made by him.

Either of these boilers is practically safe from disastrous explosion. Out of the many thousand of Seguin boilers which have now been in use from one year to forty years, only two or three well-authenticated instances have occurred of violent explosion, and none so far as the author is aware, have involved loss of life. Of all the stationary boilers that are employed in the United States for any purpose whatsoever, perhaps one-half are of the Seguin type. The deterioration of all heating-apparatus boilers is more serious from rusting in summer when idle than from wear in use. In fair service the duration of the shell of the horizontal tubular boiler is from thirty to forty years, at least where water is employed that does not produce scale or deposit. The wrought-iron flue tubes cannot be considered to last more than seven or eight years, even with water of good quality.

The most serious defect in the Seguin boiler is the liability of the bottom plate, just over the fire-bridge, "to come down" or bulge outwards, or to become blistered, when strong firing is carried to the extent of 10 lbs. of coal or upwards per square foot of grate per hour. This accident is more likely to happen when the tubes are arranged zigzag in alternate rows, or are placed close together, the circulation of the water between them being impeded in either case; and the provision of a large water space in the bottom of the boiler, such as results from the practice already mentioned of placing a manhole in the front end beneath the tubes, tends to obviate the risk. Recently a hollow framing or slab, made of boiler-plate, filled with water and connected with the boiler by circulating pipes, has been substituted for the front plate of the furnace containing the fire-door, and thus forms a permanent wall, serving also as a saddle to support the front end of the boiler. The details of brickwork setting, flues, and chimney, present no unusual features as carried out in America.

There are of course innumerable varieties of boilers and settings. The possible contortions of boiler-plates, tubes and castings are far from being exhausted; and the economy claimed for each fresh device is generally in proportion to its complication. Just now there is a crop of devices in America for the more complete combustion of gases, after the plans generally of the late Mr. Charles Wye Williams, Assoc. Inst. C. E.; some of these, and others for burning such fuel as saw-dust, coal-dust, spent tan, etc., are as successful as they were thirty years ago.

For the fire-grates also of the boilers there is a revival of sundry shaking appliances; but for the American anthracite these schemes will speedily die out, since it resents the least disturbance after having once been ignited, and admits only the gentlest turning at the bottom for allowing the ash to run out like sand from an hour-glass. An improved grate however, made with wrought-iron fire-bars of square or triangular section, with their ends resting in bearings so that each bar separately can be rotated, seems really to have won favor for heavy firing, and must be mentioned with approval.

For the smaller sizes of warming apparatus there are several devices of magazines for holding a store of fuel, from which a continuous supply to the firegrate is dragged down or allowed to run down upon the grate. Some of these magazines hold 4 to 8 tons of coal, which will last from one month to three months. It may be mentioned that American anthracite coal, having the strength of most English building stone, is got from the seam in massive blocks; these on reaching the pit bank are broken up into lumps, which for domestic use are screened to various sizes, ranging from as small as peas to as large as eggs, while the "furnace coal" for manufacturing purposes is sorted in still larger sizes.

TO BE CONTINUED.

* A paper read before the Institution of Civil Engineers, November 28, 1882.

† Introduced in France about 1826 to 1830 by M. Seguin, engineer of the St. Etienne and Lyons Railway; and in America about 1844 by Mr. Nason.

‡ Minutes of proceedings Inst. C. E., vol. lxi., p. 379

Will "Young Reader," who writes to us about fitting up boilers and tanks, please send us his name and address? This is the necessary condition of obtaining an answer.

A bill is under consideration in the Connecticut Legislature, appointing Professor William Brewer, of the Sheffield Scientific School, Commissioner to report on the pollution of streams.

The *Builder* mentions a case of lead poisoning in which the party brought suit against the corporation supplying the water. The water was brought through a lead service-pipe, which, it appears, was the property of the plaintiff, and put in at his expense. The court decided that as the water was wholesome as supplied by the corporation, and that as the consumer had a choice of material for service-pipe, the corporation was not liable for injuries sustained.

Correspondence.

THE SEWERAGE OF BINGHAMTON.

A REPLY TO MR. HERING.

NEWPORT, R. I., *April* 28, 1883.

To the Citizens Committee, Binghamton, N. Y.

Gentlemen:—With no desire to enter into a controversy with Mr. Rudolph Hering, I shall make a very brief reply to his strictures on my former communication.

Mr. Hering is annoyed by my statement that his project is "very crude, imperfect and unsatisfactory," and he retaliates by suggesting neglect of duty in my own study of the case, and crudity in my work. Mr. Hering has read my criticism with too sensitive an eye; my remark applied entirely to the *system* he had adopted, not at all to the *project* that he based upon it. I never supposed that he was not thorough and conscientious in the performance of his task. With his assumption that I slighted my work, I, of course, do not agree, nor do I consider the charge worth refuting; my methods are tolerably well known, and my results are generally respectable. In a spirit of less annoyance Mr. Hering would probably not have questioned them as he has.

Concerning the differences between us Mr. Hering brings to his support eminent and well known authorities. The engineers to whom he refers would not pretend, as he evidently does, that the systems according to which they have been working are not susceptible of improvement. As a matter of fact, the best of them, including Mr. Rawlinson and Mr. Lindley, have voluntarily expressed to me their most cordial appreciation of my improvements.

It will suffice to say here, that I still consider the system recommended by Mr. Hering "very crude, imperfect and unsatisfactory,"—in fact, in view of what we now know, little better than a makeshift. I reassert in the most emphatic manner all of the statements of my former communication to you. If you need further argument in the matter, I am confident that I can convince you that I am generally right and that he is wrong—*in system.*

Mr. Hering, in questioning my right to a patent, as he seems to do, evinces a less favorable opinion of my common sense than I supposed he entertained. I have long been familiar with all the facts that he cites concerning previous work. My solicitors were made familiar with the same and the examiner at the patent office made a searching investigation as to the state of the art at the time of my application. It was found, on all hands, that the *combinations* that I patented were entirely novel.

The engineer who constructed the sewerage of Pullman paid me the very sincere compliment of imitation. His work was practically a repetition of that at Memphis, and was fully covered by my application, already on file in Washington.

Mr. Hering's quotations from THE SANITARY ENGINEER, so far as they apply in principle, seem to have an equal bearing on the patented "system" for house drainage with the aid of wrought iron soil pipes, with which he has hazarded a professional alliance.

GEO. E. WARING, Jr.

HEATING PRIVATE RESIDENCES.

NEW YORK, *April* 10, 1883.

To the Editor of THE SANITARY ENGINEER:

A correspondent in Ohio writes me as follows: "I intend building a residence this spring, and would like some advice about the best and most healthful means of *warming* it. What would you advise? Have you had any experience with steam or hot water?"

Can you, through your good paper, give some information on this subject?

Thanking you in advance, I beg to remain,

Truly yours, EDWARD WINSLOW.

[As a general rule we dislike queries to answer on which it is necessary to write a small treatise. In this case, however, we take up the subject of the best and most healthful methods of warming houses in the State of Ohio with much pleasure. The great majority of houses in that fertile and favored region are best warmed by stoves, for the reason that the people living in said houses cannot afford to purchase indirect radiation apparatus or to provide the fuel for it if the apparatus were given to them.

We infer that the Ohio correspondent is able to provide either steam or hot water apparatus, and that, therefore, his house will be a large and somewhat costly one.

(In parenthesis we may remark that the amount of recreation and direct happiness obtainable from studying a question given in terms as above, considering all the possibilities of the case and guessing at what is wanted, can only be understood by actual experience.)

We have used both steam and hot water, and of the two, for a private residence in Ohio, we think it most probable that we would prefer the hot water. With either of them there can be arranged a thoroughly good and healthful system of heating, but this best arrangement is somewhat expensive; and moreover, to secure the best results, it requires that the gentleman who is going to build the house shall place the sketch plans of his architect, before the working drawings are commenced, in the hands of an expert to advise as to the heating and ventilation.

If this expert is not connected with any furnace, steam or hot water heating establishment, he will probably charge from $50 to $150 for going over the plans—calculating what is needed and furnishing the requisite data to the architect.

But there are difficulties in finding the expert, and in insuring, that his advice is carried out. This plan requires not only good judgment, but a very firm determination, to make it a success.

Now, while in this country almost every one who can do pipe fitting is ready to undertake a steam heating job, the case is different as regards hot water, and the probabilities are that the few who will bid on a hot water job will understand their business much better than those who will furnish the lowest bids for a steam heating plant.

The principal objection to a low pressure hot water apparatus for a private house is the amount of space required in the basement or cellar for the coils with their containing piers. The essential feature of this form of apparatus is that it gives a large heating surface at a comparatively low temperature (below 200° F.), and to give this surface requires room.

Nevertheless, it is possible, by the use of mixing chambers, to obtain the same results with steam or with furnaces as with hot water, but more care and attention will be necessary to secure constantly satisfactory results.

If cost is a consideration, we would use a hot air furnace and have open fireplaces besides. If willing to incur a greater expense than the above would involve, we would use steam heat and the fire-places, and if room and expense were no consideration, we would use a hot water apparatus and the fire-places.

On page 331, issue of August 1, 1880, will be found an instructive chapter on this subject.]

A SUGGESTION FOR NEW YORKERS.

NEW YORK, *April* 25, 1883.

To the Editor of THE SANITARY ENGINEER:

While on the subject of an increased supply of pure water for this city, would it not be well to try and keep what little we have as free from contamination as possible, instead of, as is now the case, bringing it directly in contact with the foulest air to be found in our houses before using it in our kitchen or upon our tables? Permit us to explain what we mean. It is usual to place an open tank or reservoir for water in each water-closet, which tank is supplied directly from the Croton pipes, through a faucet, which is controlled by a float or metallic ball connected to the faucet by a lever. As the water in the tank lowers, this ball falls with it, and thereby opens the faucet and admits a fresh supply if there be any there to run; but if, as is now the case in most parts of the city, the water does not rise to the tank except during the night, the ball continues to fall as the water is drawn out of the tank, and for the greater part of the day the faucet is wide open, and whenever water is drawn in the kitchen or lower parts of the house the water-pipe is filled with air from the water-closet. We know of several that are in this condition, and they may be heard at any time almost during the day, as the air is drawn into the pipe with a whistling sound when water is being drawn down stairs, or when again it is shut off, and the water suddenly rises in the pipe and expels the air.

Why are not these tanks made air-tight, and supplied with fresh air from above the roof? Would not the following plan be practicable and remedy the evil?

For the ordinary tank now in use, make a cover, and line the under side of it with sheet lead or other metal and let this metal lining turn down so that the lower edge of it will drop into a groove, which extends all around the sides of the tank, and just below the line of over-flow, so that this groove will be filled at least once a day; now, when the water is out of the tank this groove contains water enough to make a seal and keep all air from the closet; now run a pipe from the tank to the roof, and supply the tank through this pipe with pure air, as shown in diagram.

To leave the cover free to be lifted off we would run the pipe, as shown through the side of box, and turn the inside end up above the water line.

Yours very truly, etc.,

EDWIN A. JACKSON & BRO.

[We presume when our correspondents refer to a water-closet cistern they mean the cistern sometimes placed over it, from which the flushing water is drawn. They are mistaken in supposing that most water-closets in this city are so flushed; by far the greater part are flushed through a valve or ball-cock attached to and being part of the closet itself, and the risk he alludes to in the case of the cistern, while to some extent it exists, yet is by no means as great as with the direct supply, and such as it is depends on the character of the air in the room in which the cistern is placed, and the condition of the cistern as to cleanliness. The absence of an adequate water supply in this city undoubtedly entails many risks, and that pointed out is one of them; but the remedy proposed by our correspondent in this particular emergency does not strike us as practicable. The only safe and proper plan is to insure that at all times there is a supply of water for these cisterns, so that the ball-cocks cannot remain open, and not to rely on water-closet cisterns as storage tanks to be filled through a ball-cock at night. For the next six

years at least no cistern or water-closet in most houses in this city above the first floor can rely on having a constant supply of water, unless a tank is placed at the top of the house, which tank must be kept full by pumping; and water from this tank must be conveyed to the fixtures below it. Unless something is done to stop the waste, we expect that even the first floors of many of our houses will be deprived of water from street pressure before a new supply reaches the city. We advise householders, therefore, to place tanks above where they want to draw the water, have these tanks kept full by pumping, and take a supply from that to the various fixtures that they wish to retain in use; others should be removed. Drinking water should be drawn from a trap down stairs, and not from this tank.]

To the Editor of THE SANITARY ENGINEER:

Can you inform me in what way I can procure Douglas Galton's device for heating an ascending current of air in an open fire-place, mentioned in Dr. Coan's "Ounces of Prevention," in *Harper's Weekly* of March 24? I have a couple of fire-places that I would like to use if I can prevent too great an outlay for fuel. F. F. C.

[The Galton fire-places are referred to in a paper on Small-pox Hospitals, by D. R. J. Farquharson, Secretary of the State Board of Health, Des Moines, Iowa, full extracts of which were given in THE SANITARY ENGINEER of May 11, 1882. Dr. Farquharson there said: "Finding (in 1876) no Galton fire-places were to be had in this country, I procured two made in Cincinnati, which answered the purpose very well." You can probably obtain from him the address of the Cincinnati makers.]

JOURNEYMEN PLUMBERS' PICNIC.

The Benevolent and Protective, and the Brotherhood and Journeymen Plumbers will unite in holding a picnic, with athletic games, at Sulzer's Harlem River Park 126th street and 2nd avenue, June 5. Three series of events are provided, one open to members of the societies, one to the plumbing trade and plumbing material manufacturers, and one to all amateurs. These events include 100 yards dashes, quarter mile run, half mile run, one and two mile walks, tugs of war, throwing the hammer, running broad jump, and sack race. The combination of the societies in the one grand picnic ought to make this unusually successful. Persons who may wish to donate prizes should communicate with George W. Flood, 225 East 74th street.

PLUMBERS' PROFITS.

FREEPORT, *April* 21, 1883.

To the Editor of THE SANITARY ENGINEER:

Have been a subscriber for your valuable work only a few months, and in those few months have found how *bitter* "plumbers' profits" must be to those who call themselves "practical plumbers." And I must say with "Helper," of Chicago, *What* are they?

I am the only practical plumber here, but have a hardware firm with tinners to compete with, and such is the desire to have cheap work done, that a plumber can get no profit, not even the regular pay.

They buy their goods from the same firm that I do, and this firm sells to every plumber in Chicago. I will give the name of the firm if need be. I know this, for I belong in Chicago myself. Now I say, let the plumbers, all of them in the United States, form an association, and notify the dealers to protect us, or we will protect ourselves, and any dealer found selling goods outside the trade to quit trading with him.

I wish to make reply to Mr. Worthington of Philadelphia: "Can you be honest and furnish compression finished bibbs at 75 cents apiece, or ¾ strong lead at 12½ cents per foot?" That is the competition I have, and shows what hardware men can buy material for.

In reply to your editorial, in April 5th number, the leading Chicago firms sell at list price to builders; I can prove it. Then they say the plumbers don't protect themselves. It is false. If the plumbers take a job for less than cost, it is to beat some one whom they have sold goods to.

How can we compete against tinners any other way? Why do plumbers fail? Simply because every hardware firm in the United States is dealing in plumbing material, and buying cheaper than the plumbers themselves. Why, one of them offered me porcelain goods cheaper than any one can buy them in Chicago. That shows how Chicago gets left.

In reply to Mr. Moody, of Worcester, he should congratulate himself for not receiving some of this experience. Refer him to some of the prices in my letter, and see how much profit he would get.

I am glad the plumbers are to have a convention for this purpose. They can never make a living in the plumbing business, until they put a veto on the manufacturers. I think Mr. Bargamin, of Staunton, Virginia, gives a true statement, in this matter; also Mr. Young, of Chicago. These curbstone plumbers that Bargamin is troubled with ought to be run out of town.

Please agitate this question, Mr. Editor, and you will receive the many thanks of plumbers.

[We should be glad to see all good plumbing succeed in business, but that is hardly in accordance with the natural order of things. We must say, however, that we think Mr. Moody has a better appreciation of the problem, and the conditions necesary to its solution, than our Freeport correspondent.]

To the Editor of THE SANITARY ENGINEER:

Please let me know, through your valuable columns, where there is a hydraulic jack made in England, that a man can fill with two gallons of water every six weeks, and use it about fifty times with the same water, or if he will have to renew the water every time the jack is in use, and oblige, Yours respectfully, JOHN NORRIS.

[Hydraulic jacks, or lifts, which use the same liquid repeatedly, though not so large a quantity as two gallons, even in the larger size, are manufactured by R. Dudgeon, 24 Columbia street, New York, and 114 Fenchurch street, London, and, we presume, by numerous other English firms.]

NEW YORK, *April* 13, 1883.

To the Editor of THE SANITARY ENGINEER:

Do you know of a pipe made with a valve like a clack valve, to be used in drainage? I have a foundation made on a trench of broken stone and drained by a 4-inch pipe to a sewer. Had hoped to strike the sewer on *the top*, but could not. In most circumstances, indeed, all except extraordinary ones, this will work, but sometimes (it has happened once in six years), the water backed up in the sewer and went into the foundations and cellar of adjacent houses; so to prevent it I want a pipe with a valve opening but one way.

Please give me what information you can, and oblige, Yours respectfully, WM. H. WILEY.

[Several horizontal flap valves have been made to place in a line of pipe. With these, however, there is a possibility of stoppages. An ordinary brass sewer valve on the end of your drain pipe, which hangs open, except when back flow of water closes it, is used for such purposes. Either of these appliances your plumber will know where to get, as dealers in plumbers' materials sell them.]

LAYING DRAINS.

WILMINGTON, DEL., *April* 20, 1883.

To the Editor of THE SANITARY ENGINEER:

As a compromise between your suggestion of a walled and covered trench (page 459 S.E.), and that of Col. Waring's, of filling the pipe-trench with grout, I would suggest, in order to avoid a possible harbor for rats, etc., to fill the walled and covered trench with clean sand or gravel around the pipe, which could easily be removed when repairs were necessary. C. E. F.

[The suggestion of C. E. F. is open to this objection, viz: That when pipes are buried in sand they are not readily made *visible*, and if a leak occurred it would continue indefinitely, till the bed of sand and all its surroundings became foul. If under or inside of a house, such a state of things would be likely to be dangerous to the health of the inmates long before it might attract attention.]

SEWAGE DISPOSAL.

The Local Board of Hendon, England, are exercised about purification of the sewage from that town. At a recent meeting, Mr. Melliss, the well-known engineer, appeared by request before them, and gave informally, in reply to questions, some interesting information. A full report is given in the *Hendon and Finchley Times*, from which we condense the following synopsis of his remarks.

Mr. Melliss said, in substance:

"I have had a great deal of experience in connection with this matter of sewage treatment. In fact, for 25 years I have studied the matter, and for the last ten years I have been almost exclusively connected with the matter. I know all the systems in vogue, and I have carried out a great many experiments myself with a view to arriving at the truth.

"I recommend the system used by the Rivers Purification Company because I consider it to be the best; not on the evidence of my own experience, but founded on the published evidence of independent men. The Local Government Board some time ago appointed an inspector, Dr. R. Smith, to look into precepitation processes with a view to such a process being allowed to be adopted by local authorities. Mr. Smith made a very careful and scientific investigation of the processes, and his report was published in the form of a blue book. That is the only official document bearing upon precipitation processes, unless we take one which was published by the town council of Glasgow some time ago. Dr. Wallis analyzed the effluent water and made a very valuable report for the use of the town council. These are the only two documents I have seen which are really outside the pale of interested companies or parties. As these state that the Rivers Purification Company turn out the best effluent water, I recommend that system.

"They are not bound to any particular process, but the precipitate they use is an alumina process. I draw a distinction between the processes in use which have lime for their base and others which have alumina for their base. In an alumina processs, salts of iron and a very small quantity of lime is used. They filter the effluent through land, or, as at Hertford, where it is filtered through artificial filters.

"If the operation of treating sewage by precipitation is properly done, there is not the slightest cause for complaint; but if the work is improperly done, there will be an intolerable nuisance.

"Properly designed precipitation works can be executed so as to be suitable for any process without subsequent alteration.

"Assuming there is no pumping, and if the sewage could be gravitated to the outfall, I should think works could be created to deal with 10,000 persons for between £3,000 and £4,000. I am, however, speaking quite off-hand. That would include three or four tanks.

"How much land would be required for that sewage to run over would depend much upon the quality of the land. It also depends upon the depth to which it can be underdrained. I should not hesitate, if the land is at all reasonable, to put the sewage of 2,000 persons on each acre. If the land is very good we might get more upon it.

"The cost at the outfall would materially depend on the amount of sewage which came down. In a town of 10,000 inhabitants, if only 2,000 were connected with the sewers, the cost of treatment would be less.

"If I understand rightly, nothing has yet been done at Hendon, so that it is quite clear the field before you is much better for that, but the time has come when the public look at the drainage of a district, and when they find a place which is not drained they will not live in it. Last week I was called to a house in the Thames Valley. It was a very fine mansion, but it had no drainage at all, and I was asked by the occupier if he should leave the house. Coming to the question as to how you should act, I should say get out a scheme or system of drainage. Carry out the main principle—lay down your sewers and provide outfall works. After that is done, then I should advise you to make a bargain with some one to provide for the sewage at the outfall; but you must take care how the bargain is made. I always advise sanitary authorities to do this.

"I certainly advise you to separate the sewage as much as you possibly can. In some places which I have examined and reported upon, it was almost certain that a portion of the rainfall ought to go into the sewers for flushing and cleansing purposes. In a new scheme the rainfall is excluded.

"As regards the value of the sludge or manure produced by precipitation, unfortified by any addition thereto, to enhance its commercial value; Dr. A. Smith's report, and also that by Dr. Wallis, the chemist to the Town Council of Glasgow, state that sludge treated with lime was worth about 10*s*. a ton, and sludge treated with alumina worth about 20*s*. per ton. I doubt very much whether any sludge made into cake is worth £3 10*s*. a ton. During the past 25 years the manufacture of manure from water-carried sewage has ruined several big companies, and money to the extent of £100,000 has been spent. If the Board can get a company to give a substantial guarantee to treat the sewage in that way and sell the manure at £3 10*s*. per ton I should say, by all means take it, but have the guarantee very well drawn out."

E. G. LOVE, Ph.D., *Gas Examiner.*

STEPS TOWARD PUTTING ELECTRIC WIRES UNDERGROUND.

As briefly noted in our issue of last week, a conference of representatives of nearly all the electrical companies of this city—telegraph, telephone, electric light and fire and burglar alarm—was held at the office of the Gramme Electrical Company, in the Boreel Building, 115 Broadway, on the 20th ult., to consider the expediency of united action on the question of underground wires. The meeting had been called by Col. R. R. Hazard, President of the Gramme Co., who, in his opening remarks, said:

"We have all seen the ignorant, ill-considered and ill-digested legislation in relation to this subject, arising undoubtedly from the absolute lack of knowledge of legislators as to the real nature of the questions involved. And it has occurred to me, that by bringing together gentlemen representing the different corporations most interested, we might be able to understand the subject ourselves thoroughly, and show to the legislators and the public that our interests and their interests are substantially identical, and that we are on the road to giving them all they want. That is the object of the meeting, and to that end the twenty-one electrical corporations doing business in the city of New York were invited, together with the scientific men and the professors of the various universities, the Governor of the State and the Mayor of the city, so that everybody might be here if they saw fit, and represent the views of their constituents."

After the election of Mr. J. P. Davis, Vice-President of the Metropolitan Telegraph and Telephone Co., as chairman, Col. Hazard offered a series of resolutions, with a view of bringing up a discussion. "The purpose and extent of the resolutions," said Col. Hazard, "is to leave the whole matter to a select and authoritative committee representing all the different interests." Each company was to have one representative. Mr. Pope, of the Manhattan District Telegraph Co., said he thought it hardly necessary to appoint one for every company. He thought so large a number would not work together to advantage, and that five or six, say one for each class, would be better. Col. Hazard, in reply, said that this had been considered, and it was thought that if all were not represented there would be a certain amount of jealousy and mistrust. It was, moreover, proposed to sub-divide the committee when appointed, having one committee on electrical and scientific questions, one on mechanical problems, another on legal points, and another on the business and commercial side—care being taken to select the highest talent in each department.

Mr. Chandler, of the Fuller Electrical Co., agreed with Mr. Pope that the number of the proposed committee was

Digitized by Google

too large, but the prevailing sentiment of the meeting was in favor of the original number proposed, and in favor of the resolutions in general. Prof. Morton said they seemed to meet the case. "It is taking hold of the thing in a rational way, and something or other is likely to come out of such a handling of it."

After some further discussion, resulting in a few slight amendments to the resolutions, they were unanimously adopted in the following form:

"*Resolved*, That in the opinion of this meeting the time has arrived when it is expedient to make exhaustive examination of all devices and inventions pertaining to the subject of underground electrical communication, with a view to determine whether any inclusive system can be found which will enable the electrical corporations to establish such communications.

"*Resolved*, That it is the sense of this meeting that the public desire to relieve the thoroughfares from poles and wires is quite in accord with the wishes of the corporations, and that the true interest of the shareholder is to be found in a permanent, inclusive and protected system.

"*Resolved*, That the problem presented to the corporation and the electrical engineers is complex and difficult, and in the opinion of this meeting has not yet been fully solved; that any system to be adopted must combine the highest efficiency, reasonable economy, and serve inclusive interests; that while it is perhaps possible for trunk line telegraphs to avail themselves of existing desires, it is not possible in the present state of the act for services connecting every house in the city so to do, without an expenditure so vast as to be prohibitory in most instances, and that, therefore, hasty, compulsory legislation is to be deprecated as destructive to useful and indispensable public convenience.

"*Resolved*, That a committee be appointed by the chairman of this meeting, either now or hereafter, at his option, consisting of one delegate from each electrical corporation invited to be present at this meeting, the Governor of the State and Mayor of the city, with power to add to its numbers, which committee shall be authorized to examine the subject in respect to its scientific, mechanical, legal and financial considerations, with power to adopt such course of procedure as may appear advisable to it after such examination, and with the approval of the respective corporations, form a company in the collective interest, and consider such inventions and devices in that behalf as may prove to be indispensable to a successful installation."

The following are the members of the committee appointed:

Governor Cleveland, Mayor Edson and the following representatives of the various electrical companies: H. L. Bailey, Time Telegraph Company; D. H. Bates, Western Union Telegraph Company; A. B. Chandler, Fuller Electrical Company; W. A. Childs, Law Telegraph Company; H. Cummins, Postal Telegraph Company; L. E. Curtis, United States Electric Light Company; J. P. Davis, Metropolitan Telephone and Telegraph Company; S. B. Eaton, Edison Electric Light Company; C. R. Flint, Western Electric Light Company; R.R. Hazard, Gramme Electrical Company; E. Holmes, Holmes' Burglar Alarm Telegraph Company; C. D. Hotchkiss, Mutual District Messenger Company; W. M. Ivins, Jablochkoff Electric Lighting Company; F. R. May, American Rapid Telegraph Company; T. J. Montgomery, Brush Electric Company; G. S. Mott, Bankers' and Merchants' Telegraph Company; H. W. Pope, Manhattan District Telegraph Company; C. W. Price, Baltimore and Ohio Telegraph Company; A. C. Richards, Automatic Signal Telegraph Company; J. Eliot Smith, Fire Department Telegraph; Elihu Thomson, American Electric Company. Representatives of the Gold and Stock Telegraph Company, the Mutual Union Telegraph Company, and the American District Telegraph have yet to be appointed.

Mr. J. P. Davis was elected chairman, R. W. Blackwell, treasurer, and W. C. Behrens, secretary. Messrs. J. P. Davis, R. R. Hazard and Frederick H. May were appointed to present nominations at the next meeting for the permanent sub-committees.

The Mayor of Hartford, Conn., states the lighting of the streets of that city, involving an expenditure of $46,647.51, has not in many respects been satisfactory to the public. While it is claimed that the gas in use is of excellent quality, the results do not seem to sustain this claim.

Application has been made by the Portable Electric Light Company of Boston to the Post-Office Department at Washington, for a rescinding of the order of April 12, by which it is proposed to exclude the company from the mails.

ON WATER ANALYSIS.

One of the most interesting of the documents contained in the appendix to the Report of the Medical Officer of the Local Government Board for 1881, is a report by Dr. Cory on the results of examination of certain samples of water purposely polluted with excrements from enteric fever patients, and with other matters. The object of the inquiry was to ascertain how far some of the processes in common use among chemists for water analysis could be relied upon to detect dangerous pollutions, and the results are stated as follows:

"Firstly, with regard to the permanganate process. This method as usually conducted and known as the Forchammer process is not satisfactory. Applied to the examination of waters polluted with differing amounts of the same organic material, it does indeed tell the direction of the differences and even give some indications of the relative amounts. But for the process to show as much as this, it is important that the circumstances of the several samples shall have been identical. * * * The test affords no indication of the total amount of oxidizable material contained in the water, and cannot therefore be employed in comparing water from different sources. * * Secondly, with regard to the albuminoid ammonia process of Messrs. Wanklyn and Chapman. This again may be trusted to show which of two samples of water is the more polluted, when the polluting material contained in each is of the same kind; also in that case, and when the absolute amount of polluting material is not great, it is capable of determining the relative degree of pollution in a number of samples.

"But when the polluting material is in large absolute quantities, a given difference in the extent of pollution is not indicated by corresponding difference in the yield of albuminoid ammonia (see table).

"Equal amounts of albuminoid ammonia may be furnished by extremely different quantities of nitrogenous polluting material, and conversely extremely different quantities of albuminoid ammonia may be furnished by one and the same quantity of nitrogenous polluting material, and this is the case even though the polluting substances differ no more *inter se* than one typhoid stool differs from another stool. When a typhoid stool is compared with a healthy stool obtained under somewhat similar conditions of diet, water polluted with the healthy stool yields to this process a larger amount of albuminoid ammonia than water polluted by the same quantity of typhoid stool."

A preference is expressed for the combustion processes, with the object of determining the amounts of carbon and nitrogen present. These processes were found to indicate with a considerable degree of accuracy the amounts of albumen or urea added to samples of water.

As regards the distinguishing by chemical tests waters polluted by typhoid excreta—the conclusion is the same as that reached by the commission employed by our own National Board of Health to investigate the same subject, viz.: that there is no means at present at our command for distinguishing such dangerous forms of excremental pollution.

Dr. Buchanan sums up the result of the inquiry as follows:

"The lesson is taught afresh and significantly by Dr. Cory's report, that while we must ever be on the watch for the indications that chemistry affords of contaminating matters gaining access to our waters, we must (at any rate until other methods of recognition are discovered), go beyond the laboratory for evidence of any drinking water being free from dangerous organic pollution. Unless the chemist is well acquainted with the origin and liabilities of the water he is examining, he is not justified in speaking of a water as "safe" or "wholesome," if it contains any trace whatever of organic matter; hardly, indeed, even if it contains absolutely none of such matter appreciable by his very delicate methods. The chemist can, in brief, tell us of impurity and hazard, but not of purity and safety. For information about these we must go, with the aid of what the chemist has been able to teach us, in search of the conditions surrounding water sources and effecting water services.

ON THE ACTION OF CERTAIN VEGETABLE ACIDS ON LEAD AND TIN.

The March number of the *American Chemical Journal* contains a paper under the above title, by Francis P. Hall, which is of practical interest and importance in a sanitary point of view. The author remarks that the enormous and continually increasing use of canned goods brings up the question of the possible injurious effect of the material of the can on its contents, and of the effect of various vegetable acids on the material of the cans or the exposed solder. His first experiments were upon the action of vegetable acids on alloys of lead and tin, and from these it appears that alloying with tin increases the corrosion of the lead, or that the alloy is more acted on than either of the metals. In the absence of air, as in sealed cans, acids had very little effect on the alloys. But when weak acids were placed in the ordinary cans, and the latter were left open, the tinning was rapidly dissolved. The conclusion from this is that when a can is opened it should be emptied at once, and not be set aside half full.

The next investigation was into the quality of the tin plate of which cans are made. Mr. Hall concludes that tin-ware and fruit cans are made of "bright plate," coated with pure tin, and not, as has been alleged, from "terne plate," which is used for roofing purposes.

He says: "I procured some specimens of plate through the kindness of one of the largest importing houses in the city. These I tested by several methods. With the bright plate, taking small pieces, I could find no lead at all, and only after taking half a square foot did I find a trace. This was no more than would be found in most English bar-tin. I now tested a number of cans from various sources, as well as the worst looking tin-ware from the so-called 5-cent stores, but not once did I find enough lead to show an intentional adulteration. Neither have I found any well-instituted attack on the character of the tin-plate in this country. A good deal has been said, and many suspicions thrown out, but the only statements of analysis that I have seen are in a Board of Health report of a Western State. The author found lead so invariably in all tin articles that came into his hands that one cannot help suspecting that the methods of analysis were unreliable. He even observes that he found a considerable quantity of lead in what was sold for pure tin—a thing quite possible, it is true, but not likely to happen with dealers to whom a chemist would naturally go for pure supplies.

Even if the tin of the can is pure, there remains the solder, which always contains a large quantity of lead, and is used very freely. There remains, also, the fact that the vegetable acids act considerably upon tin itself. There are many published statements as to the presence of tin in canned goods, and the careful inspection of the inside of a can which has contained an acid fruit shows quite clearly, in many cases, that corrosion has taken place. Moreover, although my experiments tend to show that the amount dissolved when the air is excluded is much less than when open, still it is an appreciable quantity; and if, as seems to be the case, the amount increases with the time, that dissolved from an old can must be considerable.

The terne plate, which is that most often used for roofing, cannot be considered quite harmless in cases where the water from the roof is used for household purposes. But as the tin roof, as well as the whole house, is generally covered with a paint containing far more lead than the terne plate itself, it would be absurd to complain while we use white lead to such an extent as at present.

Although constantly on the watch for tin-ware made of terne plate, I have been able to find none. I am informed,

Digitized by Google

on good authority, however, that it is sometimes used for that purpose, but conclude that such use must be rare in this section of the country.

ON COMMERCIAL TIN FOIL.

Tin foil is so much used now-a-days on chocolate, compressed yeast, cheese, and the like, that I thought the analysis of a few samples might not be amiss. Here at the outset we have a good proof of adulteration, from the fact that the price of most foil is but little more than half the price of pure bar tin.

I collected a number of samples from different importers and manufacturers. They varied greatly in thickness, coloring and design, but I had reason to suppose that many were the same in composition. I took what I thought was a fair sample of them, as regarded composition, and analyzed them.

The results of the analyses will be found in Table V. I give in the table the size of the piece of foil taken for analysis, its weight, and the weight of the lead and tin found in it, as well as the percentage of composition. Only the first three foils were sold for pure tin. Some were sold as "composition foils," but generally, unless special inquiry was made, nothing was said of their composition.

TABLE V.

No.	Amount taken.		Amount found in grains.		Percentage.	
	Size in sq. in.	Weight in grains.	Tin.	Lead.	Tin.	Lead.
1	6	0.2285	0.2275	.....	99.53	.....
2	6	0.4260	0.4227	.....	99.23	.....
3	6	0.5950	0.5929	.....	99.65	.....
4	6	0.5150	0.1162	0.3945	22.56	76.60
5	6	0.9080	0.0902	0.8752	9.94	89.95
6	6	0.7140	0.1642	0.5464	23.00	76.41
7	6	2.0785	0.0839	1.9860	3.86	95.75
8	6	1.8580	0.1172	1.7360	6.31	93.43
9	6	0.3030	0.1125	0.1819	37.44	60.03
10	2.25	0.4720	0.1078	0.3678	22.84	77.94
11	3	0.8005	0.2004	0.5969	25.03	74.55
12	6	1.4940	.....	1.2240	.....	81.92

In order to see if I had a fair sample of the foils in general use, and to see which of them were most used on articles of food, I took several foils that had been in actual use and analyzed them. The results appear in Table VI. It will be seen that each corresponds very nearly to some one in Table V. Nos. 21, 23 and 28 were on chocolate; Nos. 22 and 27 on different kinds of compressed yeast; Nos. 25 and 26 on "Neuchâtel" cheese; No. 24 on the outside of a box of troches; No. 23 was on a small cake of chocolate bought at a street stand, while No. 28 was an embossed foil, and on a very fashionable cake of chocolate; No. 25 was very brittle, and showed signs of being acted upon. The cheese was quite acid to litmus.

TABLE VI.

No.	Amount taken.		Amonnt found in grains.		Percentage.

Reviews of Books.

A MANUAL OF CHEMICAL ANALYSIS AS APPLIED TO THE EXAMINATION OF MEDICINAL CHEMICALS. Third revised edition. By Frederick Hoffman, A.M., Ph. D., and Frederick B. Power, Ph. D.

Dr. Hoffman's "Examination of Medicinal Chemicals" has been, in past years, especially valuable to those students and practical pharmacists whose lack of preliminary chemical training rendered impracticable the use of the more abstract treatises on analysis. The careful explanation of general and special processes, together with a considerable number of well-chosen illustrations, served to make easy to the beginner many otherwise difficult manipulations.

The third edition, just issued, maintains the same general character, appearance and objects which distinguished the former editions.

The first part is devoted to operations and re-agents, and includes a scheme for inorganic qualitative analysis, simple and very excellent description of volumetric analysis, and a short chapter on the separation and identification of the common poisonous alkaloids.

The second part treats of the individual chemicals and the proper tests for identity and purity. Many illustrations used in the first part are several times repeated in the second. Owing to the greater stringency and minuteness of the tests in the new pharmacopœias of the United States and of Germany, there is less remaining to be explained than formerly, and it is noticeable that the authors have often followed very closely the wording of the U. S. Pharmacopœia. Instance the descriptions of piperine and cinchonidine sulphate.

There is, however, considerable valuable information from outside sources, such as the results of recent investigations of assay schemes for opium and cinchona barks.

Following are tables of molecular weights, thermometric equivalents, weights and measures, and a good index nearly free from errors.

Taken as a whole, this is a book of very considerable value, first and chiefly to those who make occasional tests of commercial chemicals; and secondly, as a book of reference for busy analytical chemists.

The book contains about six hundred pages, and is well printed, bound and illustrated.

ELEVENTH ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD, 1881-82. SUPPLEMENT CONTAINING REPORT OF THE MEDICAL OFFICER for 1881. XXIV, 326 pp. 8vo.

This report by Dr. George Buchanan, with the appended documents, is of no less interest and value than its predecessors, and those who are familiar with the preceding volumes will understand that this means a great deal. Commencing with the subject of vaccination some interesting facts are given with regard to those who died of small-pox in London during the year 1881, especially with regard to children under 10 years of age, based on a special report made by Dr. H. Stevens.

The population uuder 10 years of age in London was 55,000 unvaccinated and 861,000 vaccinated, and the number of deaths from small-pox was 782 among those not vaccinated and 125 among those vaccinated. The mortality from small-pox among the unvaccinated was therefore about a hundred times greater than that among the vaccinated.

The 125 children under 10 who died of small-pox after an alleged vaccination have to be reduced to 117 by deduction of those who were discovered on inquiry to have been unsuccessfully vaccinated, and this number, 117, divides into 82 vaccinated by private practitioners and 35 by public vaccinators.

The number of London children under 10 who have been vaccinated is made up in about equal numbers of those vaccinated by private practitioners, and of those vaccinated at the public expense. The mortality is therefore much greater among those privately vaccinated and as these comprise the children of the upper classes, who run less risk of small-pox infection than the poor, it is evident that there must be some special cause for this.

Dr. Buchanan's explanation is that there is a form of private vaccination in London which offers itself in competition with public vaccination, and which parades its inefficiency as a reason for its acceptance.

Its professors say to young mothers "do you come to me and I won't hurt your baby; I'll make only one place on its arm, not four, as those public vaccinator, do." It seems to us that the best remedy for this sort of competition would be to make public the name of the vaccinator in every case of death by small-pox under the age of 10 where only a single insertion was made.

Dr. Ballard has commenced a systematic investigation into the nature and causes of summer diarrhœa, selecting for this purpose the town of Leicester which has for a long time been pre-eminent for its high death rate from this cause. Dr. Buchanan remarks that an immediate result from his labors is not to be expected but that the inquiry is well worthy of the time and pains that it is intended to bestow upon it.

It is in inquiries of this kind requiring much time and labor, and the comparison of data derived from different places, that a central health organization can alone do work of real value.

Dr. Ballard furnishes a report on an epidemic of scarlet fever in Halifax, from which it appears that while the disease spread by contagion in the ordinary way it was connected with a particular milk service from a place crowded with cases of the disease.

An important report is made by Dr. Cory on water analysis, a summary of which is given on another page of this journal.

Dr. E. Klein furnishes an important paper on the relation of pathogenic to septic bacteria, in which he in the main sustains Koch's criticisms upon Bushner and Pasteur, and gives many valuable details as to methods of experiment in this difficult subject.

Mr. Victor Horsley gives a report on septic bacteria and their physiological relations, which is a very complete summary of what is known on this subject, and is accompanied by a good bibliography. The last paper in the appendix is by Dr. Thudicum, being a continuation of his studies in the chemistry of the brain.

It is impossible in such a notice as this to do more than indicate the great value of this volume, and to say to every one interested in sanitary work that it is one which he must obtain and read carefully. We heartily congratulate Br. Buchanan on the evidence of scientific work in the right direction which it presents, and advise our own State Board of Health to take it as a pattern example.

The Perth Amboy Terra Cotta Company has issued a handsomely gotten up catalogue and price list of architectural terra cotta. There are 23 plates with upwards of 150 separate figures on heavy buff paper, accompanied by a separate indexed price list, which will be of service to architects, builders and house-owners.

BOOKS RECEIVED.

TRANSACTIONS OF THE STATE MEDICAL SOCIETY OF WISCONSIN, 1882.

ADULTERATION OF CEMENT.

The German Union of Cement Manufacturers has decided that, leaving apart the question whether certain mixtures are useful or otherwise, any mixture must be regarded as an adulteration, unless it be so declared and marked upon the sack or barrel. The only exception made was in favor of certain substances like plaster of Paris, the addition of not more than two per cent. of which improves the cement. The most usual form of adulteration consists in adding the powdered slag from blast furnaces, which gives the cement a fine greenish tint, the usual sign of high burning, and of great density, thus deceiving those who judge of a cement by its weight.—*Journal of the Society of Arts, Feb. 2.*

RICHMOND, VA.—Reports from Essex County state that small-pox is raging there and the people are almost panic stricken.

WOODBURY.—The small-pox excitement which was turning Woodbury topsy-turvy a few weeks ago, suddenly fell to zero. Dr. Dickens, of Readyville, an old physician of much small-pox experience, was sent for and soon declared the so-called cases to be nothing but measles.

An electric motor, invented by Mr. George Daft, has been experimented with for some months back on a line of track near Greenville, N. J. A company has been formed with $500,000 capital to apply the motor to street railways in Newark.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

STEAM TRAP.

We reproduce this week from "Engineering" a steam trap made and used in England, which presents some novel features.

The inlet to the trap, which is also of course the outlet of the pipe that is to be drained, is commanded by a small loose valve, alternately forced to its seat and released by

PLAN.

the rotation of a quick threaded screw spindle. The loose valve and spindle form a prominent feature of the invention. They are the only parts of the apparatus that are subject to friction, and as the two are independent the spindle can never be fixed by the temporary sticking of the valve. The spindle is controlled by a lever and a ball, all three being hollow, and together forming a channel for the water that enters through the valve to pass into the tank. The ball when empty is buoyant, but when filled with water it sinks, and it is the alternate filling and emptying of the ball that furnishes the motive power for opening and closing the valve. The action is as follows: Supposing the ball to be in the position shown in the figure, and to be filled with steam, a vacuum will be more or less quickly formed in it by condensation, the empty space being occupied by water that enters from the tank through a small hole not shown in the drawing. When nearly full the ball will sink into the position indicated in dotted

SECTION.

lines, and in so doing will rotate the screwed spindle and release the valve. The whole of the water accumulated in the steam pipe will then flow into the ball, and be driven, by the steam pressure behind it, up the dip pipe which forms the outlet of the ball, and escape through the tank. After all the water has been ejected the ball, being again full of steam and becoming buoyant, will rise and close the valve, which it will maintain shut until the steam is condensed, and the cycle of operations is again commenced. The frequency of the action of the trap is regulated by the size of the leak hole in the ball and the temperature of the water in the tank, and is independent of the pressure of the steam.

Messrs. Lancaster & Forge, of Pendleton, England, are the manufacturers.

Construction Notes.

CINCINNATI.—A bill transferring the control of the Cincinnati Water Works from the Board of Public Works to a board of five trustees has passed the Ohio Legislature. The trustees are authorized to enter into a contract with a private company for pumping the water into the reservoirs. These trustees are to be appointed by the Superior Court, and any contract made by them must be approved by the Commissioners of the Sinking Fund of the city.

BENNETTSVILLE, S. C.—The county commissioners of Marlboro County will receive proposals for building a court house until May 6; cost $20,000.

QUEBEC.—C. Baillairge, city engineer, will receive proposals for additional and improved water supply for the city, from Lorette, a distance of about nine miles, until May 15.

BRATTLEBORO, VT.—A water-supply is about to be introduced into Brattleboro, Vt. Mr. Geo. E. Crowell has brought water from several springs about a mile from the village into a reservoir, which when completed, will contain some 4,000,000 gallons.

MICHIGAN.—The Senate has passed a bill to authorize the formation of corporations in the upper peninsula, for the purpose of excavating, constructing, and maintaining water courses with water power appurtenant thereto, for furnishing, upon an agreed rental, water and water power, for mining, milling, manufacturing, domestic, municipal, and agricultural purposes.

LANSINGBURGH, N. Y.—A bill was passed April 24, in the Senate at Albany, for providing Lansingburgh with a supply of pure water and proper drainage.

NEWPORT, R. I.—The Beach Improvement Company has received a report from Mr. Frederick Law Olmstead, as to the best plan for improving a large tract of mud flats which is an obnoxious feature near the beach. He advises dredging out channels and piling the mud and sand removed in ridges between the channels and around the outside of the flats. The ridges to be planted and the outer bank to be made a drive and promenade. The estimated cost is about $150,000.

CINCINNATI.—The Board of Public Works has purchased the right of using the Bell waterphone forever at a cost of $15,000.

SEATTLE, W. T.—Work was begun April 9 on the new system of water works.

COLUMBIA, TENN.—The proposition of Travers Daniel to build a system of water works was voted on April 14, and adopted by a large majority.

WILLIMANTIC, CT.—The House resolution, providing for water supply of Willimantic, has also passed the State Senate.

QUINCY, MASS.—A bill has been reported from Senate Committee on Water Supply and Drainage to incorporate the Quincy Water Company with a capital not exceeding $250,000.

HAMILTON, OHIO—The trustees of the water works will receive proposals until May 30 for 4,100 tons of cast iron water pipe, classified as follows: 5,500 lineal feet, 590 tons of 20.inch pipe; 7,900 lineal feet, 610 tons of 16-inch pipe; 5,100 lineal feet, 250 tons of 12-inch pipe; 8,000 lineal feet, 300 tons of 10-inch pipe; 31,400 lineal feet, 880 tons of 8-inch pipe; 69,400 lineal feet, 1,220 tons of 6-inch pipe; 21,000 lineal feet, 250 tons of 4-inch pipe. J. D. Cook, Toledo, Ohio, Consulting Engineer.

FRANKLIN, MASS.—The Senate Committee on Water Supply and Drainage have reported a bill to incorporate the Franklin Water Company, capital $75,000.

A bill has passed the Connecticut House incorporating the Safford Springs Aqueduct Company.

FLORIDA.—The Okeechobee Drainage Company is progressing in draining the Florida peninsula. The work is done under contract with the State, and is under the charge of J. L. Kreamer, C. E.

MEXICO.—A company, with Hon. George B. Loring as president, has on hand the project of draining the valley of Mexico. Estimated cost of the undertaking, $10,000,000.

CONCORD, MASS.—The following bids for constructing a distributing reservoir were received by Wm. Wheeler, C.E., for a 2,000,000 gallon distributing reservoir for the town of Concord, Mass., April 7:

Conrad Juul, Danvers, Mass., $10,230.50; Richard Shanahan, Portland, Me., $10,233.25; Thos. Hennessey, Holden, Mass., $11,458.00; Hill & Ellinwood, Lowell, Mass., $12,953.00; John T. Langford, Newton, Mass., $13,942.00; A. F. Williams, Boston, $15,422.50; O'Connor & Carmody, Boston, $16,220.00; Henry H. Pike, Cambridge, $20,793.00; Geo. W. Hendrick, Easthampton, Mass., $23,215,50. The contract was awarded to Conrad Juul.

The following bids were received by Wm. Wheeler, C.E., April 7, for furnishing and laying 31,695 feet of wrought iron and cement pipe, 6 to 10 inches:

John E. Halladay, Jersey City, $28,336.75; Goodhue & Birnie, Springfield, Mass., $28,541.50; Conrad Juul, Danvers, Mass., $31,361.00; H. H. Pike, Cambridge, Mass., $43,160.00.

Bids for cast iron pipe, same quantity and dimensions, were received as follows:

John T. Langford, Newton, Mass, $35,195.75; Hill & Ellinwood, Lowell, Mass., $35,336.70; J. J. Newman, Providence, R.I., $36,900.75; Davis & Farnum Mfg. Co., $37,044.35; Conrad Juul, Danvers, Mass., $37,355.65; John E. Halladay, Jersey City, N. J., $38,567.35. John E. Halladay received the contract.

DAYTON, OHIO.—The following bids for cast iron pipe and special castings were received by M. R. Patrick, Governor, April 20, 1883, for sewer extension at the National Soldier's Home, near Dayton, O.: Cincinnati & Newport Iron and Pipe Co., $36 90 per ton, and 3¼ cents per lb.; A. H. McNeal, Burlington, N. J, $42.18 per ton, and 3½ cents per lb.; Dennis Long & Co., Louisville, Ky, $39 per ton, and 3½ cents per lb.; R. D. Wood & Co., Philadelphia, $37.50 per ton, and $3¼ cents per lb. The contract was awarded to the Cincinnati and Newport Iron and Pipe Co., of Newport, Ky.

CHICAGO.—E. W. Blatchford received the contract to supply 50 tons of pig lead to the city at $4.32½ for 100 pounds.

Bids as follows for an iron roof for the North Side Pumping Works have been received, and the first named will get the contract: H. A. Streeter, $22,722.50; Delaware Bridge Co., $23,744; Lassing & Alden, $25,400; Detroit Bridge Co., $24.570; Rust & Co, Rust & Coolidge, $24,762.

Proposals for dredging shallow places in Chicago River have been received from the Chicago Dredge & Dock Co., the Green Dredge Co. and Harry Fox & Co., at the following average prices respectively, for the nine sections of the river: 46⅓ cents for sounding; 46⅞ cents and 54 cents.

Abstract of proposals for the work on improvement of Hot Springs Creek, Ark., including rock and earth excavation, vitrified and iron sewer pipe, and granite masonry, opened at Interior Department, April 23, 1883. We give the bids for the pipe and the totals:

BIDDERS.	Vitrifi'd pipe. 12-inch.	Iron pipe. 12-inch.	Total.
Jay Marshal, Washington, D. C.	$7,150	$1,440	$62,070

No award yet.

YORKTOWN, VA.—The contract for building the monument at Yorktown, Va., has been given to the Hallowell Granite Company, of Maine. It will be ninety-seven feet high, and will cost $66,752.

The Cincinnati and Newport Iron and Pipe Co. have been awarded the contract for the water works at West Bay City, Mich.

The plumbing and heating of the new Powers hotel at Rochester, has been awarded to E. H. Cook & Co., of that city.

A bill apportioning $30,000 for an experimental lock on the Erie Canal was ordered to a third reading in the Senate, April 24.

ORGANIZATION OF NEW COMPANIES.—The Lancaster Manufacturing Company of this city, capital $250,000, for manufacture of stocks, dies and pipe tools. The U.S. Fire Escape and Fire Alarm Company, also of this city, capital $200,000.

The Sewer Gas Mercury Seal Co., of Philadelphia, has been chartered by the State of Pennsylvania as a stock company. Capital $60,000.

NEW YORK.—The following contracts were awarded at the Office of the Commissioners of Public Works, April 27:

For paving with granite-block pavement, and laying cross-walks, the following: King St., to W. Kelley for $17,082; Oliver St., to W. Kelley for $8,005; Jane St., to W. Kelley for $6,104: Watts St., to Thomas Gearty for $6,600.80; Mulberry St., to W. Kelley $10,512.50; 11th Avenue, to W. Kelley for $23,980.

For paving with trap-block pavement, and laying cross-walks, the following: Norfolk St., to W. A. Cumming for $14,035.30; West 11th St., to P. H. Fitzgerald for $2,467; 17th St., to M. Shannon for $15,830; 18th St., to W. A. Cumming for $3,042.50; 35th St., to P. H. Fitzgerald for $5,239; 35th St., to P. H. Fitzgerald for $4,692.60.

At the hall of the Board of Education, April 27, the contract for erecting two iron stairways to Grammar School-house, No. 18, was awarded to Matthias Benner for $3,577.80.

The Secretary of the Navy is about to receive proposals from American ship builders for one steel cruiser of 4,500 tons displacement, two steel cruisers of 3,000 tons displacement, and one dispatch boat of 1,500 tons displacement.

CHARLESTON, S. C.—After a series of unfortunate accidents in the sinking of a new well, the Water-Works Company, of Charleston, S. C., is now in a fair way to get an abundant supply of water.

In the Massachusetts Senate the Committee on Water Supply and Drainage, on the petition of the cities of Boston of Cambridge and the town of Andover, for leave to take the water of the Shawsheen River for a water supply, reported that they recommended further consideration of said several petitions be referred to the next General Court. They also recommend that as the Stony Brook basin in the towns of Waltham, Weston and Lincoln is a more desirable and economical water supply for Cambridge than the Shawsheen project, Cambridge, during the adjournment of the Legislature, ascertain the feasibility of adopting the same as an additional water supply for said city. The committee believe, moreover, that Boston and its contiguous cities and towns should be, in the matter of water supply and drainage, conducted under one comprehensive system, also that Boston reduce her present large waste of water before applying to the Legislature for an increase of water rights.

The Sheffield Highway Committee have issued a report recommending a complete scheme of sewerage and drainage for the borough, based upon utilizing the present sewers as far as possible. The cost is estimated at £147,500, and the system proposed is by filtration beds at Blackburn meadows.

The water revenue of Philadelphia in 1882 was $1,487,-967.71.

The Globe Telephone Company, filed articles of incorporation at Albany last week, for doing a telephone business throughout the United States, capital, $10,000,000.

The Electrical Refining and Manufacturing Company, of California, filed articles of incorporation March 28. Capital $600,000, all subscribed.

Henry R. Worthington, steam pump manufacturer, has removed the New York Office from 239 Broadway to 86 and 88 Liberty street.

Cammeyer & Sayer, manufacturers of Rider Hot Air Pumping Engines, formerly of 93 Liberty street, are now at 19 Dey street.

The George F. Blake Manufacturing Co. have removed from 88 Liberty street to 95 and 97 Liberty street, this city.

The Knowles Steam Pump Works have removed their salesrooms from 86 Liberty street to 93, on the same street.

The State Board of Health of Wisconsin, has issued a circular to town and village boards and common councils of cities calling their attention to chapter 167 laws of 1883, which makes the organization of boards of health and the appointment of health officers obligatory in every town, village and city of the State. The State Board urge the necessity of careful selection of the health officers, and they say—and this should be heeded by local boards—it will always be found both wise and economical to secure as health officer the best physician and sanitarian to be found in any given locality.

THE NEW JERSEY LAW AFFECTING WATER SUPPLY.

The following is the law of the State of New Jersey, to which we referred in our issues of April 12 and 26, when discussing the proposition to bring water from the Ramapo water shed. It will be noticed that this contemplates other actions than suits of individuals for damages.

STATE OF NEW JERSEY.

Sect. 3 (*of chap.* 186. *Laws of* 1883.)

And be it enacted, That said commissioners, whenever they deem such action necessary to preserve the rights of the State from infringement, may commence proceedings in the name of the State of New Jersey, to restrain any other State or any person, or any municipal or other corporation, from diminishing the flow, at the point where it enters this State, of any stream of potable water, by conducting away from such stream, or from sources lying within its water shed, and within the boundaries of another State, any portion of the waters naturally tributary to such stream, or from causing any injury to the waters flowing in such stream, or which are tributary thereto, so as to render such stream and waters, at the point where they enter this State, unfit for the supply of cities and towns for domestic use, and the Attorney-General is hereby required to commence and prosecute such actions as may be instituted or directed by said commissioners as aforesaid; and his expenses and disbursements, and the expenses and disbursements of such assistants as may be appointed by the Governor, and their reasonable charges and counsel fees shall be taxed by the Chief Justice and paid out of the State Treasury on presentation of the bill so taxed.

The act from which the above section, is quoted, was passed by the legislature of New Jersey, March 23, 1883, and is entitled. "An act to amend an act entitled an act to provide for the appointment of commissioners to determine upon plans for the storage of any of the waters of this State, for the purpose of furnishing to cities and towns a joint water supply. Approved March 31, 1882."

RECENT NEW JERSEY LEGISLATION.

An act prohibiting the sale of cigarettes or tobacco in any of its forms to minors.

1. Be it enacted by the Senate and General Assembly of the State of New Jersey, That hereafter no person or persons in this State shall knowingly sell any cigarette, or cigarettes, or tobacco in any of its forms, to any minor under the age of sixteen years.

2. And be it enacted, That if any person or persons in this, shall violate the provisions of this act, he, she or they shall be liable to a penalty of twenty dollars for each and every such offence; such penalty to be sued for by and in the name of the parent or guardian of such minor, in any court of competent jurisdiction in this State, such penalty to go to the county collector for the use of the county wherein the violation of this act occurs.

Approved March 22, 1883;

A Supplement to an act entitled "An act to regulate the practice of medicine and surgery," approved March 12, one thousand eight hundred and eighty, and a supplement thereto approved March second, one thousand eight hundred and eighty-one.

1. And be it enacted by the Senate and General Assembly of the State of New Jersey, That section two of said supplement, approved March second, one thousand eight hundred and eighty-one be, and the same is hereby amended so that the same shall read as follows:

2. And be it enacted, That any person who shall commence or continue to practice medicine or surgery without conforming to the requirements of the first section of this act, shall be deemed guilty of a misdemeanor, and on conviction shall be punished by a fine of twenty-five dollars, or imprisonment in the county jail not exceeding six months, or both, at the discretion of the court for each perscription made, operation performed, or professional service rendered; provided, that any person who shall have had twenty years experience in the practice of medicine or surgery in one locality, and shall file with the clerk of the county, in which he resides, an affidavit setting forth the fact of such experience and length of practice, shall be exempt from the requirements contained in section first of the act entitled "An act to regulate the practice of medicine and surgery, approved March twelfth, one thousand eight hundred and eighty.

2. And be it enacted, That in order to secure the State Board of Health a full record of all physicians and surgeons who, under the laws of this State, are required to give certificates of death, it shall be the duty of the county clerk of each county of the State, to furnish to the State Board of Health, a list of the names of all physicians and surgeons who have deposited with him copies of their diplomas, together with the date of their respective diplomas, and the name and place of the institution purporting to confer such diploma, and each county clerk shall yearly furnish to the State Board of Health a similar list of those physicians and surgeons hereafter depositing diplomas with him and shall include in such list also the names of those physicians and surgeons filing affidavits with him, as mentioned in the second section of this act; and each county clerk shall keep in a suitable book an index of the names of all physicians and surgeons depositing diplomas or filing affidavits in pursuance of this act or the acts to which this is a

Digitized by Google

supplement; and for every name indexed and furnished to the State Board of Health as hereinbefore provided, the county clerk so indexing and furnishing such name shall be entitled to receive from the State Board of Health, through its secretary, the sum of six cents.

3. And be it enacted, That this act shall take effect immediately.

Approved March 22, 1883.

Supplement to an act entitled "An act relating to local boards of health," approved March twenty-second, one thousand eight hundred and eighty one.

1. Be it enacted by the Senate and General Assembly of the State of New Jersey, That where local boards of health as existing in any township outside of city limits have been formed and exercise powers under an act entitled "An act concerning the protection of the public health and the record of vital facts and statistics relating thereto," approved March eleventh, one thousand eight hundred and eighty, or a supplement thereto entitled "A supplement to an act concerning the protection of the public health and the record of vital facts and statistics relating thereto," approved March thirty-first, one thousand eight hundred and eighty-two, or "An act relating to local boards of health," approved March twenty-second, one thousand eight hundred and eighty-one, said board shall be the only township board or authorities having powers relating to public health as defined in said acts.

2. And be it enacted, That in any city, town, borough or township board of health, constituted and exercising authority under these acts, the power to abate nuisances, sources of foulness or cause of sickness hazardous to the public health, shall not depend upon whether said board shall have exercised their power or privilege to pass, alter, amend or publish ordinances in relation to the public health.

3. And be it enacted, That where any township has no township physician, the State Board of Health may name some graduated physician of the same township, or, if there be none in the township, may name one of an adjacent township, who may be appointed for not more than three years, and who shall serve as a member of the board of health of such township; but if any such township come to have a township physician, said appointment shall be revoked by the State Board of Health.

4. And be it enacted, That every board of health now organized or to be hereafter organized in the cities of this State according to the provisions of the act entitled "An act relating to local boards of health," approved April twenty-second, one thousand eight hundred and eighty-one, under authority of any ordinances of such cities, shall be fully vested with all the rights and powers conferred by said act, and by this act entitled "A supplement to an act entitled 'An act concerning the protection of the public health and the record of vital statistics relating thereto,'" approved March eleventh, one thousand eight hundred and eighty, which supplement was approved March thirty-first, one thousand eight hundred and eighty-two, notwithstanding the charters of such cities, or of any of them, may provide for the exercise of the aforesaid rights and powers, or of any of them, by the board of aldermen or common council of such city, or by a committee thereof.

5. And be it enacted, That a notice by any inspector of any local board of health, to abate a nuisance, or by the executive officer or other authorized member of said board, shall be taken as a notice of the board, but if the owner or person concerned fail to abate the nuisance, the board of health, or a majority of its members, or of any committee thereof, shall view the nuisance before proceeding to abate it, and give such written directions to the inspector in reference thereto as they deem advisable under the law, and he or they shall proceed in accord therewith to abate said nuisance.

6. And be it enacted, That any county, city or township board of health shall have the authority to specify any contagious disease, or diseases in cases of death from which no public funeral shall be had, and to prohibit the same, under penalty of fifty dollars, or in case of the threatening or prevalence of an epidemic to make prohibition of the same as to the particular disease or diseases then prevalent, and any township board of health shall have the same power whenever the attending physician in writing advises the exercise thereof, or whenever any two physicians of the same county certify that they believe the interests of the public health require such restriction.

7. And be it enacted, That any board of health constituted under the act to which this is a supplement, or the acts referred to in section one of this act, may determine whether or when it is necessary for all physicians, or other persons in attendance of the sick, to notify said board of the existence of any contagious or infectious disease, and of which of said diseases it is necessary for the board to have this notification; but where such notification is required, the local board of health shall enter in a book, subject only to the inspection of said board, the name of the physician making such notification, and the date of the notice, the name and precise locality of the disease, and at the close of each six months, said physician shall be entitled to receive, on the certificate of said board, from the usual disbursing officer of said city or township, the amount of twenty-five cents for each and every notification, unless said notification has been found to have been erroneous.

8. And be it enacted, That in any county having a county board of health, this act shall not apply to any city or township of said county, without the consent or approval of the county board of health, nor to any city that has not organized or does not organize a board of health under "An act relating to local boards of health," approved March twenty-second, one thousand eight hundred and eighty-one, or the other acts referred to in section one, of this supplement thereto; and in case any city has or does by the vote or ordinance of its common council or other governing board, approved by the mayor, form a board under these acts, said vote or ordinance shall, as a part of the power of said city, under its charter, cause said board of health and its successors to become the board of health of said city, town or borough, as referred to or provided for in said charter.

9. And be it enacted, That whenever any board of health now organized, or which may be hereafter organized under laws of this State, as referred to in section one of this supplement to an act entitled "An act relating to local boards of health," approved March twenty-second, one thousand eight hundred and eighty-one, shall be notified that a nuisance or other source of foulness, hazardous to the public health, exists within the territory within which the board of health has jurisdiction or control, such board may examine the matter in a summary way and order and cause the same to be abated in the manner herein, or heretofore provided by law.

10. And be it enacted, That any such board of health, instead of proceeding in a summary way to abate a nuisance or such source of foulness, may file a bill in the court of chancery, in the name of the State, on the relation of such board of health, for an injunction to prohibit the continuance of such nuisance or source of foulness, and such action shall proceed in the court of chancery according to the rules and practice in such cases on the relation of individuals, and cases of emergency shall have precedence of other litigation pending at the time in the court of chancery, and may be heard upon final hearing on such notice as the chancellor shall direct.

11. And be it enacted, That in all cases in which it shall be ascertained by the court of chancery in such suits that a nuisance or source of foulness existed at the time of filing such bill, substantially as set forth in the same, the court shall have power to abate the same by injunction or otherwise, according to the practice of the court, and may charge the costs of such suit upon the property whereon such nuisance or source of foulness is found, and enforce the same by sale of said property on writ of *fieri facias*, or so much thereof as shall be necessary for that purpose, or the said court may order the person or corporation which caused said nuisance or source of foulness, or allowed the same to continue, to pay such costs, and enforce obedience to such order.

12. And be it enacted, That in case no nuisance or other source of foulness, hazardous to the public health, shall be found to exist, costs shall not be awarded as of course against the board of health which caused such suit to be brought, but only in case it shall appear to the chancellor that no probable cause existed for bringing such suit.

13. And be it enacted, That this act shall take effect immediately.

Approved March 22, 1883.

A Supplement to an act entitled "An act to prevent the adulteration of food or drugs," approved March twenty-fifth, one thousand eight hundred and eighty-one.

1. BE IT ENACTED *by the Senate and General Assembly of the State of New Jersey*, That section one of the act to which this is a supplement be amended so as to read as follows:

1. BE IT ENACTED *by the Senate and General Assembly of the State of New Jersey*, That no person shall manufacture, have, offer for sale or sell any article of food or drugs which is adulterated, within the meaning of this act, and any person violating any of the provisions of this act shall be liable to a penalty of fifty dollars for a first offence and one hundred dollars for a second or any subsequent offence.

2. *And be it enacted*, That section five of the act to which this is a supplement be amended to read as follows:

5. *And be it enacted*, That the State Board shall take cognizance of the interest of the public health as it relates to the sale of food and drugs, and the adulteration of the same, and make all necessary inquiries and investigations relating thereto; it shall also have the appointment and supervision of public analysts and chemists or inspectors to serve for general service, or for such special service or length of time as it may deem necessary; and the board health shall, from time to time, meet and adopt such measures as it may deem necessary for the enforcement of this act, and of the act to which it is a supplement, and prepare rules and regulations with the regard to the proper method of collecting and examining articles of food or drink or drugs; and the analysts, chemists or inspectors appointed may act singly or as associated in a council for such time as may be approved or authorized by said board.

3. *And be it enacted*, That section seven of the act to which this is a supplement be amended so as to read as follows:

7. *And be it enacted*, That any person violating any of the provisions of this act, and any person who shall hinder, impede, obstruct or otherwise prevent any analyst, inspector or prosecuting officer, in the performance of his duty, shall be liable to a penalty of fifty dollars for the first offence, and one hundred dollars for a second or subsequent offence.

4. *And be it enacted*, That every district court in any city, and every justice of the peace in any county, and any police justice or recorder in any city, is hereby empowered, on oath or affirmation made, according to law, that any person or persons who has or have violated any provision of the act to which this is a supplement, to issue process at the suit of any person or persons so charged, which process at the suit of any person, either in the manner of a summons or warrant, against the person or persons so charged, which process shall, when in the nature of a warrant, be returnable forwith, and when in the nature of a summons, shall be returnable in not less than one nor more than ten entire days; such process shall state what provision of the law is alleged to have been violated by the defendant or defendants, and on the return of such process or at any time to which the trial shall have been adjourned, the said court, justice of the peace, police justice or recorder, shall proceed to hear testimony and to determine and give judgment in the matter, without the filing of any pleadings; and the said court, justice of the peace, police justice or recorder shall, if judgment be rendered for the plaintiff, forthwith issue execution against the goods and chattels and person of the defendant or defendants; and the said court, justice of the peace, police justice or recorder is further empowered to cause any such defendant who may refuse or neglect to pay the amount of the judgment rendered against him and all the costs and charges incident thereto, unless an appeal is granted, to be committed to the county jail for any period not exceeding ninety days; but no district court of any city, justice of the peace, police justice or recorder shall have jurisdiction of any offence against the act to which this is a supplement, which offence shall take place outside of the territorial jurisdiction of such district court, justice of the peace, police justice or recorder, as such territorial jurisdiction is now established by law.

5. *And be it enacted*, That the officers to serve and execute all process under this act shall be the officers authorized by law to serve and execute process in said courts, and before such magistrates and officers as aforesaid, including the constables of such counties and all police officers of such cities.

6. *And be it enacted*, That all penalties imposed under the act to which this is a supplement shall be disposed of as follows: In case the suit is brought by an officer appointed by the State Board of Health, the penalty shall be paid into the treasury, this State; in case the suit is brought by any officer of any local board of health, or of any city, borough, town or township, the penalty shall be paid into the treasury of said local board of health, city, borough, town or township; in case of any suit not otherwise provided for, the penalty shall be paid to the person bringing the suit.

7. *And be it enacted*, That the State Board of Health shall be authorized to expend annually, in addition to all sums already appropriated for such board, an amount not exceeding one thousand dollars, for the purpose of including in its work the carrying out of the provisions of this act, and for the protection of the public health.

8. *And be it enacted*, That any analyst or inspector appointed by the State Board of Health, and any inspector or other officer of any local board of health, shall have power to inspect any article of food, or drugs, wherever exposed for sale, or offered, or held for sale, or whether in transit or otherwise; and if, upon inspection of such food or drugs, the same shall be found adulterated within the meaning of this act or the act to which this act is a supplement, the said inspector, or other officers aforesaid, shall have power and may prohibit the sale or disposal of said articles until decision shall be rendered by the court, justice of the peace, recorder, or police justice before whom the defendant may be brought.

9. *And be it enacted*, That this act shall not be so construed as to interfere with the special provisions of an act, approved March fourth, eighteen hundred and eighty-two, entitled "An act to prevent the adulteration, and to regulate the sale of milk."

10. *And be it enacted*, That this act shall take effect immediately.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

268,908. WING-GATE FOR FLUSHING SEWERS. SAMUEL JOHNSON, San Francisco, Cal. Filed June 5, 1882. (No model.) Issued Dec. 12, 1882.

Brief.—A brace bearing on the sewer-wall is hinged to a gate with beveled circumferential edge formed of a centre piece and wings (with the inner edges beveled to fit the centre piece at a certain angle) secured thereto by flexible strips. A circumferential flexible strip renders the gate water-tight, while an extension-bar on the centre piece may be wedged or braced against the sewer-wall.

Claim.—1. A sewer-gate, A B, having the exterior edges curved and beveled, so as to fit the sides of the sewer when the gate stands at an angle, and provided with the flexible flaps D around the edges, and the inclined brace E, standing at an angle so as to brace against the side or bottom of the sewer and retain the angularly placed gate, substantially as herein described.

2. A sewer-gate consisting of the centre piece A, and the wings B, beveled to fit, and having their meeting-edges hinged together by flexible strips C, and their exterior edges provided with flexible flaps D, in combination with the hinged brace E and the standard or bar F, wedged or braced against the top of the sewer, substantially as and for the purpose herein described.

3. A sewer-gate consists of a vertical central piece, A, having a brace E, by which it may be fixed within the sewer, in combination with two or more wings, B or B, hinged to the central piece by flexible water-tight strips C, and having exterior projecting flaps, D, so that said gate may be folded for introduction or removal, and when opened will form a tight dam within the sewer, substantially as herein described.

268,914. RAIN-WATER CUT OFF. GEORGE LEMLE, New Orleans, La. Filed Mar. 21, 1882. (No model.) Issued Dec. 12, 1882.

Claim.—1. In a rain-water cut off, in combination, the slanting conducting-pipe D, the cistern B, and the intermediate cut-off tank, C, so arranged under the pipe D that said tank C must be filled with water by said pipe D before the pipe can carry water into the cistern, as shown and described.

2. In a rain-water cut-off, in combination, the cistern B, the cut-off, tank C, and the slanting conducting-pipe D, provided with an enlargement or offset H, as shown and described.

268,917. PIPE-COUPLING. WILLIAM MARTIN, Tidioute, Pa., Filed May 1, 1882. (No model.) Issued Dec. 12, 1882.

Claim.—1. In a pipe-coupling, a pipe, A, provided with a ball, B, and a pipe D, provided with a hemispherical shell C, combined with an incasing shell and a nut H.

2. In a pipe-coupling, a screw-threaded pipe, A, having a ball, B, and a pipe, D, having a hemispherical shell, C, combined with a divided incasing shell, F G, and a nut H.

3. A pipe-coupling composed of the pipe A, provided with ball B, the pipe D, provided with a hemispherical shell C, and the divided incasing shell F G, the ball being beveled in the rear, whereby an oil-chamber is provided, substantially as set forth.

269,011. PIPE-COUPLING. THOMAS B. CLATWORTHY, New York, N. Y., assignor to Abendroth & Root Manufacturing Company, same place. Filed November 3, 1882. (No model.) Issued December 12, 1882.

Claim.—1. The pipe coupling composed of an inner ring of wrought iron and an outer ring of cast iron, having an internal flange; which is secured by casting upon the inner ring, thereby forming two annular sockets for the reception of the pipe, substantially as described.

2. The pipe coupling composed of an inner ring of wrought iron and an outer ring of cast iron, coned or tapered internally and having

an internal flange, which is secured by casting upon the inner ring, thereby forming two annular dovetailed sockets for the reception of the pipe, substantially as described.

269,072. PIPE WRENCH. JOHN LEE, Mansfield, assignor to the Russell Wrench and Novelty Company, Russell, Ohio. Filed October 18, 1882. (No model.) Issued December 12, 1882.

Claim.—1. The combination, in a pipe-wrench, of the shank, the fixed jaw having an angular recess, the sliding jaw having a dovetailed lug at its outer end for a portion of its length, and the tooth wedge having a dovetailed recess extending from its outer toward its inner end, whereby it may be fitted to slide upon and beyond and yet be firmly retained upon the face of the sliding jaw, as set forth.

2. As an improvement in pipe-wrenches, the combination of the shank, the fixed jaw, the sliding jaw, and sliding wedges mounted upon the faces of the fixed and sliding jaws, and provided respectively with a curved or angular recess and with transverse teeth or ratchets, the said wedges being faced in opposite directions, as set forth.

269,073. WRENCH. JOHN LEE, Mansfield, assignor to the Russell Wrench and Novelty Company, Russell, Ohio. Filed October 18, 1882. (No model). Issued December 12, 1882.

Claim.—1. In a wrench, the combination, with the stem or shank having a fixed jaw, of the sliding jaw D, having beveled recess H, and screw K, provided with handle L and annular groove M, and the wedge I, having claws N, as and for the purpose set forth.

2. In a wrench, the combination, with the sliding jaw D, having beveled recess H, of the wedge I, having claws N, the screw K, having annular groove M and handle L, provided with thumb piece Q and recess P, and the spring O, as and for the purpose set forth.

269,111. GLOBE-VALVE. GEORGE REIMANN, Quincy, Ill. Filed May 4, 1882. (No model.) Issued December 12, 1882.

Claim.—The cock described, having the shell or casing A, with the horizontal and vertical portions, as described, the thimble B, the guide ring C, plug D, cap E and screw stem F, all combined and arranged as and for the purpose described.

268,655. OIL-LAMP STOVE. GEORGE H. FERRIS, Brooklyn, N. Y. Filed Nov. 16, 1877. Issued Dec. 5, 1882.

268,661.—UNDERGROUND TELEGRAPH. LEVI HAAS, Chester, Pa. Filed July 3, 1882. (No model.) Issued Dec. 5, 1882.

268,675. DOUBLE ACTING PUMP. JAMES W. HILLIKER, St. John's, Mich. Filed Mar. 15, 1882. (No model.) Issued Dec. 5, 1882.

268,676. STEAM-PUMP. WILLIAM HOPKINS, Dubuque, Iowa. Filed May 9, 1882. (No model.) Issued Dec. 5, 1882.

268,682. SMOKE-CONSUMING FURNAGE. PETER H. JACKSON, San Francisco, Cal. Filed June 29, 1882. (No model.) Issued Dec. 5, 1882.

268,686. MEANS FOR FASTENING HYDRANT TOPS, ETC. WILLIAM KAISER, Wilkes-Barre, Pa. Filed Apr. 6, 1882. (No model.) Issued Dec. 5, 1882.

268,718. HEATING-STOVE. JOHN B. OLDERSHAW, Baltimore, MD. Filed Aug. 14, 1882. (No model.) Issued Dec. 5, 1882.

268,727. HYDROCARBON-ENGINE. WATSON F. QUINBY, Wilmington, Del. Filed Apr. 20, 1882. (No model.) Issued Dec. 5, 1882.

268,750. GARBAGE RECEPTACLE. DAVID D. TOAL, New York, N. Y. Filed Sept. 20, 1882. (No model.) Issued Dec. 5, 1882.

268,751. HOT-AIR FURNACE. JOSEPH TRAVIS, Philadelphia, Pa. Filed Apr. 28, 1882. (No model.) Issued Dec. 5, 1882.

268,770. CHIMNEY-FLUE. CHARLES BUEK, New York, assignor to G. W. Rader & Co., same place. Filed Sept. 22, 1882. (No model.) Issued Dec. 5, 1882.

268,777.—VAPOR-BURNER. JAMES R. BAKER, Kendalville, Ind. Filed June 30, 1882. (No model.) Issued December 12, 1882.

268,784. WRENCH. BERNARD DONOHUE, Yonkers, N. Y. Filed April 14, 1882. (No model.) Issued Dec. 12, 1882.

268,792. RACHET-WRENCH. JOHN B. HALBERT, Maitland Fla. Filed Aug. 1. 1882. (No model.) Issued Dec. 12, 1882.

268,816. ROTARY DIFFERENTIAL FORCE-PUMP. PETER MUNZINGER, Phila delphia, Pa. Filed Jan. 23, 1882. (No model.) Issued Dec. 12, 1882.

268,824. HYDROCARBON-BURNER. RANSOM F. RANKIN, Columbus, Ohio. Filed April 29, 1882. (No model.) Issued December 12, 1882.

268,832. PUMP. WILLIAM SELLERS, Philadelphia, Pa. Filed Feb. 27, 1882. (No model.) Issued Dec. 12, 1882.

268,833. STOVE. JOHN SINNAMON, Oswego, N. Y. Filed Sept. 7, 1882. (No model.) Issued Dec. 12, 1882.

268,842. PUMP. BENAJAMIN C. VANDUZEN, Cincinnati, Ohio, assignor to Herbert D. Lafferty, Nashville, Tenn., and Stanley B. Lafferty, Davcnport, Iowa. Filed May 26, 1882. (No model.) Issued Dec. 12, 1882.

268,843. PUMP. BENJAMIN C. VANDUZEN, Cincinnati, Ohio, assignor to Herbert B. Lafferty, Nashville, Tenn., and Stanley B. Lafferty, Davenport, Iowa. Filed May 26, 1882. (No model.) Issued Dec. 12, 1882.

268,844. PUMP. BENJAMIN C. VANDUZEN, Cincinnati, Ohio, assignor to Herbert D. Lafferty, Nashville, Tenn., and Stanley B. Lafferty, Davenport, Iowa. Filed May 26, 1882. (No model.) Issued Dec. 12, 1882.

268,845. PUMP. BENJAMIN C. VANDUZEN, Cincinnati, Ohio, assignor to Herbert D. Lafferty, Nashville, Tenn., and Stanley B. Lafferty, Davenport, Iowa. Filed April 29, 1882. (No model.) Issued Dec. 12, 1882.

268,857. RANGE. CHARLES H. BLANCHARD, Batavia, Ohio. Filed June 16, 1882. (No model.) Issued Dec. 12, 1882.

268,860. CHIMNEY. JEREMIAH BROWELL, San Francisco, Cal. Filed March 7, 1882. (No model.) Issued Dec. 12, 1882.

268,863. PROCESS OF AND APPARATUS FOR GENERATING GAS. WILLIAM FRANK BROWN, New York, N. Y. Filed June 30, 1881. (No model.) Issued Dec. 12, 1882.

268,871. VAPOR-STOVE. RODERICK F. DANFORTH, Washington, D. C. Filed May 9, 1882. (No model.) Issued Dec. 12, 1882.

268,881. EAVES-TROUGH. CHARLES R. EVERSON, Macedon, N. Y. Filed June 2, 1882. (No model.) Issued Dec. 12, 1882.

268,889. FURNACE-DOOR. HARRIS HIGGINS, Chicago, Ill. Filed Oct. 13, 1882. (No model.) Issued Dec. 12, 1882.

268,910. CARBURETOR. AUGUSTUS W. LACY, Attleborough, Mass. Filed July 21, 1882. (No model.) Issued Dec. 12, 1882.

268,918. ADJUSTABLE TUBE-EXPANDER. NEIL G. MCINTYRE, Brooklyn, N. Y., assignor of seven-eighths to Warren W. Sheppard, Jessie McIntyre, Catharina Herbst, and Robina R. Hedges, all of same place. Filed Mar. 27, 1882. (No model.) Issued Dec. 12, 1882.

268,921. COOKING AND HEATING STOVE. FRANK METZNER, Chicago, Ill. Filed Sept. 11, 1882. (No model.) Issued Dec. 12, 1882.

268,923 STEAM-BOILER. GEORGE MILES, Wellesley Hills, Mass. Filed Mar. 4, 1882. (No model.) Issued Dec. 12, 1882.

268,929. GAS-METER. PEDRO ENRIQUE PEREZ, Valparaiso, Chili. Filed June 21, 1882. (Model.) Issued Dec. 12, 1882.

268,933. APPARATUS FOR VAPOR BATHS. ERASTUS POND, Portsmouth, Ohio. Filed Sept. 26, 1882. (No model.) Issued Dec. 12, 1882.

268,935. COOKING ATTACHMENT FOR OIL-STOVES. MARION E. PORTER. Leon, Iowa. Filed Sept. 20, 1882. (No model.) Issued Dec. 12, 1882.

268,956. DYNAMO-ELECTRIC MACHINE. ELMER A SPERRY, Courtland, N. Y. Filed Apr. 28, 1881. (No model.) Issued Dec. 12, 1882.

268,971. WATER-FILTER. PHILLIPS ABBOTT, Brooklyn, N Y. Filed Jan. 10, 1882. (No model.) Issued Dec. 12, 1882.

268,980. ARMATURE FOR DANAMO-ELECTRIC MACHINES. FOREE BAIN, Union City, Ind., assignor to the Fisher Electric Company, same place. Filed July 26, 1882. (No model.) Issued December 12, 1882.

268,984. FORCE PUMP. JOHN BEDFORD, Rossville, Tenn. Filed April 14, 1882. (No model.) Issued December 12, 1882.

268,999. EXTENSION GAS FIXTURE. JOHN F. BROWN, Brooklyn, assignor to Charles F. Oxley and Silas M. Giddings, New York, N. Y. Filed June 14, 1882. (No model.) Issued December 12, 1882.

269,022. APPLIANCE FOR GALVANIZING. HENRY CULL, Johnstown, Pa. Filed September 14, 1881. (No model.) Issued December 12, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an urban population of 5,273,531, there died during the week ending April 21, 2,453 persons, which is equivalent to an annual death rate of 24.2 per 1,000. A slight increase over the preceding week, for which it was 24.

For the North Atlantic cities the rate was 23.7; for the Eastern cities 25.2; for the lake cities 22.8; for the river cities 20.3; and in the Southern cities, for the whites, 20.9; and for the colored, 37.7 per 1,000.

Of the whole number of deaths 35.3 per cent. were under five years of age. Accidents caused 2.8 per cent. of all deaths, the proportion rising to 5.4 per cent. among the Southern whites.

Consumption caused 14.4 per cent of all deaths. In the North Atlantic cities it caused 15.3; in the Eastern cities, 15.4; in the lake cities, 11.2; in the river cities, 14.0; and in the Southern cities, for the whites 8.4, and for the colored, 10.1 per cent.

Croup caused 1.5, diarrhœal diseases 1.4, and diphtheria 3.1 per cent. of all deaths. In the North Atlantic cities diphtheria caused 2.5; in the Eastern cities, 3.4; in the lake cities, 6.0; in the river cities, 1.8; and in Southern cities, 1.2 among the whites, and .6 per cent. among the blacks. Typhoid fever caused 1.4 per cent. of all deaths. In the North Atlantic cities it caused 2.8; in the Eastern cities, 1.4; in the lake cities, 1.2; in the river cities, .6; and in the Southern cities among the whites, 1.8 per cent. Scarlet fever caused 3.3 per cent. of all deaths. The proportion rising to 5.6 per cent. in the lake cities. Pneumonia caused 11.9 per cent. of all deaths, the highest ratio being in the Eastern cities, where it caused 13.3, and the lowest in the Southerin cities, where it was for whites 7.2, and for colored 7.6 per cent. Measles caused 1.5; puerperal diseases, 1.1; small-pox, 2.8, and whooping cough .9 per cent. The high rate of small-pox is due to its prevalence in New Orleans, where it caused 22.2 per cent. of all the deaths among the whites, and 38.8 of all deaths among the colored.

BOSTON, MASS.—C. E. Davis, Jr., Clerk, reports 14 cases of diphtheria, 20 of scarlet fever, six of typhoid, and one of small-pox.

Digitized by Google

BUFFALO, N. Y.—Dr. Phelps reports seven cases of small-pox in the city.

PATERSON, N. J.—Dr. Wm. K. Newton reports a case of small-pox imported from Philadelphia, Pa.

DISTRICT OF COLUMBIA.—Health Officer Townshend reports one case of small-pox.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 24 new cases of scarlet fever, and 12 of diphtheria. Including these, there are now under treatment 62 cases of the former disease, and 24 of the latter.

DETROIT, MICH.—Dr. O. W. Wight reports seven new cases of scarlet fever, and 21 of diphtheria.

PITTSBURGH, PA.—Dr. Wm. Snively reports two cases of small-pox.

DAYTON, O.—Dr. E. B. Davis reports two cases of small-pox.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths, two of which were in persons under five years of age. One of the deaths was caused by measles.

PROVIDENCE, R. I.—Dr. E. M. Snow reports that "although the number of deaths during the week was considerably above the annual weekly average, there was a remarkable decrease in the number from zymotic causes. The new cases of typhoid fever and pneumonia are rapidly decreasing, and it is probable that, as the weather grows warmer, the mortality from these two diseases will nearly, though not entirely, cease."

BOSTON, MASS.—The Board of Health has ordered that cases of death from small-pox, diphtheria, scarlet fever, typhoid or typhus fevers, must be immediately wrapped in a sheet saturated with a ten per cent. solution of chloride of zinc, and placed in a coffin which must be made absolutely tight, and which must not be re-opened.

BALTIMORE, MD.—The Board of Health gives the following as the annual rates estimated on the mortality for the week ending April 21: Whole population, 19.65; white, 16.09; colored, 40.73. The total number of deaths was 155; of these 77 were of males, and 78 of females; 58 of persons under five years, and 24 of persons over 60 years of age. Accidents caused two deaths, consumption 26, croup two, diarrhœal diseases one, diphtheria 12, erysipelas two, malarial fevers three, scarlet fever six, pneumonia 20, congestion of lungs three, bronchitis two, measles one, and small-pox six.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELLS ISLAND.—Dr. T. M. Franklin, reports 1,360 insane persons remaining under treatment April 21. The changes reported during the week are, admissions 14, discharges two, and deaths one.

RAVENNA, OHIO.—Postmaster W. S. Krake, reports the sanitary condition of the district as good, although a mild type of scarlet fever is prevailing.

MICHIGAN.—The report of Dr. H. B. Baker, Secretary State Board of Health, shows the prevalent diseases during the week ending April 14, to have been bronchitis, neuralgia, rheumatism, intermittent fever, tonsilitis, pneumonia, and consumption. Pneumonia and whooping cough increased while measles decreased in area of prevalence during the week. Diphtheria was reported present at nine places, scarlet fever at 18 places and measles at 23 places. One case of measles came with immigrants arriving at Port Huron April 12.

NEW ORLEANS, LA.—The Board of Health reports for the week ending April 14, shows 175 deaths; white 89, colored 86; equivalent to an annual rate of 41.05 for the total population, of 28.28 for the white, and of 74.59 for the colored.

White.—Deaths under five years 13; over 60 years nine. Small-pox caused 32 of the 89 deaths, malarial fevers five, diarrhœal diseases five, consumption 11, pneumonia four, gangrene of the lungs one, and violence two.

Colored.—Deaths under five years 26; over 60 years seven. Small-pox caused 45 of the 86 deaths, typhoid fever one, malarial fever one, diphtheria one, consumption seven, bronchitis one, and pneumonia four.

CALIFORNIA.—The monthly circular of the State Board of Health (F.W. Hatch, M.D., Secretary) for March gives statistics from twenty localities, not including San Francisco. The deaths reported numbered 181, which is equal to an annual rate of 14.04. There is a very general exemption from zymotic diseases, although whooping cough is said to be somewhat prevalent at Sacramento, Modesto and Los Angeles, measles at Williams, and varicella and mumps at College City. Small-pox is localized at Nevada and Napa cities, and it is thought that the prompt and energetic measures adopted in these cities have effectually arrested its progress. These measures have been vaccination, isolation, and attention to cleanliness.

ONTARIO, CANADA.—During the week ending April 14, influenza has decreased, while intermittents have made a decided advance. Both of these changes are attributed by the *Provincial Bulletin* to the milder weather recently experienced. The retrogression of measles, noticed last week, has continued, but the disease still forms as much as 5.6 per cent. of the total cases of sickness reported. On account of an increase in the area of prevalence of diarrhœa the *Bulletin* urges the prompt removal of all deposits of organic materials which may have accumulated during the winter.

NEW HAVEN, CONN.—The annual report of the Board of Health, for the year 1882, shows a mortality of 1,343 exclusive of still-births, of which there were 70. Estimating the average population at 72,000, which is said to be an under rather than an over-estimate, the death rate per 1,000 is 18.65. The death rate for 1881 was 19.1, and average rate of the past fifteen years 19.06. The births numbered 2,088, but a complete registration of the births has not been secured. Of the decedents, 1,294 were white and 49 colored persons; 461 were under five years of age, and 283 were over 60 years.

Measles caused 10 deaths, scarlet fever 11, diphtheria and croup 60, whooping cough 17, erysipelas two, diarrhœal diseases 130, of which 99 are recorded as infantile diarrhœa, cerebro-spinal meningitis three, typhoid fever 24, malarial fevers 38, consumption 203, bronchitis 32, pneumonia and congestion of lungs 99, puerperal fever nine, and violence 64. No death occurred from small-pox during the year, and only two fatal cases of this disease have been recorded since 1876.

"There are, as has been ascertained by actual count, more than 1,100 pupils now in our public schools not protected *at all* by vaccination, and nearly 1,000 more over 12 years who have not been vaccinated in five years. Therefore it is reasonable to believe that there is also an element of good luck in the long-continued exemption of our citizens from this disease, while there are so many among us liable to its contagion, and while we are so peculiarly exposed."—*Dr. C. A Lindsley, Health Officer.*

HAVANA, CUBA.—During the month of March there were 662 deaths in the city, 23 of which were caused by yellow fever, 10 by typhoid fever, 10 by malarial fever, one by diphtheria, six by croup, one by scarlet fever and nine by measles. Measles is stated by Dr. D. M. Burgess, in his report, as prevailing extensively and being of unusual malignancy. "The weather has been excessively hot for the past eight days, and as quite a number of fresh troops are arriving by the Spanish mail steamers, the prospects are that these will become victims of yellow fever shortly."

Later advices, dated April 21, report 12 deaths by yellow fever in the city during the week which ended on the 20th inst. These deaths occurred in the military hospital. There are no cases of yellow fever among the merchant shipping. For the past week the weather has been pleasantly cool and it is difficult from any available data to prognosticate with regard to the epidemicity of the fever during the coming summer.

ENGLAND.—During the week which ended April 7, the annual rate of mortality in the 28 great towns averaged 26.1 per 1,000 of their population. Salford gave the smallest rate, 18.1, and Manchester the largest, 35.7. In Huddersfield and Norwich no deaths were registered from any of the principal zymotic diseases. The 24 deaths from diphtheria in the 28 towns included 20 in London. Small-pox caused one death in London and one in Newcastle-on-Tyne, but not one in any of the twenty-six other towns.

London.—Births 2,928; deaths 1,940. The births exceeded by 147 and the deaths by 131 the average numbers in the corresponding weeks of the last ten years. The annual rate was 25.6. Small-pox caused one death. Seven new cases of small-pox were admitted to the hospitals during the week, making the number remaining under treatment at its close 82. Measles caused 51 deaths, scarlet fever 15, diphtheria 20, whooping cough 42, typhus three, typhoid fever 13, diarrhœa and dysentery nine, and violence 58.

PARIS, FRANCE.—There were 1,312 deaths during the week which ended April 5: males 697, females 615; under five years 364, over 60 years 321; annual rate 30.44. Typhoid fever caused 27 deaths, small-pox nine, measles 31, scarlet fever one, whooping cough 11, diphtheria and croup 44, erysipelas five, puerperal infection three, consumption 250, acute bronchitis 57, pneumonia 145 and violence 39.

There remained under treatment in the hospitals on April 1, 102 cases of small-pox, 242 of typhoid fever and 36 of diphtheria.

RHEIMS, FRANCE.—Consul John L. Frisbie's report for the week ending March 31, shows the occurrence of 68 deaths; under five years 23, over 60 years 16. Annual rate 37.68. No death was reported from small-pox, scarlet fever, measles, whooping cough, erysipelas or puerperal infection. Croup and diphtheria caused two deaths; typhoid fever three, bronchitis 13, pneumonia four, consumption 10, diarrhœal diseases five and violence four.

SCOTLAND.—During the week ending April 7, the death rate in the eight principal towns was 29.4 or 7.3 above that of the corresponding week of last year. The lowest rate was recorded in Paisley, 17.2, and the highest in Glasgow, 32.9. Whooping cough continues to be the most fatal epidemic; 19 deaths from this disease were registered in Glasgow and 14 in Dundee. Of 27 deaths from measles which occurred in the eight towns, 24 took place in Glasgow.

Edinburgh.—Total deaths 119; rate 26.2. Small-pox none, measles and scarlet fever one each, typhoid fever and diarrhœal diseases two each, diphtheria five, whooping cough four, and acute lung diseases 26.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the registrar-general for the week ending April 7, for a summary of which see table in this issue.

Dublin.—Total deaths 263; rate 39.1. No death is registered from small-pox, measles or diphtheria. Scarlet fever caused one death, typhus seven, typhoid fever four, whooping cough 12, diarrhœa two, consumption 34, acute lung diseases 70 and violence four.

Belfast.—Total deaths 120; rate 29.2. No death is registered from small-pox, measles or typhus. Scarlet fever caused five deaths, whooping cough six, diphtheria, typhoid fever and violence one each, diarrhœal diseases four, consumption 20 and acute lung diseases 38.

COPENHAGEN, DENMARK.—During the week which ended March 27, there were 148 deaths recorded; under five years, 59; over 60 years, 35; annual rate 24.76. No death was registered from small-pox, measles, erysipelas or puerperal fever. Scarlet fever caused three deaths, diphtheria two, croup one, whooping cough four, typhoid fever four, diarrhœa six, consumption 24, pneumonia nine, pleurisy one, capillary bronchitis 10 and violence one.

During the same week there were reported 17 cases of scarlet fever, four of diphtheria, five of croup, 45 of whooping cough, three of typhoid fever, 83 of diarrhœa, 19 of erysipelas, one of puerperal fever, 368 of bronchial catarrh, 11 of influenza, 58 of pneumonia and 131 of tonsilitis. No cases of small-pox or measles were reported.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 77 deaths for the week ending March 24; males 40, females 37; under five years 34, over 60 years 15. Annual rate 23.0 per 1,000. Measles caused two deaths, scarlet fever four, croup and diphtheria two, whooping cough three, typhus and puerperal fever one each, typhoid fever two, diarrhœa five, consumption 11, pneumonia eight, bronchitis seven and violence one.

The cases reported during the week which ended March 31 were: small-pox one, measles 20, scarlet fever 14, whooping cough five, erysipelas four, diphtheria 15, typhoid fever two, diarrhœa 12, tonsilitis 10, pneumonia 12, pleurisy three and bronchitis 71.

BRUSSELS, BELGIUM.—During the week ending [illegible] curred 276 births and 238 deaths in the city and its [illegible] figures are equal to the respective annual rates of [illegible] 1,000. The deaths of children under five years numbered [illegible] death was recorded from scarlet fever, whooping cough [illegible] diphtheria. Small-pox caused two deaths, measles five, typhoid [illegible] two, diarrhœal diseases 18, bronchitis and pneumonia [illegible] sumption 39.

ROTTERDAM, NETHERLANDS.—The report of Consul Jno. [illegible] ters, for the week ending April 7, shows the continuance of [illegible] infection at that port. Seven deaths were recorded from [illegible] during the week and 26 new cases were reported.

VIENNA, AUSTRIA.—Consul-General Jas. R. Weaver's report [illegible] week ending March 24 shows 447 deaths, equal to an annual rate of 31.0. Of the deaths 112 were due to consumption, 79 to acute [illegible] diseases, one to small-pox, two to scarlet fever, five to diphtheria, seven to whooping cough and one to typhoid fever. The deaths of children under five years numbered 166.

BARCELONA, SPAIN.—Consul Fred. H. Schench reports that there were 38 deaths from small-pox during the week ending March [illegible] total mortality of 251; population 251,000.

CALCUTTA, INDIA.—Consul-General Mattson's report for the week ending Jan. 27 shows 299 deaths giving a ratio of 36.0 as compared with 42.1 during the previous week. The general death rate is somewhat above the average; the cholera rate is lowered but still remains above the mean of past years. Of the 299 deaths cholera caused [illegible] fevers 91, bowel complaint 45, tetanus 21, consumption 10 and accidents seven.

During the following week (ending Feb. 3) the deaths numbered 281, giving a rate of 33.8. Cholera is reported as waning but still the death rate from this cause is higher than usual. Of the 281 deaths cholera caused 27, fevers 90, bowel complaints 46, tetanus [illegible] consumption 11 and violence two.

The report for the month of December shows that 1,596 deaths were registered against 1,244 in the preceding month, giving a rate of [illegible] against 34.4. The total exceeds the decennial means by 83, the excess being chiefly due to the increase of deaths from cholera. Although this disease prevailed with unusual severity in the northern sections of the town its incidence was sporadic. It caused 411 deaths against [illegible] in the preceding month. The births registered during the month numbered 683.

The report for the fourth quarter of the year 1882 shows 3,991 deaths while the means of the corresponding quarters of the preceding decade was 4,003. Fevers caused 312 deaths, mean of decade 415; cholera 734, mean 361; dysentery and diarrhœa 503, mean 544; small-pox two, mean 13. Nine of the deaths from fever were registered under the term typhoid. In no fourth quarter of the preceding decade has the cholera mortality been so large as in 1882. A similar excess of cholera mortality occurred in the districts around Calcutta.

MADRAS, INDIA.—During the week ending Feb. 23, 262 deaths were registered; males 135, females 127; rate of mortality 34.2 per mille. per annum. Small-pox caused 14 of the deaths, measles seven, fevers 61, dysentery 22, and diarrhœa 20. No death was registered as from cholera.

BOMBAY, INDIA.—Consul B. F. Farnham reports 556 deaths for the week ending Feb. 20, being 48 more than the mean of the corresponding periods in the preceding five years. Annual rate 34.88. There were 87 deaths from remittent fever, 83 from diseases of the respiratory system, 23 from diarrhœa, and 17 from dysentery. The deaths from small-pox during the week were 94, being six more than during the preceding week. There has been no death from this cause among Europeans yet. The number of deaths has gone on increasing from week to week since the epidemic declared itself, but the advance is not nearly so marked this week.

MADRAS, INDIA.—During the week ending Feb. 16 there were 276 deaths registered; males 157, females 119; annual rate 36.1. Small-pox caused 18 of the deaths, measles two, fevers 76, dysentery 21, and diarrhœa 17. No death was registered as having been caused by cholera.

COLOMBO, CEYLON.—Small-pox continues fatal. During the two weeks ending Feb. 17 there were 16 deaths from this disease.

SIDNEY, NEW SOUTH WALES.—Vice-Consul F. H. Boyd transmits the return of the registrar general for the month of December. The births numbered 775 and the deaths 514. In the city 229 death occurred; males 124, females 105; under five years, 100; population 103,379. In the suburbs 285 deaths were registered; males 164, females 121; under five years 177; population 120.832 Diarrhœal diseases continue to be fatal, there having been 23 deaths occasioned by them in the city, and 47 in the suburbs.

BRISBANE, NEW SOUTH WALES.—There were 109 deaths registered during the month of December in the city and suburbs; males 64, females 45; under five years, 69; population 33.068. Of the 109 deaths, zymotic diseases caused 46, but the return does not particularize the diseases.

NEW ZEALAND.—The Registrar-General's return for the month of January shows the occurrence of 251 deaths in 16 towns, giving an annual mortality rate varying from 10.56 in Wanganui to 18.78 in Napier. The births during this period numbered 525. Dysentery was the most fatal of the zymotic diseases.

MELBOURNE, AUSTRALIA.—The births registered in December numbered 712, viz., 350 boys and 362 girls. This total is slightly below the average of the past eight years. The deaths numbered 581 or 75 above the average of December during the past ten years; males 321, females 260. Children under five years constituted 48 per cent. of the total. The deaths of 20 persons who had attained the age of 75 years, or upwards, are recorded. Measles, scarlet fever, diphtheria, croup and whooping cough, each caused one death, typhoid fever 11, erysipelas five, dysentery 13, diarrhœa 92, cholera three, consumption 50, bronchitis eight, pleurisy three, pneumonia 14, congestion of lungs three, and violence 26.

BOARD OF HEALTH NOTES.

NEW YORK.—Ten violations of the plumbing regulations were reported to the Health Department of this city during the week ending April 21, by the following inspectors: Messrs. Hooper and Hollick, three each; Messrs. Golden, Eagleson, Hicinbothem and Dickinson, one each. One of the cases reported by Inspector Hollick was of a very serious character, as follows: In the house on the north side of 75th street, 100 feet west of First avenue, (numbered 341), owned by Chas. Buddensick (or Budinsick), the house drain was not laid; the house was partially occupied, and the soil pipe was discharging all soil and waste into the cellar, while the leader discharged into the yard and area. Two violations of light and ventilation plans were reported during the same week.

During the week ending April 28, fifteen plumbing violations were reported, as follows: By Inspector Dickinson, six; by Elliot, four; by Hooper, three, and by Hollick, two. Most of the cases were not very serious. The worst was that of one sewer connection for five houses (on the south side of 97th street, 100 feet east of Third avenue, owned by Samuel Simmons) reported by Inspector Hollick. Ten cases were referred to the attorney during the week. There were no violations of light and ventilation plans.

A case of typhus fever was reported from Bellevue Hospital on April 20 and transferred to the Reception Hospital and thence to Riverside. The case came from the rear house, No. 747 Sixth street. On an immediate examination of this place, the physician of the Health Department found a young woman very sick of the same disease; and that in a family living just across the hall from her, four children had recently been sick with a disease having every symptom, as reported, of typhus, but were now well. From these previous cases, which had not been reported to the Health Department, though visited by a dispensary physician, the two existing cases are supposed to have sprung. The second case was also removed at once to Riverside Hospital.

During last week there was considerable excitement about an outbreak of typhus fever at St. Stephen's Home for children on East 28th street. The facts regarding it are, briefly, as follows: On Saturday, April 21, ten girls between the ages of five and nine were sent from the Home to Bellevue. Their disease was there pronounced scarlatina and the Health Department notified to remove them to the contagious diseases hospital. They were transferred to the Reception Hospital on Monday, the 23d, where the physician of Riverside Hospital visited them and pronounced all the cases typhus. The Home was at once quarantined, and daily inspection made for additional cases. On the 24th, six more were found there, and one that had been removed to the child's home; on the 25th, one; on the 26th, two, and on the 30th, one. All have been removed to Riverside; none have died or are dangerously sick. It is the opinion of the sanitary superintendent that the disease did not originate in, but was brought to the Home.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Proposals.

PROPOSALS FOR BUILDING PART OF LOCK No. 2, GREAT KANAWHA RIVER, W. VA.

U. S. ENGINEER'S OFFICE, 70 SARATOGA ST., BALTIMORE, MD., *April* 23, 1883.

Proposals for building part of Lock No. 2, of the Great Kanawha River Improvement, *West Virginia*, will be received until noon of May 15, 1883, and opened immediately thereafter.

Blank forms and specifications can be had on application to this office.

WM. P. CRAIGHILL,
Lt.-Col. of Engineers, U. S. A.

PROPOSALS FOR LABOR AND MATERIALS AT TOLEDO, OHIO.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEPARTMENT, WASHINGTON, D. C., *April* 25, 1883.

Sealed proposals will be received at this office until 12 m., on the 16th day of May, 1883, for all the labor and materials, bricks and mortar and setting stone required to complete the Custom House, etc., at *Toledo, Ohio*, in accordance with drawings and specifications, copies of which, and any additional information, may be had on application at this office or the office of the Superintendent.

JAS. G. HILL, *Supervising Architect.*

PROPOSALS FOR FUEL, FORAGE AND STRAW.

DEPOT QUARTERMASTER'S OFFICE, HOUSTON ST., COR. GREENE, NEW YORK CITY, *May* 1, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, on the 31st day of May, 1883, at which time and place they will be opened in presence of bidders, for furnishing and delivering Fuel, Forage and Straw required at *New York City, Willet's Point, N. Y. H.*, and *David's Island, N. Y. H.*, during the fiscal year ending June 30, 1884.

The Government reserves the right to reject any or all proposals, or to accept as may be most advantageous to the Department.

A preference will be given to articles of domestic production, conditions of price and quality being equal, and such preference will be given to articles of American production produced on the Pacific coast to the extent of the consumption required by the public service there.

Blank proposals and printed circulars stating the kind and estimated quantities required at each post, and giving full information as to the manner of bidding, conditions to be observed by bidders, and terms of contract and payment will be furnished on application to this office.

Envelopes containing proposals should be marked:—"Proposals for Fuel, Forage and Straw," and be addressed to the undersigned.

HENRY C. HODGES, *Lt.-Col. and D. Q. M Gen'l, U. S. A.*

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat.) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

—SAMPLE ORDERS SOLICITED.—

NEW DIRECT ACTING

STEAM PUMP.

For Every Imaginable Service.

A large number of these Pumps have been put on every variety of service during the past three years, with the best results.

The Pump is simple in construction, having a smaller number of moving parts than others.

It will work equally well under a light or heavy pressure, at a higher speed, with less noise than any other steam pump, and is suited for every variety of sevice.

All Pumps are tested at the factory under all possible speeds and pressures.

We are prepared at present to furnish all the leading sizes, and are constantly making additions to our patterns.

Send for price lists and discounts to the

HOLLY MANUF'G COMPANY, Lockport, N. Y.,

Or C. G. HILDRETH, Secretary,

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

MEYER, SNIFFEN & CO.'S

No. 1

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER

WATER-CLOSET.

With the Cistern from which it is supplied, a pair of Brackets, the Floor Lever Chain and necessary fittings, except the lead pipe and trap.

The names of some of the parties using them and those having them for sale with full descriptive circulars, will be mailed on application to us.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly three years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADES HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

"IMPERIAL"

Porcelain Wash Tubs,

Manufactured in England exclusively for, and Imported only by

THE J. L. MOTT IRON WORKS,

88 and 90 BEEKMAN STREET, NEW YORK.

"IMPERIAL" WASH TUBS.—No Covers.

The above illustration shows the "Imperial" Porcelain Wash Tubs set up without covers, and with Faucets over top, which is now considered the most approved style of fitting up these Tubs, as it not only gives more room inside, but admits of a much better arrangement of the supply pipes, getting them over the Tubs, instead of behind, where they can be readily got at in case of leak or necessary repairs. A sliding cover can also be made for Tubs put up in above manner if desired, although we should very much prefer them just as shown, *i. e.* showing the beautiful clean porcelain surface.

Note.—*When Tubs are wanted to fit up in above manner, please order without Faucet Holes in back.*

"IMPERIAL" WASH TUBS.—With Covers.

Note.—*When Tubs are wanted to fit up in above manner please order with Faucet Holes in back.*

In calling the attention of Architects, Plumbers and others to these Tubs, it is probably enough to say that they are in material and finish in all respects the same as our "Imperial" Porcelain Bath Tubs, being perfectly modelled, delicate and uniform in color, with a glaze which is simply perfect and unapproached by anything of the kind yet made. They should be seen by all who are in the market for such goods, before specifying or purchasing any other kind.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES ON APPLICATION.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

It has been suggested that a description and sketch of the expired patents of the more important appliances used in plumbing and steam fitting would be of interest to our readers, as indicating the prior state of the art, so far as the records of the United States Patent Office can show it. We begin, therefore, in this issue, the first article on Water Closets, and shall print alternately an article on Water Closets and an article on Steam Heating Apparatus, as our space permits.

THE RAID ON ADULTERATED TEA.

No little excitement was produced in the tea trade last week, when an auction sale of tea was stopped by an injunction issued by Judge Sedgwick on application of Prof. Charles F. Chandler, President of the New York Board of Health, and chairman of the Sanitary Committee of the State Board of Health. John H. Draper & Co., the auctioneers, had advertised to sell at public auction, beginning at noon May 3, "several thousand packages of 'choice teas.'" The sale had progressed until lot 113 was put up, when the messenger from the court with the injunction order reached the salesroom. The teas whose sale was enjoined were some 3,600 packages of "Pingsueys," catalogued as lot 119 and upward.

In the affidavits Professor Chandler declared that the teas were adulterated and unfit for food. He had examined samples of them and discovered that they were all mixed with mineral substances, and were an imitation of another and a better article, and if allowed to be sold they would be distributed among the small dealers, and thereby cause great injury and damage. He found the teas, he further declares, colored, coated and powdered, so as to deceive the public. Dr. E. G. Love, public analyst of the State Board of Health, declared that the teas referred to had been adulterated by the addition of mineral matter, which made them appear better than they really were, and of greater value; that they had been colored and coated with a much inferior and cheaper substance, whereby damage and the poor quality of the teas were concealed, and that the mineral matter rendered the teas unwholesome. Charles G. Boardman and William Macgregor, tea importers and experts, testified to the authenticity of the samples and that they were adulterated.

The health authorities, fortified with these affidavits, acted in accordance with the provisions of Chapter 407 of the Laws of 1881, entitled "An act to prevent the sale of adulterated food," and also under certain sections of the Sanitary Code. One section of the State law referring to teas makes it a misdemeanor to sell them "if colored, or coated, or polished, or powdered, whereby damage is concealed or made to appear better than they really are, or of greater value." Congress at the last session also passed a stringent law against the importation of adulterated teas. But this law did not apply to teas then shipped and it appears that this lot, as well as several still *en route* by sailing vessels, could not be excluded by the United States Inspectors.

Fortunately, however, our readers will remember, we were able to secure the passage of a food adulteration law in this State, which fully meets such cases, and under that, which is presented in our issue of June 15, 1881, our health officials have made this move which, it is to be hoped, will result in compelling the removal from this country of the trash, which has for some time been excluded from England, but which in consequence, an English syndicate of speculators have been shipping to the United States, to commission merchants, who, by means of auction sales, have distributed it throughout the country.

There has been a disposition on the part of certain persons to complain that this movement was a sort of a "snap" judgment action, inspired by trade jealousy, etc., on the part of business rivals; it may therefore be proper to state why the consignees and auctioneers had so little notice. About two o'clock on Wednesday, the sale being advertised to take place the next day at noon, we were informed that this lot of teas were to be sold, and it was explained that under the United States act of March 2, 1883, it could not be prevented, and that fact was regarded as most unfortunate, as it was said that these goods were particularly vile.

It thereupon occurred to us, that if authentic samples could be obtained and submitted to the health authorities at once, the sale might be stopped; the attempt was made, and within two hours the writer had secured the samples, and induced Mr. E. G. Boardman, and Mr. William Macgregor to go with him to Prof. Chandler, who at once decided to hold a conference with his colleagues and Col. Prentice, the attorney of the Board. This was held in the evening, and the action to be taken agreed upon. Meanwhile, Dr. E. G. Love the State analyst, and Dr. Chandler had examined the teas, and were prepared to testify. All hands were early next morning at Board of Health rooms, and by the aid of a large staff of clerks, the attorney of the Board was able to complete the various affidavits and

Digitized by Google

papers a little after twelve. He was then rapidly driven to the court room, and the order was signed, and served before one o'clock. To act with greater promptness would have been a physical impossibility.

Whatever may be the outcome of these proceedings, the reputable tea importers and the tea consumers of the country, are under obligations to Prof. Chandler, who acted in the dual capacity of President of the New York City Board of Health and Chairman of the Sanitary Committee of the State Board, and to Col. W. P. Prentice, the attorney of the Board, for their zeal and promptitude, as well as to Messrs. Boardman and Macgregor, who had the nerve and independence to act as witnesses in the emergency, and so far as the action of the health officials is concerned, the New York *Tribune* aptly says, "A few practical steps of that character will have more effect than volumes of reports on the subject of adulteration."

ON THE TITLES OF SANITARY ARTICLES.

We have for some time intended to publish, for the benefit of those who prepare sanitary exhortations for the daily press, a series of titles and head-lines suited to the kind of matter which will be usually printed beneath them.

Thus far, however, we have been too busy about other things to attend to this, and, in fact, had overlooked it, when we came across one of our pet titles at the head of an article in the New York *Morning Journal*, although slightly curtailed. This title is as follows:

THE SERPENT OF CIVILIZATION.

How its Slimy Coils Sinuate Beneath a City and its Poison Breathes at Every Bedside.

While this is calculated to attract attention, we think that our own title was better. It was as follows:

THE SERPENT OF CIVILIZATION; OR, THE SUCCUBUS OF SLUSH.

How Its Slimy Coils Sinuate and Slidder in the Sewers and Slums.

Now, when you have got a title like that, it makes no difference what the quality of the article is, it is bound to be read, and, therefore, it will sell.

Unfortunately, we have not space just now to give the rest of our titles—most of which require a good deal of room—but we will try to supply the want in the near future.

SANITARY LEGISLATION AND VINEGAR IN MASSACHUSETTS.

We have received a copy of a report made to the House of Representatives of Massachusetts, on the 14th of March last, from its Committee on Public Health, by Horace L. Bowker, presenting the following proposed act:

SECTION I. The mayor of every city and the selectmen of every town of more than two thousand inhabitants, shall annually appoint one or more competent persons to be inspectors of milk, butter, cheese, and other articles of food and drink, who shall be sworn to the faithful discharge of their duties. The selectmen of any other town may, and if the town at any legal meeting so directs, shall appoint such inspectors.

SEC. II. It shall be the duty of the city or town to provide suitable compensation for inspectors so appointed, and to furnish them the necessary facilities for the proper discharge of their duties.

SEC. III. It shall be the duty of such inspectors to make frequent examinations of milk, butter, cheese, or other articles of food or drink sold, or offered for sale, and to take samples of any article suspected to be adulterated or illegal, and make, or cause to be made, *proper examination thereof at the expense of the city or town, not exceeding ten dollars in any case*, unless the consent of the mayor or selectmen to incur greater expense is first obtained. If, upon such examination or analysis, any such article is found to be adulterated or illegal, the inspector shall forthwith cause prosecution to be made of any offending party.

SEC. IV. All fines imposed for any offence prosecuted by such inspectors, together with the expense of the examination or analysis in the case, which shall be added to the fine imposed, shall be paid to the city or town, and the taxable costs of prosecution to the county in which the offence is committed.

SEC. V. *Section seventy-one* of chapter sixty of the Public Statutes, and *section five* of chapter two hundred and sixty-three of the acts of the year eighteen hundred and eighty-two are hereby repealed.

SEC. VI. For the purpose of the appointment and qualification of inspectors, this act shall take effect upon its passage, and shall take full effect on the first day of July next.

This is a very bad law, and highly discreditable to the committee reporting it. The requiring every town of more than two thousand inhabitants to appoint a food inspector, and to provide compensation for him, and the giving such inspector the power to make as many analyses as he pleases at the rate of ten dollars for each case, would create an intolerable burden, and offers a direct premium for useless work.

The last section repealing certain statutes by name, we find, on inquiry, repeals the clause requiring inspection of vinegar, and when we add that the reporter of the bill, Mr. Bowker, is a vinegar manufacturer, it is easy to understand the true inwardness of the bill.

The Committee on Public Health of the House of Representatives of Massachusetts is under the leadership of Mr. Bowker, earning for itself in this and other matters before it an exceedingly unenviable reputation, and no member of that committee will be able to shield himself from the odium in which he will find he is held by the intelligent portion of his constituency when he again appeals for votes.

THE HEALTH ORGANIZATION OF CINCINNATI.

Near the close of its recent session, the Legislature of the State of Ohio passed an act abolishing the Board of Health of Cincinnati, and providing that the Superior Court might appoint a Health Commissioner for the city. It also provided that in case the court failed to make such an appointment, the City Council might create a new health board. The Supreme Court having taken the matter into consideration, has decided not to make any appointment, for the reason that the Health Commissioner is authorized and required to appoint a large number of subordinate officers, nearly two hundred in number, receiving salaries and pay, and that such an appointment would therefore include a large portion of the ordinary government of the city. The court remarks that "that portion of government which we are specially intrusted to uphold is the judiciary, and if courts should be constituted boards for the appointment to political offices, we should not long, especially under one system of elective judiciary, with short terms, have anything that could be properly called a judiciary."

While it is to be regretted, on account of the health interests of the city, that the court felt compelled to take this view, it seems to us that there can be little doubt as to the wisdom of its decision.

The Board of Health of Cincinnati, abolished by the recent law, has been of very bad repute. But if the people of Cincinnati cannot exert influence enough upon their city government to obtain proper appointments in the health organization, they had better suffer enough to induce them to secure that influence at the polls. It is true that the innocent must thus suffer with the guilty, but it is only by bitter experience that the evils connected with our municipal forms of government can be learned and avoided.

And it must be remembered, that those who will appoint and maintain an inefficient and corrupt board of health, will also appoint and maintain inefficient and corrupt officials in other departments.

To attempt to secure efficiency, by giving a portion of the appointing power to the courts is not to reach the root of the evil—the true remedy can only be applied by the people themselves.

We are indebted to Mr. Joseph Parry, Engineer of the Liverpool Water Works, for some data regarding their water supply for 1882, which we elsewhere print, and which is of especial interest just at this time to New Yorkers. It will be seen that the total consumption per capita during 1882 was 23.05 imperial gallons in twenty-four hours.

Of the plumbing fittings tested, notwithstanding the fact that manufacturers knew their goods were to be subjected to a rigid inspection, yet out of 64,195 submitted, 10,753 were rejected; and of articles for corporation use, out of 13,677 offered, 2,148 were rejected. Revenue from fees for testing was £724.1.6.

In view of these figures, what must be the percentage of leaking and worthless fittings used in New York, where dealers know that no testing is to be done?

THE DISPOSAL OF SEWAGE BY SUB-SURFACE IRRIGATION IN SUBURBAN RESIDENCES.

BY EDWARD S. PHILBRICK, C.E.

There are so many places where this system is applicable, and its merits are so great in such places, that a full and detailed description of it may be of interest.

The limits of its application are as follows: Wherever a quarter of an acre of grass land is available for a single family of eight or ten persons, or an acre for an aggregate population of eighty persons, so situated that the surface of the sod is five feet or more below the level of the house drain, where it leaves the house or houses, this system will dispose of all their sewage in a satisfactory manner, summer and winter, with very little attention—for a term of years—generally five to ten years at least before the distributing drains need cleansing, and often for a much longer period.

The cost of the works varies according to local conditions. Hitherto it has been difficult to have the work done in a proper manner without the supervision of a civil engineer to lay it out and look after the essential points of the construction. It is the object of this article to remove this item of cost, by so explaining the process and the proper construction of the apparatus as to enable any intelligent mason to do the work with the help of such tools as he is familiar with. An engineer's level may be convenient where considerable distances are to be traversed by the works; but for supplying single houses, nothing is generally needed more costly than a common mason's level, if correct and tolerably sensitive, with a straight-edge twenty feet long.

If house sewage is allowed to flow directly into a system of porous tiles laid under the surface, the fluid parts escape at every joint, and soak into the soil: but the solid matter which may not have become finely divided, is apt to linger in the pipes, and soon fill them up so that they become practically useless until taken up and cleaned.

In order to avoid this result, it has been found necessary to provide a tank or tight cess-pool in which the solid particles of the sewage may become macerated and finely divided by fermentation before entering the distributing pipes. Moreover, if such a tank be allowed to overflow continuously by a driblet into the porous pipes, they become choked even then. The flow must be made intermittent, and be allowed to take place at intervals with such a rush as to fill the whole system of distributing pipes at once and brush away any slight obstructions which may have been deposited by previous discharges. There are two methods of attaining this result. First, by providing a stop gate in the outlet pipe where it leaves the tank, at or near its bottom, to be opened by hand when the tank is full and

Digitized by Google

closed again when empty. Second, by a syphon arranged to discharge the tank automatically when filled.

Of course, the latter method is far more satisfactory, if reliable, but it is somewhat more costly, and the syphon is *not* always reliable. Field's syphon has been generally used for this purpose, and though it works well with pure water, and also with sewage when the quantity is large, such as might be obtained by a combination of several families in one system, it is found to need occasional attention when on a scale adapted to a single family of ten persons or less. The principle of the Field syphon is explained below. It is well known that no syphon will work unless the longer or descending limb is filled with water. The drainage of an ordinary house is seldom so profuse as to fill a two-inch pipe, after passing through a tank, which must always equalize the flow, and tend to distribute sudden gushes of water over a longer period.

It had long been known that if the lower or discharging end of a syphon is sealed with water, *i. e.*, if made to dip in a cup previously filled, a subsequent slight flow through the syphon would soon expel the air from the whole of its length, and the syphon would begin to act. The reason for this is found in the fact that the water in dribbling through the syphon carries with it a small quantity of air by friction, just as bubbles of air are always dragged under the surface of water in a basin when pouring more water into it from another vessel held a few feet above. The air would thus be gradually expelled by a slight continuous flow of water, because the water in the cup would prevent its return.

If the syphon be thus arranged and left to itself, it would readily discharge the tank soon after it was filled. But the syphon being full of water and both ends dipping in water after the tank is emptied, the next influx of water from the house would raise the level of the water in the tank slightly and the syphon would at once begin to act again till the level was reduced. Thus the tank could never be filled again unless the syphon be first emptied and rendered inert. It is true that a little air would probably enter the syphon from the tank as soon as the level of the water in the tank is reduced to a point as low as the inner end of the syphon, but the instant a bubble of air so enters, it displaces its bulk of water in the syphon and this water drops back into the tank, raising its level slightly and thereby preventing the entrance of any more air, so that the syphon, though partly emptied perhaps, will still contain water enough in its outer limb to set it in action as soon as the level of the water in the tank is raised a few inches, and the tank is thus not allowed to be filled.

Mr. Rogers Field, C. E., of London, invented the following device to overcome this difficulty: He cut a V-shaped notch in the edge of the cup, so that, as soon as the water ceased to flow, after discharging the tank, the cup would lose a little of its water and expose to the air the lower end of the long limb of the syphon. This admitted the air to the syphon, which soon lost all its water as desired, and remained inert till the tank filled up again. Of course the syphon could not be charged and begin its action again till the driblets running through it were sufficient in volume to keep the V-shaped notch filled by the overflow of the cup and the cup also filled for a sufficient length of time to have all the air expelled from the syphon.

Subsequently, Mr. Field applied a small syphon to empty the cup instead of the V-shaped notch. The small syphon became charged by the rush of water through it while the large syphon was in action, and after the latter had stopped its flow on discharging the tank, the small one in its turn discharged the cup and thus emptied the large one.

Now, both these devices, in which Mr. Field's patent consists, though working with tolerable certainty when supplied by pure water, are found to be uncertain with sewage on a small scale, for the reason that the V-shaped notch in the edge of the cup, or the small syphon if that were used, gets choked with particles of solid matter brought along and deposited by the sewage; so that after a week or two the cup would remain full, and the large syphon would then also remain full, or nearly so, and prevent the tank from being filled again by drawing off its water by driblets as fast as it comes from the house.

(To be Continued.)

SEWER CONNECTIONS TO PRIVATE HOUSES.

Mr. William Henderson, a Boston plumber, sends us the following comments and suggestions on the drainage of houses in the Back Bay district of Boston:—

The houses are built in blocks with an alley between them, through which runs a sewer receiving the house drains on either side through the back yards. This sewer discharges into a large main sewer in the cross street running to the Charles river. The house connections to the alley sewer generally have a running trap from 5 to 15 feet from the wall of the house, and a stand pipe (fresh-air inlet) of four inches in diameter, attached to a branch on the drain on the house side of the trap, though in some cases the stand pipe starts from the inside of the man-hole over the trap, a branch from the trap being left open into the man-hole. These stand pipes are placed at various distances from windows, some being fixed to the wall along side a window, and others against the party fence. The soil pipe is carried up through the roof in various ways—such as on a pitched roof in the centre of it, and on a flat roof close to the chimney stack, with which it is carried up when between two higher buildings. The mouth of the soil pipe is clear of all obstructions, as it should be.

The yard in the rear of the house through which the sewer connection is taken, has a mason's cesspool, which

Fig. 1.

in most cases is used for yard drainage alone, but in some cases as grease trap also. The air supply for the furnace is taken from the back yard, and in numerous houses the mouth of the air duct is at the level of the ground, while in some cases, it is extended up 12 feet or more. The yard cesspools are, in many cases, branched into the drain on the *sewer side* of the trap.

The stand pipe in yard or fresh air inlet, as it is often called, owing to position of stand pipe (soil pipe) on roof, when a large discharge of water from baths, or improved closets takes place, acts in the opposite direction, expelling foul air into the yard space, from which, on dull days, or in certain directions of the wind, it does not clear away, but is liable to be taken into the house through the cold air box.

The cesspool in the yard is made of brick, and, being built on made land and by contract, generally does not remain tight long, or, if tight, the water evaporates in long dry spells, thereby allowing a means of escape for gases from the sewer into the yard with the same danger as from the fresh air inlet. Also when used as a grease box, the odors from old grease escape into the yard through the grating.

The sewer in the alley generally has a perforated man-hole cover, through which (owing to the traps on each branch), in certain states of the atmosphere, when water is discharged from houses, sewer gases are forced out into the alley, thereby contaminating the air in the neighborhood.

As an improved plan I would suggest that all houses be connected to drain in back alley-way, as shown in Fig. 1, that is, instead of having a running trap, have a simple rubber or metal valve in a case, with means of getting at it for repairs or examination, as shown in Figure 2.

In the upper part of the valve at the point marked *A*, have a 1¼ inch hole, or any other size to be determined before hand—this hole to allow a certain quantity of air to pass through, when the valve is shut from the sewer to the house side of the valve. Where there is a cesspool in the yard, the outlet of it would be branched into the drain on the sewer side of the valve, and the hole in the valve dispensed with. In place of it make the cover of the grease-box tight by trapping, or by a solid iron cover, and have a hole in the bridge of the grease trap above the water line, and a pipe from the inlet side of the box connected to the house side of the valve (as shown in Fig. 3), so as to cause a circulation of air through the grease-box, in order to carry odors arising from it through the roof.

This would be repeated in every house, and at the end of the main alley drain, where it joins the main sewer, there would be placed a valve or trap, to prevent the entrance of gases from the main sewer. At the other end of the alley where the gutter cesspool is located, place a

Fig. 2.

Fig. 3.

sand-box with a bridge in it, open at the top, so that fresh air could be taken into the alley drain through the grated cover of the sand-box, to supply the small pipes attached to the house drain with air. A stand pipe would be necessary to prevent the closing of this fresh-air inlet in winter, when the grating is covered with snow or ice. The gutter cesspool might have a tilting tank.

The advantages gained by this plan would be the removal of the danger from air stand pipe and grease-box escapes, as well as leaks in man-hole covers in alley ways, and from gutter traps (which are most of the time not sealed), and an introduction of an air supply into the soil pipe to keep up a circulation, which would at the same time remove gases in the alley drains through the stand pipes on the roofs, which should have its mouth above all obstructions, and as far as possible from flues or ventilators.

Objection might be made to ventilating the alley sewer through private house soil pipes; but when we consider the objections, they do not appear so serious. The additional length of drain to ventilate would be from 15 to 25 feet for each house, but it would be the cleanest part of the drain, owing to the larger quantity of water flowing through it from sinks and wash trays, and the combined flow of water running in sufficient volume through the alley drain to keep it clear of filth; whereas, the drain inside of the house which leads to the closets, should they be of the pan kind or hopper, with small supply, will be found to retain a large quantity of filth in little bunches above the entrance of the kitchen sink branch, owing to improper use or insufficient flow of water, which lacks power to carry filth off, while the portion of the drain between the sink branch and the yard grease trap is rendered foul by the adhesion of grease to the sides of the pipe—leaving the remainder of the drain, from the trap to the alley sewer, comparatively clean.

The 1¼ inch air inlet (from the alley sewer—through a hole in the valve, or through the grease-box as above described), while allowing sufficient air to pass in to keep up a constant change of air through the soil pipe, would cause a partial vacuum in the soil pipe, owing to the opening at the top being larger than that below, which would tend to draw air into the soil pipe should there be

Digitized by Google

any slight defect in the pipe. Should a large flow of water come down the soil pipe, and the 1¼-inch hole not be large enough, the valve would open and allow the escape of the compressed air into the main alley drain; and as there will always be enough houses not having any large discharge at the same time, there will always be sufficient suction to carry off all the extra air blown into the sewer by this means, thereby preventing the discharge of impure air through man-hole covers, stand pipes and cesspools, into the back yards, where air for the houses is generally taken from, and discharging it instead at a point where it would have the best chance of being dispersed. The reduction of the inlet to 1¼ inch would insure every house taking its quota of foul air from the alley drain, whereas, were all pipes of full size, those at the upper end of the alley sewer would act as fresh-air inlets when any quantity of water was flowing through the drain, and those at the lower end near the trap would act as outlets.

[We are not sure that we fully understand the problem Mr. Henderson proposes to solve. We therefore invite our Boston readers to express their views on his suggestions We may say though that we do not like the idea of placing obstructions like the valve he proposes in a drain, and the risks from a fresh-air inlet that he refers to are unnecessarily exaggerated, and such as they are need not exist.—ED.]

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.

E. G. LOVE, Ph.D., *Gas Examiner.*

THE LIGHT OF COAL GAS AS A THEATRE ILLUMINANT.

The lighting of the stage by footlights, as generally carried out, consists of a horizontal pipe with numerous vertical jets of gas, fixed about level with the stage floor, and usually, as a safety precaution, covered with a wire gauze guard. Notwithstanding this latter precaution, however, this arrangement of lighting is not only pregnant with dangers, but is highly unsanitary; as the products of combustion of such a large quantity of gas, and liberated at so low a level, soon produces in the theatre an insufferably high temperature, and contaminates the atmosphere, if not with carbon bisulphide and carbon monoxide—at least with carbon dioxide. For stage illumination, an arrangement can be utilized by which these serious defects would be entirely removed. This arrangement, adopted by M. Garnier for lighting the Grand Opera at Paris, is as follows: The principle is the exhaustion of the products of gaseous combustion of the gaslight by means of an artificial draught, produced by a vertical shaft at one side of the stage leading to the outside of the roof, and in which are fixed two or three rings of gas burners. This shaft communicates with a horizontal draught-tube fixed below the footlight burners on the stage; the horizontal gas-supply pipe, however, passes below the draft tube, supporting a series of small vertical branch pipes, which are arched over the draught tube, and terminates in a reversed burner; that is to say, the flames turn downwards from the top to the bottom of the glasses, and pass into the draft tube. By this means the entire products of combustion are drawn away to the outside air, leaving the stage agreeably cool, and, by the addition of an outer tube to the vertical upcast, the entire stage and lower part of the auditorium might be effectually ventilated. This system has been found to give eminently satisfactory results; the illumination is as effective as the old and dangerous plan, and far more economical; and further, the artists and danseuses can approach close up to the footlight burners without the least danger of the ignition of their costumes, however flimsy, as the rough plate which covers the burners is quite cool. Before the row of footlights are ignited, the interior burners in the vertical draught tube or cast up are lighted, to produce a draught sufficiently strong to draw the flames downwards. A system of reflector lighting has also been tried. The burners were fixed below the stage, the light rays being directed upon it by means of powerful reflectors. This plan was not found to give satisfactory results, and was abandoned.

The central sunlight gas burner, generally used for lighting the auditorium, is admirable in many respects. If the outer shaft is made of refractory material, there can be no source of danger, and, if the outlet is properly arranged the heat of the products of combustion might be so utilized. That such an effective exhaustive power could be obtained as would insure a sufficient removal of air for variously attended performances—as, for instance, on a special benefit night, additional jets might be lighted in the outer shaft, in order to produce a greater exhaustive or vacuum power for ventilation—and, certainly, the vacuum system of ventilation is preferable to the plenum. By the addition of the regenerative principle of burning gas to the sunlight, a more intense light would be obtained, with light rays so light and neutral that the most delicate of color harmonies, both of scenery and costume, could be seen and appreciated.

The sunlight should be sufficiently powerful to amply illuminate every portion of the auditorium and side galleries. The under side of the latter would, to some extent, be in shadow, but gas lights along the corridor walls could safely be fixed, and these lights should also be on the regenerative principle, and have tubes for carrying to the air outside the products of combustion, and, seeing that the principle of regeneration (as carried out in the improved lamps) necessitates completely inclosed globes, there would be no probability of smokers, or others, attempting to obtain a light from them—a dangerous practice—but one not uncommon.

The defects of the gas lighting arrangements for producing scenic effects has been the cause of many fires and explosions. One of the principal dangers is the risk of so reducing the pressure of some of the burners, when a sudden and brilliant illumination is required, that the light of these burners is extinguished, and the gas may thus escape from them, and dangerously jeopardize the safety of the theatre. This danger can be greatly reduced by dividing the supply pipes for the stage into a number of sections, each having independent connection with the main service pipes, and each having a special pressure regulator, the pressure of gas to be so arranged that when the maximum pressure is turned on any of the burners it shall still leave a pressure of gas sufficient to keep the other burners alight. Another danger in scenic gas lighting is caused from the fact that when several burners are suddenly turned out the excessive pressure on the other burners tends to produce in the latter a dangerous enlargement of flame. A simple regulator for each small branch pipe would be the best remedy for this danger.

Ordinarily in theatres the taps for regulating the supply of gas are fixed in various parts of the stage; this division often leads to confusion and is dangerous. In the Grand Opera, at Paris, the regulating arrangements are entirely centralized in a position close to the prompter's box, and under the control of the superintendent of lighting. By means of special sliding gas-taps and simultaneous and independent machinery for turning on and shutting off the taps, an instantaneous and perfectly progressive effect of lighting can be obtained with perfect safety.

There should be no naked lights in any part of the theatre; each light should be provided with wire guards.

The service mains should be entirely exposed to view, but in positions where they would not be exposed to oxidizable influences, and all the private gas mains and pipes of the theatre should be regularly tested. A tester made particularly for this purpose is made by a Salford firm.

A grave danger attends the practice of turning off gas lights simultaneously by a single valve at the meter; for supposing that one of the burners has not been extinguished by its own burner, on again turning the gas on to the burners it will of course escape at this open burner. There should be separate connections to the street mains for each division of the theatre—*ergo*, one for the auditorium, another for the corridors, and another for the stage, each with a separate cut-off fixed in a prominent and external position, so that in case of fire any section of the lighting could be cut off. For lighting the gas, a portable electric lighter, Clark's patent, might with advantage be used.

On no consideration should scenery or decorations of an inflammable nature be placed at a nearer distance than 18 inches horizontally, or three feet six inches vertically from any gas light.

The lighting of the scenic burners should be carried out under the direct superintendence of a responsible person, and not be left to a deputy. It will be remembered that the Nice Theatre disaster was caused by the careless lighting of the scenic burners.—B. H. Thwaite, F.C.S., in *Building News.*

[Most of the above methods and suggestions seem to us practicable and worthy of adoption. The principle spoken of as having been adopted at the Paris Grand Opera House for the removal of the products of combustion from the foot lights is applied, we believe to the proscenium lights in the Madison Square Theatre of this city, but we do not know of any case in this city where it has been applied to the foot lights. In the case of the Madison Square Theatre, however, the exhaust draught is produced by a fan or blower. The expediency of using pressure regulators to us seems doubtful. One of the most experienced theatre gas fitters in this city says he has never found them reliable, and that the remedy in the case above described would be worse than the trouble. If the pipes are large enough the danger spoken of would not exist.

In the new Grand Opera House of this city (the lighting of which we hope to describe when the work is nearer completion) there are separate connections to the street for the stage and auditorium, and the supply so arranged that the lights in the latter, though they may be turned low, cannot be put entirely out from the stage.]

ELECTRIC LIGHT NOTES.

The present condition of electric lighting in the city of London is thus determined from the report of the City Commissioners of Sewers. The experimental arc lighting by the Brush and Maxim Weston Companies is still going on upon the terms of the contract entered upon last year. The incandescent lighting by the Edison Company is still going on, the contractors being paid after the same rate as the original cost of gas.

The Hartford Electric Light Co. has submitted to the city authorities a plan to light the entire city, and the proposition, in official form, will be laid before the council at its meeting two weeks hence. According to this plan a saving of $8,000 will be effected and the city better lighted.

The Common Council of New York has given permission to the Western Union Telegraph Company to lay its wires under the streets of the city on the payment of one cent per lineal foot of each street opened and the giving of two wires for the city's use.

The electrical companies of this city have under consideration a plan for laying wires underground, devised by Mr. William Mackintosh, of Providence, R. I. According to his plan, lines can be run into buildings as gas and water is now taken in.

A committee of seven has been appointed in Boston to note such steps as might be taken by the petitioners in regard to a proposed electric railway on the Back bay. A remonstrance against the granting of the petition has been sent to the City Hall.

In Dubuque, Iowa, an organization has been effected under the title of The United States Electric Light and Power Co., of Iowa. Present capital stock, $50,000, with the probability of an increase to $150,000.

A movement is on foot to establish a school of electric engineering at Brattleboro, Vt., in connection with the old Norwich University, which it is proposed to remove to that town from Northfield.

A bill passed the New York Senate last week, authorizing the commissioner of the new capitol to complete arrangements for lighting it with electricity.

Nashville, Tenn., is to decide whether it will pay $43,000 for electric lights or continue to rely upon gas at a reduced rate.

Commissioner Ropes states that there are 2,500 miles of wire and over 5,000 telegraph and telephone poles in Brooklyn.

Meter-ites.

A printed statement recently laid before the Philadelphia Councilmen, shows from figures taken from the report for 1881 of the gas trustees, that the total cubic feet made that year was 2,209,145,000, of which 1,444,190,800 cubic feet were sold to private consumers, 412,641,932 cubic feet were used for public lights, and the remaining 352,312,268 cubic feet charged to leakage, showing the leakage on the aggregate to amount very nearly to the cubic feet used for public lights. The cost of producing the gas was $1,674,301.07. The cost of distributing it was $389,726.99, the leakage being about ten per cent. in the delivery through the gas mains.

In London the rates for lighting the public lamps by gas are as follows: five feet burner, square, for gas, £3, 8*s.*, 1*d.*; for lighting, 15*s.*, 0*d.*; for repairing, 3*s.*, 0*d.*; total, £4, 6*s.*, 1*d.* ($20.80); five feet burner, circular, for gas, $3, 8*s.*, 1*d.*; for lighting, 15*s.*, 0*d.*; for repairing, 7*s.*, 3*d.*; total, £4, 10*s.*, 4*d.* ($21.84). The number of lighting hours per annum, 4,300. Price of gas, 3*s.*, 2*d.* per 1,000 cubic feet. The difference in the charge between the square lamps and the circular is owing to the additional expense incurred in cleaning and maintaining the circular-shaped lanterns.

In addition to the tests of the various gaslight burners and lamps, now being exhibited at the Crystal Palace, Eng., the Committee of the Gas Institute have arranged for the heating and cooking apparatus to be thoroughly tested and reported upon by the Testing Engineer of this Institution (Mr. D. Kinnear Clark, M. Inst., C.E.), associated with Mr. W. J. Dibdin, the Chemist to the Metropolitan Board of Works, and Professor W. Foster, M.A., of the Chemical Laboratory, Middlesex Hospital.

Mr. Mulholland's bill, providing that the price charged for gas in New York and Brooklyn shall not exceed one dollar and fifty cents per thousand cubic feet, was adversely reported in the Senate.

WATER CLOSETS.

By F. B. Brock, Washington, D. C.

A CHRONOLOGICAL ABSTRACT OF ALL EXPIRED AMERICAN WATER CLOSET PATENTS WHICH ARE PUBLIC PROPERTY.

This series of articles, besides being of general interest to our readers, is of special interest to manufacturers, to patentees, and to owners of existing water closet patents. The manufacturer may ascertain what kind of closet he can make without infringing any patent, and the patentees and owners of patents may see more clearly what and how much they have secured under their grants. To original inventors contemplating protection for their devices, these articles will have a special value. In case, also, a manufacturer be called upon to desist from the manufacture of a certain closet as being an infringement of some existing patent, he can, by referring to these articles, ascertain whether such is the fact, in so far as American expired patents are concerned.

The first patent ever issued by the United States Patent Office for a water closet was granted November 19, 1833, to Edward Robinson of New York, and the second patent for the same invention was issued March 11, 1835, to James Stone of New York. Both the specifications of these patents were destroyed by the fire of 1836.

January 13, 1847, James Ingram and James Stuart of New York obtained a patent for a water closet. *a* (Fig. 1) represents the trunk or body, having its top cast with a dip flange *c*, surrounding the hole for the reception of the basin *d*. This basin is made of earthenware, and simply set in the dip flange. The pan *e* is jointed to the underside of the cover of the trunk and so located that when the pan is thrown up and filled with water from the water-pipe *f*, the lower edge of the basin and the dip flange surrounding it project into the water, and thus effectually prevent the escape of gases. A second pivoted pan *i* is located at the juncture of the bottom of the body *a*, and the waste-pipe *g*. It is provided with an operating lever-mechanism, and is so placed, that, when the pan is horizontal and filled with water, the nozzle dips into the water and thus prevents the escape of gases from below that point. The axle to which the upper pan is attached, is provided with a handle *k*, and it is also provided with an arm *l*, connected by means of a pivoted rod *m*, with a similar arm *n* on the axle of the second pan. By this arrangement the upper pan is closed while the lower one is open, and *vice versa*, and by means of it the water discharged from the upper pan as it is opened is caught by the lower as it is being closed, thus cutting off connection with the waste pipe.

Ingram and Stuart's Closet.

November 13, 1849, Charles C. Bier, also of New York, received protection from the U. S. Patent Office for a water closet. The nature of Bier's construction consisted in the arrangement of a pivoted pan within the lower basin adapted to be filled with water when not in use and emptied when used; and this he accomplished by a system of self-operating levers and pistons arranged underneath the foot and seat boards of the closet.

Figure 1 represents a perspective view of the device, and Figure 2, a longitudinal section. *A* is the frame work, and *B* the foot-board pivoted to the front rail of the frame A^1. Underneath this foot-board is arranged the induction cylinder *C*, connecting at *D* with the water-main at D^2 with a pipe *E* communicating with the closet reservoir E^2. The plunger piston *F* has a ground tight seat in the cylinder above orifice *D* and below orifice D^2, so as to operate as a cut-off to both. The force of the water seats the plunger when the end of lever *G* under the foot-board has been released. Attached to lever *G* is another lever *H*, which connects with one end of the tilting lever *I* of the pan *M*. A third lever *J* is attached to the other end of lever *I*, and to a weighted lever *K*. This lever *K* is operated by the seat board *L*, for the purpose of throwing partially back the pan, and also for forcing down the plunger *F* to open communication from the water main to the reservoir E^2. *N* is a second cylinder opening into the reservoir. It has a side orifice *P*, having a pipe P^2 entering the back of the upper basin for discharging water from the reservoir. The plunger *S* of cylinder *N* has attached to it a series of levers S^1, S^2, S^3, and weighted lever *T*, the latter extending across the closet and operated by the seat board for the purpose of cutting off the water from the reservoir to the upper basin O^2 while the closet is in use. Under this basin is a second basin or trap *V*.

Ingram and Stuart's Closet.

Bier's Closet.

Bier's Closet.

William S. Carr, of New York, December 21, 1852, invented a closet operated by the weight of a person to let on water from the main into an air vessel. When the closet is relieved of this weight the supply of water is adapted to be shut off, and the water in the air vessel by its pressure and hydrostatic column operates on a plunger and empties the pan, and at the same time a supply of water cleanses the basin.

Figure 1 is a plan with the seat removed, and Figure 2, a sectional elevation of the closet.

The weight of a person on seat *d* causes it to descend slightly within the guides *c*, forcing down the rod *K* and plug 13, which, pressing on the elastic packing 12, bends it downward and carries with it the head 11, which forces the rod 4, and valves 5 and 7 downward, closing the lower opening by the seat 8, and opening the valve 5. This allows the water to pass into cylinder 1 and through the pipe *h* to the reservoir *B*. If the valves be kept open in this position a sufficient length of time, the pressure in the reservoir due to the compression of air becomes equal to the pressure in the pipe *e*. When the weight is removed from the seat, the spring 10 lifts all the parts directly above it, bringing the parts into the position seen in Figure 2. The water now rushes back from the compression of the air in the reservoir, passing the seat 8 in a regulated amount, and by the pipe *c* enters the cylinder *m*, and by the pipe *o* washes out the pan, the water continuing to run until it finds its level in the pipes *n* and *o*. As the flow of water is not sufficient to keep the plunger 18 above the pipe *o*, for more than probably half the time the water flows, the weight *G* carries the parts down into the position shown by the dotted lines, bringing the pan *r* up to and around the lower end of the basin *D*, catching sufficient water as it passes into the pan to prevent the egress of gases.

Frederick H. Bartholomew, of New York, received letters patent of the United States, February 14, 1854. This patent also has an automatically operating water supply and cut-off. A weight upon the seat *b* presses down through rod *d* the valve *G* on to its seat, and opens valve *F* having communication between the supply pipe and the water chamber *g* through pipe *f*. This chamber or reservoir *g* is an air-tight vessel, and the water entering, compresses the air therein. No water is discharged into the basin while in use. When not in use the spring *H* throws the valve up to its seat, shutting off the supply, and at the same time opening the discharge valve *G*. The water then passes from the reservoir by pipe *f*, past valve *G* into pipe *h*, and flushes the basin.

The inventor says the valve may be operated by being placed under a step, or so attached to the seat lid or door of the closet, that the *raising* of the lid or the opening and closing of the door will operate it. Figure 3 shows a modification of three-way valve. It is thought its operation will be apparent without special description. In it the water enters from below, reversing the arrangement shown by Figure 1. In Figure 1 the valve *F* is kept closed against the head of water, by the spring *H*, in Figure 3, the pressure of the water, combined with the spring, serves to keep the valve normally closed. The rod *d* and valve stem *E* have a thimble or socket *K*, *I*, respectively, which bear against an interposed flexible diaphragm *D*.

Daniel Ryan and John Flanagan, of New York, patented on March 7, 1854, a water closet, of which the following is a description:

Digitized by Google

Figure 1 is a side elevation, and Figure 2 a vertical sectional view. Figure 3 is a plan view.

A is the trunk, and *B* the bowl, *D* is an exit pipe, and *E* the base which supports the apparatus. *F* is a sliding tube working within the trunk *A*. It is provided with two openings *a* and *b*. The opening *a* when the tube is elevated is opposite the pipe *C* at the lower end of the bowl-seat, and the opening *b* is above the exit pipe. *G* is a lever by which the tube *F* is raised, and *H* is a spiral spring which depresses the tube when the lever *G* is relieved from the hand or foot. When the closet is used, and the lever

Fig: 1

Fig: 2.

Fig. 3

RYAN AND FLANAGAN'S CLOSET.

G depressed, the sliding tube *F* rises. In so rising it operates the cock *V* in the supply pipe *K* allowing water to pass into the annular compartment *I*. When the closet is not in use, the spring *H* depresses the tube and the water supply is cut off. The pipe *F* empties itself as the opening *b* comes opposite the pipe *D*. The opening *a* is then below the pipe *C*, acting as a cut-off between the bowl and exit. The annular space *I* has an upper compartment *d*, which is filled with water when the bowl is flushed, but which only empties itself gradually, and after the sliding tube has cut off the opening through *C*. Thus water accumulates at this opening to form a water-trap.

[TO BE CONTINUED.]

SCHOOL BUILDINGS OF NEW YORK STATE.

Many of the schools of our State are in a condition to call for particular attention in matters of ventilation, overcrowding, health and even moral requirements, and while the Board of Health find much improvement in these particulars, the following notes from their circular 43*a* will show the necessity for the continual vigilance of its officers.

The report of inspection by committee, who were ably assisted by Dr. Lincoln, states in circular 43*a*: "that although greater attention has been paid in new structures to sanitary laws, yet but one in fifteen of common school-houses are ventilated, and those chiefly by opening windows.

"Over-crowding is a prevailing fault, and a disgusting, degrading neglect of sanitary cleanliness found in school buildings, especially in privies and proper separation there of the sexes; such neglect should be prevented by local sanitary authority which public health and moral and bodily welfare of the children demand.

"Drinking water (except where fortunate in having a public pump near the school), washing apparatus, pegs for wet clothing, all are found wanting.

"Even the school recess is not allowed, and its probable necessity for health ignored; physical exercise, especially gymnastics for little ones, not being appreciated by those in authority.

"Desk arrangements may cause permanent injury to eyesight, and should be regulated by medical advice.

"Vaccination of school children has met with favor by parents, and it seems eminently desirable and practicable to secure compliance with statutes as administered by State Board of Health; the adoption of its sanitary laws being an obvious necessity to health and life in schools."

HARRISBURG HOSPITAL.

Mr. L. M. Simon, the architect, sends us the following particulars in regard to the Harrisburg, Pa., hospital:

The addition now building is 40 feet front by 60 feet deep, three stories high. First story 15 feet; second story 12 feet; third story 11 feet and 6 inches in the clear. At the present only two stories will be finished. The first story has rooms for the managers, physicians, surgeons, operating and drugs, and elevators. The corridors and stair halls are unusually wide and well lighted. The second floor has parlors and reading rooms, and five rooms for patients.

All rooms and halls on the first floor, and nearly all rooms on the second and third floors, have large fire-places for *bottom ventilation*, and flues, adjoining and warmed by the fire of the fire-places, and the gas flues of the furnaces for top ventilation. It is intended to warm the building by two hot air furnaces.

There are no water closets, baths or stationary wash stands in the building proper (excepting a slop sink and wash basin in the operating room, and a wash stand in the drug room). These are located in a building connecting the new portion with the old. This part has windows on opposite sides.

All sewer pipes are in the yard. None are in or under the cellar. The sewer has a trap just inside the pavement line, with fresh air inlet on house side.

A society of citizens of Mount Vernon has been formed for improving the appearance of the village.

Correspondence.

CHECKING WASTE.

NEW YORK, *May* 2, 1883.

To the Editor of THE SANITARY ENGINEER:

Shortly after the publication of the conclusive article on "New York's Water Supply," which appeared in your issue of the 5th inst., the writer began a communication in response to your wish to have those of your readers who have had experience in dealing with the question submit such views in relation to the best method of insuring a permanent and sufficient supply of water in New York City, as seemed to them most feasible. Unlooked for causes prevented its earlier completion. Of course, no single ordinary newspaper article, confined within reasonable limits, can adequately cover all the points referred to in your article of the 5th inst.; hence it will be necessary to allude to only some of them, and that briefly. In order to put myself properly on record at the start, it is, perhaps, better to acknowledge that your first method, "the placing of a meter in every house, assuming no control over plumbing, but relying on the consumer's desire to economize in water tax to secure a stoppage of waste, to cause the reconstruction of defective plumbing and the removal of wasteful fixtures," is the plan, and the only one, in the writer's opinion, that can satisfactorily solve the problem of water supply in New York City, as well as in other large centres of population. This opinion is founded not only upon a personal study and close observation of the question in all its details and by a somewhat lengthy and instructive experience of it, but is fortified by the almost unanimous verdict of all the best engineering talent, not only in this country, but in Europe. There are cities whose public spirited officials have tried all known remedies in their attempts at a solution of this seriously important question, and who have in the end adopted, and continue to maintain the meter system with such successful results that their only regret is that the advantages of it were not earlier known, so that it might have saved the authorities much anxiety, and the public treasury an abundance of the taxpayers' money. Having taken the position specified, I shall endeavor to answer the several questions based upon your proposition in their order.

1. As to the danger that a metered service would tend to prevent any considerable number of people from bathing, etc., the allowance of any ample quantity of water *per capita* for all legitimate uses, for which a certain specified rate would be charged, whether that quantity is used or not, but whatever quantity would be used in addition thereto to be paid for by measurement, would obviate any trouble that might arise, from a sanitary point of view, consequent upon a too stringent economy in its use. As to the action of the usual flushing facilities for closets and urinals, it is a question whether they are in any degree of great value. If it were possible to educate the community to understand that the ordinary dribbling of a closet faucet is practically of no value in cleansing drains or waste pipes, but that the occasional sudden discharge of a pailful or two of water will do the work most effectually, a great point will be gained in preventing a considerable percentage of waste. With a metered service and properly arranged fixtures, this serious item of water waste would necessarily be considerably reduced.

2. Your third query assumes a state of affairs that does not, to any extent, exist. I think it is the rule for the owners of houses in New York City to pay the water tax, as they are held responsible for it by the water department. That being the case, it would certainly be to their interest, in the event of a measured service being applied, to keep their fittings in order and protected from frost; and, necessarily, would make the supervision of plumbing in buildings largely superfluous.

3. No measures are necessary to ascertain what waste is taking place under ground until we have first put an end to the waste that we know is taking place above ground. That done, we can afford, I think, to let the underground waste go. It is an insignificant portion of the great evil which we can permit to continue—at least, until the much greater one is effectually abated. It is generally acknowledged by water works superintendents and engineers that the waste caused by leaky and imperfect fittings is the main cause of the immense consumption of water in all large communities. Mr. William F. Davis, Water Registrar of the City of Boston, whose long official experience and complete knowledge of the water supply question entitles him to be ranked as a high authority, says that according to figures recently made by him, the percentage of waste in that city equals forty per cent., and one of the principal reasons for this waste he states to be the immense number of leaky fixtures. Of this he gives a very striking illustration. About three years ago application was made for a meter to be put in at the Simmons Building, one of the best built, and supposed to be the best plumbed building in Boston. After the meter had been attached, it was found that at night, without a single occupant in the building, except, perhaps, the janitor and his family, the consumption of water was 13,000 gallons, against 9,000 gallons in the daytime, when the building was occupied by the tenants. An examination was made to determine the cause of this enormous waste, and it was found that of the thirty-six tanks with ball-cock fixtures, to operate the flow of water, sixteen were out of order, and the increased pressure in the mains at night, as compared with the daytime, explained the reason. The tanks filled, but the fixtures being out of order the ball did not rise and close the faucet, so that there was a steady flow running off into the waste pipes from these tanks during at least twelve of the twenty-four hours. An extended and searching examination of the waste caused by leaky closet fixtures in the city of Boston was made by the same official, and the figures are somewhat appalling. They are too long for reproduction here. Enough to say, that it was proven there was a waste from this cause alone of nearly 4,500,000 gallons in every twenty-four hours. With a metered service, who doubts but that all this great defect would have been remedied and removed so that it would never recur?

4. The probable expense of placing meters in the houses of New York can probably be arrived at as follows: The number of taps in the city, according to the official figures, is 85,000, of which about 7,000 are now metered, leaving a balance of 78,000 not metered. Of this 78,000 it would not be advisable to meter one-fourth, or they would not be metered, probably, if full power and discretion were given to the Water Department, so that there would remain to meter say 58,500 taps. It would cost for meter, setting, etc., not more than an average of $30, for each tap, or $1,755,000, and they could be furnished and set, it is believed, in two years—certainly in three.

5. If the city should purchase the meters and issue bonds to pay for the same, they would unquestionably be sold at par, paying from three to four per cent. interest—say three and one-half per cent. or $61,425 per annum. The cost of repairs for ten years would not exceed an average of one dollar each—in view of the vast improvement made in recent years in the construction of meters—or five per cent. on the cost of the meters, which on 65,500 meters would amount to $65,500, estimating the average cost of each meter at $20.

New York City consumes a daily average of 95,000,000 gallons of water, 10,000,000 gallons of which are used for public and fire extinguishing purposes. The present annual revenue amounts to $1,640,000, more than one-fifth of which is received for water sold by meter measurement. Assuming that the 85,000,000 gallons consumed by private parties was delivered through meters at a cost of thirteen and one-third cents per thousand gallons, it would give us a yearly revenue of $4,136,563.25, or an excess over the present amount of $2,496,563.25. But the application of meters would reduce the consumption of water to say two-thirds the quantity now used, or, about, in round numbers, 60,000,000 gallons; this quantity, at the same rate per thousand gallons, would bring in a yearly revenue of $2,919,927, or an excess over the present amount of $1,279,927.

6. The clerical staff of the Department would not have to be increased; in fact, it is a question if, in the event of a general application of the meter system, it could not be reduced. There would be less work to perform, the bills calling for but one item.

7. For the city of New York it would not require more than twenty inspectors to take the readings of the meters quarterly, provided they would do half as much as those do who are employed by the gas companies.

When the city of Providence had 4,500 meters in use there was employed by the Department then only two men, who were regularly engaged at that work, one of whom, in addition, acted as collector and examiner of fittings, both of whom would be required if there were no meters in use. During certain seasons of the year a clerk or two from the office is detailed for the work, but it is a merely temporary employment, lasting for a few weeks only. The city of Worcester, with about 4,000 meters in use, had four meter inspectors, but they were not employed especially for that purpose. These men read the meters and examined them once a month. This takes about two weeks. The balance of the time they are employed at other work. It seems that if employed all the time as meter inspectors the services of two would be sufficient. In view of these facts, it is within reason to suppose that twenty men would be enough of a force of meter inspectors for the 65,500 meters placed in New York.

8. The Providence plan, by which a charge is made for every tap and fixture unless the house owner elects to accept and pay for a meter, it being understood that a specified tax shall be paid whether water is used or not, but only the excess of this specified amount to be charged for by measurement, is an admirable one, and cannot very well, in my opinion, be improved upon. If the meter system is to be applied in New York, that would be as good a plan to adopt as any. To my mind, the house owner should be made to purchase the meter, and it should be considered as much a part of the water fittings of a house as a hydrant or any other fixture. Under a law compelling its purchase, the whole question would be greatly simplified, and public officials would be relieved from the charge of originating and fostering a huge job for the purchase of meters with public funds, with which they would assuredly be charged by that irrepressible class of indignant taxpayers who can never be made to understand or believe that public officials are ever induced to advocate salutary measures for the good of the commonwealth without having concealed somewhere a scheme to fleece the public treasury.

In conclusion, let me say that it is a matter of easy demonstration to show that the general application of meters in New York would greatly increase the water revenue, and correspondingly decrease the consumption of water, by putting an end to waste. There is no reason why the experience of Providence and other cities should not be repeated in New York. The same conditions exist and the same remedies are available. Human nature is pretty much the same everywhere. The inhabitants of Providence are similar in habits and customs to those of New York, and what has proved good and beneficial there would have a like effect in the metropolis. It appears somewhat incongruous, however, that we should go to the small New England cities for proper instruction upon this great question of water supply, but so it is nevertheless. Boston has gone through all the varied experiences of New York, and has settled down at last to a firm belief in the efficiency of the meter system. Our transpontive neighbor, the City of Churches, is entering upon a grand scheme to expend half a million dollars to increase the water supply, without any real necessity for doing so. One half the sum invested in meters would settle the question there for an indefinite time. When she gets her additional five or ten million gallons, the annual water famine will come along as usual, with touching regularity. And so it will be until her authorities fall into line with the advanced thought of the day upon the question, and advocate the application of the meter system. And so it must come in New York, sooner or later. When it does, those who have prophesied the result will have abundant satisfaction in knowing that they did not predict in vain.

C. E.

THE SEWERAGE OF BINGHAMTON.

NEW YORK, *May* 4, 1883.

To the Editor of THE SANITARY ENGINEER:

The letter of Col. Waring, in your last issue, in reply to mine in a former one, hardly calls for an answer. He simply reiterates the points of his former letter without giving any additional support.

The valuable article by Prof. Baumeister, which is contained in your last number, gives a further and most lucid justification of the principles I have advocated.

The conclusions of his research are almost identical with those contained in my report to the National Board of Health made several years ago. The same views are held in the main by Mr. Rawlinson and Mr. Lindley, who are quoted by Col. Waring, as though they indorsed his patents. Both of these gentlemen, in conversation with me, in their writings or correspondence, have asserted that the admission of more or less roof water is beneficial to the sewers.

Mr. Rawlinson states his views in a letter to THE SANITARY ENGINEER, a year ago, from which it seems very

Digitized by Google

doubtful that he would ever recommend the patented combination. Mr. Lindley has recently designed a separate system for a portion of Elberfeld, Germany, yet he also has not advocated the Memphis patent.

How Col. Waring can call the separate system, as outlined and still indorsed by Mr. Rawlinson and others, a "little better than a makeshift," while he considers his own somewhat a perfect one, is very curious, because the difference between his and the above not patented system may be insignificant, and lies in the absolute exclusion of roof water in his, and its admission in the other, *however small in quantity*, at the heads of sewers, and not even increasing the cost as much as the royalty, and curiously also, because this very admission rather than the exclusion of roof water has always been and still is considered beneficial and desirable by municipal engineers generally, and also by property owners, and is not objected to by sanitarians.

Yours respectfully,

RUDOLPH HERING.

RESERVOIRS AND HEALTH.

MONROE, N. Y., *April* 27, 1883.

To the Editor of THE SANITARY ENGINEER:

If you have occasion to discuss the "Ramapo Project," in a future issue, much interest would be felt in this district in reading your views of the effect on health and value of real estate in localities where many acres of vegetation will be covered with water. Would the fact that the water was constantly flowing from these artificial reservoirs overcome the danger of malaria?

Yours truly, C. T. KNIGHT.

[The question as to what effect the presence of reservoirs of fresh water, in which the water is constantly being changed by drawing off a daily supply, will have upon the healthfulness of the vicinity, is one of much interest, but also one which depends so much upon the circumstances connected with each particular case that it hardly admits of a general answer.

We believe that in the great majority of cases a reservoir can be so constructed as to involve no special danger from malaria. The covering of acres of vegetation with water, to which our correspondent refers, is never necessary, and should never be allowed, for the decay of this vegetation will injure the water, and those who receive it will suffer as well as the inhabitants of the neighborhood.

Very little is known as yet with regard to the transportation of the cause of malaria by means of the water supply, but certainly competent engineers would bear this possibility in mind, and in constructing reservoirs be careful to avoid producing anything like a swamp, on account of those who are to use the water, as well as those who live in the vicinity. It is especially desirable to remove, as completely as possible, all organic matter from the surface which is to be permanently covered with water, and in cases where, to save cost, this has not been done, the results have not been satisfactory.

The precise relations of small collections of water, such as mill ponds, etc., to malaria, are at present by no means agreed upon; and as manufacturing and commercial, as well as sanitary interests are involved in these cases, controversies have arisen in which there has been much clashing of so-called expert testimony. It is a matter which demands scientific investigation, and as this investigation will require several years and the employment of specially skilled chemists, microscopists, etc., and as, moreover, the results of such an investigation will be of the highest value throughout the country, it seems to us that the United States Government should bear the expense, and that the sooner provision is made by Congress for this work the better.]

PLUMBERS' PROFITS.

PHILADELPHIA, *April* 24, 1883.

To the Editor of THE SANITARY ENGINEER:

The letter of Mr. Jno. Worthington in your paper, April 12, embraces more common sense to square inch than all the other answers and replies on the question of "Plumbers' Profits." And if any man in the plumbing and gas fitting business would keep a copy of it in his shop and honestly keep up to its teaching, he would be better off, not only in the opinion of his customers, but in his own; and it would gradually but surely work up every man to its sensible views.

These few lines of his are worth more than all the columns written about material men, and will *compel* them to look to those in the business for their custom.

J. M. WILLIAMS.

LEAD BURNING.

JACKSON, MICH., *April* 29, 1883.

To the Editor of THE SANITARY ENGINEER:

At your request, I sent, as I told you, a few hurried sketches with description of lead burning machines, not for the information of practical burners, but as an item of interest for your readers; but what I said and what I described were correct, as I will here show for the information of good lead burners, as Mr. Charles E. Field would style himself.

If he had been in the habit of doing large work he would not talk of round patches. For instance, if a patch were to be eight feet square, should it be cut round? He very truly says that all the patches on Fig. 5 can be burned on the outside; and right here I wish to ask him how he would proceed with patch *F*, Fig. 5, to dispense with strip and leave sheet uncut, assuming that it is for an 18-inch connection, which is small. This would give a straight cut at bottom of 24 inches. If he is an expert he will answer this without asking any further questions. It will not take him more than a minute to show how he would fit the patch, but it must have a 24-inch horizontal seam at bottom, without using strip or cutting through. He does not seem to understand what I mean "by in use" in reference to this very patch that he is showing so much about by his drawing, or, as he styles it, the better plan.

Now, for those who do not know the term as used by me of making connections with chambers while in use: chambers are large rooms lined with lead for the condensation of sulphuric acid. They are often in sets and have connections from one to another. These connections are made so that they can be changed, as, if one chamber should be laid off for repairs, the connections are lifted out and caps dropped on, thus disconnecting the chamber. When the repairs are done the caps are lifted and the connection put on. My reference to patch *F* is in these words: "*F* is of a kind I have employed in making large connections with chambers while in use." This means while the chambers are full of gas and the inside of the sheet wet with the condensation going on within. Now, the least part of this gas escaping will so tarnish the lead as to make it very difficult to burn. Then if I were to use his better plan I would be smothered in a few minutes, and I spoke of this patch as being something I had used. Now, I challenge Mr. Field to make a drawing that will represent this very connection, as used with the patch as I have said, and which he has seen fit to criticize. His Fig. 2 is the same as *A*, *B*, *C*, *D* and *E* of my description. Patches may be of any shape.

Another thing is the burning of the pipe by cutting through. Supposing the pipe to be of 12-inch diameter, its lower half sunk in brickwork and immovable, how then will he do as he says? All I have shown are practicable and much used in large works.

Now about the oxygen: If he wants to know about it, he can learn by purchasing one of my machines and putting up the money for it, and I will let him have it on trial. If it does not do all that is claimed for it I will forfeit the machine. If it is what I claim, he to acknowledge it in THE SANITARY ENGINEER. If he is anxious to see the work done by this machine he can get samples by express. With this mail I send you a small sample of burning an ordinary seam done by this machine, and if you show it to a burner he can decide whether this work is as good work as by the oxy-hydrogen machine; and, as I said before, I get my oxygen at the point of combustion and not from a hydrogen generator, as he says. He had better lay that old machine on the shelf, and get something more modern, and fully as good, with a great deal less care.

Hoping I have not taken too much of your valuable space, but wishing to hold up my end,

I am yours respectfully,

THOS. H. WALKER.

QUESTIONS IN THE PLUMBING COURSE OF THE NEW YORK TRADE SCHOOLS.

A few weeks since we published the questions which are given to the pupils of the New York Trade Schools on boilers. We now print those on the subject of trapping and ventilating soil-pipes.

1. What is the object of a trap?
2. How is this effected?
3. Is this an effectual remedy?
4. Will the water in a trap absorb gas and emit it again?
5. How is this difficulty overcome?
6. Where should the open end of a pipe be situated, and how is the pipe usually terminated?
7. What is the object of the trap required by the Board of Health where the soil pipe enters the house?
8. Is there any other theory on this point?
9. What is the theory of the Board of Health in regard to this trap?
10. What causes a pressure from the sewers on the main trap?
11. Can the difference in temperature between the air in a sewer and in a soil pipe unseal a trap?
12. Will open fires cause a suction on soil pipes, and why?
13. What is the best form of a trap at the outlet of a soil pipe, and of what material should it be?
14. Why is the momentum of a column of water not likely to carry it through a trap and leave the trap unsealed?
15. What is the effect of a column of water passing through a pipe and completely filling it?
16. Why will a vacuum suck the water out of traps?
17. What is the pressure of the atmosphere on a vacuum?
18. How is this suction prevented?
19. Can a vacuum be created in a pipe when it is only partly filled with water?
20. The Board of Health requires a 4-inch pipe to extend from the outer air to a point just inside the trap by the exterior wall; what is the object of that pipe?
21. Why does the air enter by this pipe and pass out at the top of the soil pipe?
22. Why does warm air ascend?
23. Can a rush of water through the soil pipe affect this ventilating pipe, and should any precaution be taken in regard to it?
24. Is it a good plan to run a soil pipe in a flue, and why not?
25. How deep should the water-seal be in a running trap?
26. Is there any objection to a deep trap?
27. What is an air lock?
28. How does it affect the passage of water?

TRAP AND AIR INLET.

Mr. Francis Botting, of London, sends us the following sketch of a drain trap designed by him, and his manner of setting it. The oblong opening is to facilitate the removal of obstructions. The traps are made of iron.

REGISTRATION OF PLUMBERS.

The following are the rules for the registration of plumbers in San Francisco:

1. A Board of Examiners shall be appointed by the Board of Health, to serve without pay. Shall examine all applicants for registration, as master or journeymen plumbers; and said Board shall consist of the official Inspector of Plumbing, two master plumbers, and two journeymen plumbers; and on the recommendation of said Board certificates of registration only shall be issued.

2. All persons who apply for such registration as master plumbers, shall undergo a theoretical examination as to their ability to have charge of and direct the plumbing and drainage of buildings, and all persons registering as master plumbers, who can give proof that they are practical plumbers, shall, upon passing the same examination as is prescribed for journeymen plumbers, receive a certificate as theoretical and practical master plumbers, and said certificate will enable all master plumbers to employ under their directions, and for whom they are personally responsible, such persons as apprentices, or others employed by them, who, either through lack of skill, of age, or experience, are unable to register as journeyman plumbers; provided, that no person over twenty-five years of age shall be allowed the benefits of this clause.

Digitized by Google

3. Journeymen plumbers applying for registration shall undergo an examination as to the practical part of the trade, and state, on a form provided for that purpose, their age, place of residence, where they learned their trade, and with whom, and where now employed; and upon the recommendation of the Board of Examiners, shall be granted a certificate of registration.

4. The Board of Examiners will hold meetings weekly, or whenever notified by the official Inspector of Plumbing, who is hereby made Chairman of said Board.

Food and Drugs.

THE TEA INJUNCTION.

Counsel for Messrs. Purden & Wiggins, the consignees of a portion of the Pingsuey teas, the sale of which was enjoined last week, appeared in court on Monday, the 8th, and asked for two weeks more time to prepare their case. No opposition was made by the attorney for the Health Board, but Judge O'Gorman allowed them one week.

At the auction sale of teas, advertised for this week, we notice that no Pingsueys are offered. Significant fact.

The first lot of tea rejected by the Government Inspector, under the new law forbidding the importation of adulterated or spurious tea, arrived recently from England. It was a lot of 50 boxes of "scented caper." This kind of tea is of the same shape as gunpowder, but unlike it in color, being black, and is scented with "chulan" flowers. Upon examination by a chemist, this particular lot of tea was found to be coated with lead. The object in so covering it is to give the tea a dark, glossy appearance. It was a question whether there was any genuine tea leaf in the lot rejected. It was certain, however, that it was unfit for consumption. We placed a grain of this "scented caper" under a microsope and it looked like a lump of lead.

The Japanese use gypsum, soapstone and a blue coloring matter in manipulating tea. The Chinese use the same articles to color Pingsueys, Tienkis, Fychows and Taipings. Nankin Moyune teas have very little or no coloring matter on them, while Oolong and Congous are not artificially colored. It is claimed that basket-fired Japan, the leaf of which is black, is also free from artificial coloring matter, but of late it has been found that by the use of plumbago a very black, glossy appearance is given to the leaf, which makes it sell at a higher price, as the color pleases the eye of the buyer. Some claim that common Ankoi Oolongs, which are very poor drinking teas, should be excluded, although they are not colored nor always mixed with foreign matter. It is a common opinion that earthy Congous should be excluded. The greatest point in dispute is that covering Pingsuey greens. Some claim that, as the better grades of Pingsueys are not injurious to health, they should be admitted, but that the common kinds should be rejected. No two experts seem to agree as to the dividing line or where the good leaves off and the bad begins.—*The American Grocer.*

VINEGAR IN BOSTON.

Mr. B. F. Davenport, the inspector of vinegar for the city of Boston, has made his report for the year ending March 31, 1883.

Of some 250 or 300 samples purchased of manufacturers and grocers, he finds considerable variation in regard to strength and purity. The following are the results obtained with reference to the amount of acetic acid:

"2.4 per cent. of the samples contained 2 to 2.5 per cent. of the acid; 3.2 per cent. had 2.5 to 3 per cent.; 15.2 per cent. had 3 to 3.5 per cent; 18.8 per cent. had 3.5 to 4 per cent.; 25.6 per cent. had 4 to 4.5 per cent.; 12 per cent. had 4.5 to 5 per cent; 10.8 per cent. had 5 to 5.5 per cent.; 3.2 per cent. had 5.5 to 6 per cent.; 2.8 per cent. had 6 to 6.5 per cent.; 2.4 per cent. had 6.5 to 7 per cent,; 1.2 per cent. had 7 to 7.5 per cent.; 1.6 per cent. had 7.5 to 8 per cent.; 0.4 per cent. had 8 to 8.5 per cent., and 0.4 per cent. had 8.5 to 9 per cent of acetic acid. Thus 77.2 per cent. of the samples fell below the at least 5 per cent. of acid proper to a straight, whole, undiluted cider-vinegar, while only 22.8 per cent. of them reached or surpassed it."

With regard to purity, the report continues:

"No vinegar, however, was found containing free mineral acids, a dangerous amount of metallic impurity, or with much of any of the acrid vegetable substances that have at times been found in vinegars.

"So-called cider vinegars ranged in acid strength all the way from 2.1 to 9 per cent. of acetic acid, and in respect to solid residues from 0.1 to 9.7 per cent."

ADULTERATION IN GERMANY.

The volume of reports from consuls of the United States, published by the Department of State for February 1883, being No. 28 of the series, contains a report by Mr. George C. Tanner, U. S. Consul at Liege, in which it is stated that the business of adulteration is an extensive one in Austria and Germany. He says:

"The science of dilution is carried into everything that is liquid, and adulterations into everything that is solid. Their wines, liquors and beers, their medicines, and even their mineral waters are full of all kinds of concoctions and foreign ingredients, that are dangerous to health.

"Even their woolen goods are adulterated with wool made from rags; the rags are passed through a machine, reconverted into wool, then made into cloth, and largely exported into the United States.

"It is well known, and abundantly proved, that cloth made from such wool retains through all its transformations and rough handling germs of disease and disseminates them broadcast. A German, dying of small-pox, his clothing becomes useless for other purposes than old rags. The adulterations of his cloth do not stop here. They sandwich in with the wool of rags, and a small proportion of pure wool, a new *fiber*, known as cosmos, just brought into use as an adulterant and which is considered by recent investigation to be injurious to health. * * *

"Our flour, when found in these countries, becomes foreign to such an extent as to be beyond recognition.

"Our lard is also doctored in many ways, tallow and horse-fat being the most conspicuous adulterations. If evil consequences follow from such wholesale adulterations (as often happens), there is always a means of escape, and the German loses no time in availing himself of it. He sings out lustily that it is in consequence of American adulterations."

We have quoted enough to prove to any one familiar with the subject, that Mr. Tanner has written a string of absurd rubbish, abusing and vilifying two great nations, because—well, because he thinks it necessary to make reprisals for the prohibition by the German authorities of the entrance of American pork into their dominions.

That the German Government has done a very foolish thing in this legislating against American pork, there is no doubt; but that Mr. Tanner has also done a very foolish thing, in forwarding this tirade, and the State Department in publishing it, is equally certain. He furnishes no evidence as to the truth of his statements, and some of them are certainly false, such for instance, as the preservation of germs of disease in cloth containing shoddy, and his insinuation that the clothing of those dying from small-pox is thus worked over. Adulterations are practiced in Germany as elsewhere; they are rarely injurious to health, as the experience of their numerous and skilled sanitary officials has shown; and the idea of Consul Tanner, that the German people adulterate everything they get from America, largely, in order to raise an outcry against them and to prevent further importations, is simply ludicrous. His letter reminds us of the method of warfare employed by certain small boys, who, having a proper fear and respect for a somewhat larger boy whom they dislike, proceed to make faces at his sister.

Our producers of pork and flour have no need for anxiety as to the action of Germany with regard to these articles of food; if they are cheaper than those produced in Germany, they will either go there, or the Germans will go where they can get them.

A committee on sanitary affairs has been appointed at Trenton, with Dr. Phillips as chairman.

At Wilmington, Del., the mayor has named the following as members of the new board of health: Drs. L. P. Bush and A. H. Grimshaw, physicians; Seth Feaster, business man, and Alfred Gawthrop, plumber. Dr. Willard Springer, port physician, and M. C. Conwell, chief engineer of the surveying Department, were stated to be members *ex-officio* of the board.

Mayor Low, of Brooklyn, has vetoed the resolution permitting the planting of trees in front of the City Hall. Health Commissioner Raymond has condemned 116 wells.

Dr. Charles S. Goodrich, who was health officer of Troy, N. Y., during the cholera epidemic of 1832, died at Brooklyn, recently.

The *Maryland Medical Journal*, beginning with the first number of its tenth volume, May 3, will be issued every week.

NEW YORK WATER WORKS STATISTICS.

At the request of an English correspondent we have obtained the following *data* from Mr Isaac Newton, Chief Engineer of the Croton Aqueduct, and Mr. J. J R. Croes, C.E.

The estimated population of the city at the end of the year 1882 was about 1,280,000, which was the approximate number supplied with water, exclusive of the floating population; annual rate of increase, 26,430.

The service is continuous, supplying approximately 100,000,000 gallons daily. The aqueduct is kept running at its full capacity all the time (*i. e.*, at what is considered its maximum safe capacity), and the daily fluctuations of the distributing reservoir are very slight. Of the above quantity, during the year 1882, an average of 13,648,000 gallons per day was supplied through meters, yielding a revenue (for the year) of $376,099.47.

The expenditures and receipts during the year 1882 were as follows:

EXPENDITURES.

For construction	$1,305,640.78
" maintenance	382,936.07
" Interest on bonds	637,625.00
Total	$2,326,201 85

RECEIPTS.

From consumers, by water rents	$1,722,861.38
" tapping pipes, water meter fund, etc.	31,415.02
" property, by direct tax	1,149,201.09
Total	$2,903,477.49

The following summary of a statement prepared by Mr. Croes shows the total receipts and expenditures of the water works from 1829, when the laying of pipes in the streets for a public water supply began, to the close of 1882:

EXPENDITURES FOR THE NEW YORK WATER SUPPLY FROM 1829 TO 1882.

For construction	$35,017,837 72
" maintenance	5,726,435.07
" interest and discount on bonds	30,897,093.61
Total	$71,641,366.40

SOURCES AND AMOUNTS OF REVENUES OF THE NEW YORK WATER SUPPLY FUND FROM 1829 TO 1882.

From consumers, by water rents	$37,562,670.42
" miscellaneous sources, sales of materials and premium on bonds	674,230 35
" property by direct tax	17,421,615.31
Total	$55,658,516.08

LIVERPOOL CORPORATION WATER WORKS.

LIVERPOOL WATER SUPPLY FOR YEAR ENDING DECEMBER 31, 1882.

Average quantity supplied per day to Liverpool and out-townships:

	Gallons.
From Rivington	11,385,284
From Wells	5,459,071
Total	16,844,355

Average population supplied, 714,057.

Average rate per head per day.

	Gallons.
For domestic, miscellaneous trade, sanitary and public purposes	17.16
Water supply through meter	5.89
Total for all purposes	23.05

WATER DEPARTMENT, MUNICIPAL OFFICES, LIVERPOOL, March, 1883. } J. PARRY.

CHORLEY WATER SUPPLY FOR YEAR ENDING DECEMBER 31, 1882.

Average population supplied, 18,289.

Average rate per head per day.

	Gallons.
For domestic, miscellaneous trade, and public purposes	8.09
For trade supplies through meter	2.95
Total for all purposes	11.04

For corporation stock 2,348
——13,101

Total..... 79,872

WATER DEPARTMENT,
MUNICIPAL OFFICES,
LIVERPOOL, *March*, 1883. } J. PARRY.

BOSTON CITY ENGINEER'S REPORT.

The City Engineer of Boston has charge of a great variety of work. He superintends the grading of streets, the care and maintenance of 54 bridges within the city limits, supported in whole or in part by the city, and 35 bridges supported by railroad corporations, the maintenance of the water works, the construction of the improved sewerage, and the engineering work connected with the new parks. His report for the year 1882 is a concise statement of the work done on each of these works.

Regarding the water supply, he states that the quantity furnished by the Cochituate and Sudbury Works was 3 per cent. more, and that furnished by the Mystic Works 8½ per cent. less than in the previous year. The total consumption was one per cent. greater than in 1881.

The great work of constructing the intercepting and outfall sewers and the reservoir on Moon Island, from which the sewage is to be discharged just after high water, when the current is setting out of the harbor, has made fair progress. The system is "in condition for use up to and including the point where the sewage is raised high enough to be discharged into the outer harbor, and beyond this point it can probably be put in condition for use within a year."

In the tunnel under Dorchester Bay, an interesting experiment is noted, to determine to what extent the porosity of the brick lining could be destroyed by silting up from outside. Iron pipes had been left in the walls as weep holes for the water, to prevent its washing out fresh mortar. In one section of the tunnel, 800 feet long, these pipes were connected after the completion of the work, with a pipe extending up one shaft, and water containing clay, cement and fine sawdust was pumped in behind the lining. By this means the leakage was reduced from 2,200 to 500 gallons per hour.

An idea of the excellent system of records kept in this department may be had from one remark in the report, which we quote: "The practice has been followed of constantly taking photographs, by the cheap dry plate process, of all points of interest in connection with the contract for the outfall sewer and Moon Island reservoir. These not only furnish an interesting record of the progress of construction and the methods and machinery employed, but may prove of great value as affording indisputable evidence to be used in any possible future disagreement with the contractors concerning the character or condition of the work at any time."

The systematic testing of cement is kept up with excellent results, in compelling dealers to furnish none but a good article. About 38,000 barrels were tested during the year and a number of experimental tests made.

As a comprehensive summary in short space, of the operations of a well managed department, covering a great amount of work, this report is to be commended to city officers who are apt to let their fancy run riot in describing puddle and concrete, forgetting the fact that the best writer is one who uses fewest words to tell his story.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

At the meeting, May 2, arrangements were announced for the St. Paul Convention. A visit will be made to Chicago during the week previous to the Convention. The death of Milton Courtright, Fellow of the Society, was announced. Photographs of a dredge and snag-boat, and of a drilling-scow of peculiar construction, used by J. H. Striedinger, M. Am. Soc., C.E., in the Improvement of the Magdalena River, South America, were presented. The following candidates were elected as members: George H. Benyenberg, Milwaukee, Wis.; J. W. Bishop, St. Paul, Minn.; T. L. Griswold, Lagos, Mexico; Randell Hunt, Fargo, Dakota; F. W. Kimball, Milwaukee, Wis.; C. J. Poetsch, Milwaukee, Wis.; A. H. Scott, Milwaukee, Wis.; D. C. Shepard, St. Paul, Minn.; J. A. Smith, Indianapolis, Ind.; G. H. White, Minneapolis, Minn., as Junior; G. A. Lederle, Bismarck, Dakota.

A paper, by Professor J. A. L. Waddell, M. Am. Soc., C.E., "Suggestions as to the Conditions proper to be required in Highway Bridge Construction," was read by the Secretary, and discussed by Messrs. Cooper, Haight and Macdonald.

THE AMERICAN WATER WORKS ASSOCIATION.

The Third Annual Meeting of this Association will be held in the City of Buffalo, N. Y., May 15, 16 and 17. Reduced rates for the accommodation of members have been secured at the Genesee House, which will be the headquarters of the Association. Papers of general interest will be presented, and at the close an excursion to Niagara Falls is promised.

MEMPHIS.

Some time ago, following an examination into the sewerage of Memphis by a committee from Dubuque, Iowa, reports were circulated about an increase of ill health in Memphis since the sewers were laid. To confute these, Mr. Niles Meriweather, City Engineer of Memphis, has written a letter to Mr. Tschirgi, City Engineer of Dubuque, in which he says it is simply absurd to ascribe any sickness to the sewers, and the health of the city is excellent. We have already discussed this matter at length and shown how unfounded these rumors were.

BALTIMORE PLUMBERS.

BALTIMORE, *May* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

Thinking it might be interesting to some of your readers, and hoping it may be the means of determining some city which has not yet made up their minds to join the National Organization, I thought I would inform you what we have been doing here; we have on the roll sixty-three members, and hope the infection may continue to spread, and at an enthusiastic meeting last Thursday evening the following officers were elected: President, Jno. W. Bechtel, No. 129 Saratoga street; Vice-President, Wm. H. Rothrock, No. 37 Light street; Rec. Sec., James Millar, Jr., No. 85 Richmond street; Financial Sec'y, Peter Kreis, No. 163 W. Fayette street; Treasurer, Geo. Knipp, Nos. 42–44 N. Howard street; Directors, Jno. McCart, No. 84 N. Calvert street; D. B. Foster, No. 39 Clay street; Jas. Healey, cor. Calvert and Centre streets; H. C. Bowman, No. 119 N. Howard street; Jas. A. Thornton, No. 466 Pennsylvania avenue. J. M., JR.

CHICAGO MASTER PLUMBERS.

"The master plumbers of Chicago, at a meeting May 3, President D. J. Rock presiding, selected Grand Army Hall, No. 167 Washington street, as the place of future meetings, and adopted the following minutes:

"The Sanitary Committee would call the attention of the Association to the practice generally in use in regard to foot connections with soil pipes. The turning up of the sewer pipe bend is responsible for one-half of the complaints of sewer air or gas in buildings, the connection being broken off by the settling of the building, action of frost, etc. Remedy: the bend at the foot of the soil pipe should be a continuation of the same, and from the bend iron pipe added in distance, at least, of a length of sewer pipe. A connection made in this manner and resting on the solid earth and securely cemented, will be below the action of frost, rats, etc."

PLUMBING LAW VIOLATIONS.

Twenty-one violations of the plumbing regulations were reported last week to the Health Department of this city by the following inspectors: Elliott, seven; Dickinson, six; Hooper, four; Hollick, two; Eagleson and Hicnbothem one each. Most of the cases were not serious. Among the worst was one sewer connection for four houses (Nos. 125 to 131 Third avenue, owned by Charles A. Buddensick), reported by Eagleson. Cement caulked iron drain was reported by Hollick in a house owned by C. Karst, on the north side of 80th street, between 1st avenue and Avenue A. Five cases were referred to the attorney. No violations of light and ventilation plans were reported.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

NEW EXTENDED SURFACE RADIATOR.

Our representation illustrates a new departure in extended surface of steam radiators.

It may properly be called *secondary surface*, as it is not a part of the pipe or plain surface, but a detached integral which depends on its conductivity and power to intercept radiant heat from the primary coil which it again communicates to the air.

The pipes of ordinary box coils are wound with spiral turns of No. 12 galvanized iron wire, which has been annealed, with the intention of making close contact at

the greatest number of places on the pipe, and which it is claimed will remain in strong elastic tension around the primary surface.

The inventor claims that he conducted comparative tests on two coils—one eight pipes high and ten pipes wide without wire, and one four pipes high and ten pipes wide with wire—that with air entering the coil chambers at three degrees above zero, Fah., and all other things as nearly equal as he could make them, he delivered air at 160° Fah. from the coil with the secondary surface while the air from the plain coil was only 120°.

He calls the indirect radiators made on this principle "compound coils," and claims more surface in a smaller space than by ordinary methods, and says it is peculiarly adapted for forced circulation of air.

The inventor is Samuel F. Gold, of Englewood, N.J., the inventor of the "Pin Radiators."

Construction Notes.

COLUMBUS, O.—The following bids for completing the main trunk sewer were received by John Graham, City Engineer, April 30: Northwest sewer; Patrick Maloney, Washington, D. C.—Brick masonry, $11.70 per thousand; excavating, 37¾ cents per cubic yard; pine lumber, $22 per thousand feet; oak lumber, $35; iron man-holes, $7 each. F. Fornof and John Crenane, Columbus—Masonry, $10.83; excavating, 39 cents; pine lumber, $17; oak, $17; man-holes, $8.50. Thomas Connell & Co., Youngstown.—Masonry, $11.33; excavating, 44 cents; pine lumber, $22; oak, $22; man-holes, $15. Columbus Paving Co.—Masonry, $11.25; excavating, 57 cents; pine lumber, $20; oak, $22; man-holes, $16.

Estimate of quantities: 4,944,518 brick, 70,738 cubic yards excavation, 33,910 feet lumber, 14 manhole tops and covers.

NASHVILLE, TENN.—The contract for the 10,000,000 gallon pumping engine has been awarded to the Holly Manufacturing Company at $90,000.

The Holly Manufacturing Company, of Lockport, N. Y., has been awarded the contract by the city of West Bay City, Michigan, for two compound condensing water works pumping engines, each of 1,500,000 gallons daily capacity.

NEW YORK.—At the Board of Education, the contract for erecting a new school building at Avenue A and 119th street was awarded to Joseph Spear at $125,315. The contract for erecting two stairways to Grammar School House No. 11 was awarded to the firm of Mallon & Rourke at $3,144.

NEW YORK.—The contract for the construction of a boiler house (including kitchen, laundry, office, etc. (for the new small-pox hospital on North Brothers Island, was awarded by the Health Commissioners, on the 7th inst., to Mahoney Bros., for $32,250, and $2 per cubic yard for rock excavation.

At the office of the Department of Public Charities and Corrections the contract for the plumbing work and materials for pavilion at almshouse, now in course of erection on Blackwell's Island, was awarded to George Hickenbotham, at $1,430.

A bill has passed the Assembly authorizing the superintendent of public works to construct a reservoir on the Black River, at Forest Port, Oneida county.

ALLEGHENY, PA.—The committee of experts on pumping machinery have reported, recommending the Gaskill pumping engine manufactured by the Holly Manufacturing Company.

HOLYOKE, MASS.—City Engineer Tower has prepared plans for a sewer on Cabot street, 2,000 feet long.

JOLIET, ILL.—The Joliet Water Company was incorporated April 30. Capital $150,000.

NEW BRITAIN, CONN.—In the Connecticut Legislature a bill has passed the Senate authorizing the water commissioners to take streams and land, after appraisal, for the purpose of improving the water facilities of the city.

WILMINGTON, DEL.—The Delaware Legislature has created a Board of Water Commissioners for the City of Wilmington. The three commissioners are named in the bill. The term of office is to be six years, except for those first appointed, one of whom goes out of office every second year. The Board has power to fill vacancies in its own membership for an unexpired term, but "all the members of the Board shall not at any one time belong to the same political party." Heretofore the control of the water works has been in the hands of the City Council.

A Cincinnati man proposes to operate a kind of perpetual motion, by taking the sewage from the hills around the city in pipes to the foot of the hills, there driving turbines with it, and transmitting the power by wire ropes to the top of the hill to work machines for purifying the sewage before it enters the pipes. We suppose that the man who is to tend the machinery will go to the foot of the hill to oil the turbine shaft, and lift himself to the top of the hill by the straps of his boots.

In Memphis, Tenn., between February 1, 1879, and December 1, 1882, there were 10½ miles of streets paved and repaved with block-stone, Telford-Macadam and rubble, 30,800 square yards of wharf paved with stone, and 34½ miles of new sewers built.

The *Trenton State Gazette* has just got hold of M. Durand-Claye's description of the irrigation works at Gennevilieus, and does "not know that it would be wise for Trenton to undertake to adopt this system, at least for the present. *In the first place there is no engineer accessible to us, who understands it sufficiently in detail, to give us a complete plan.*" We were not before aware that access to Trenton, from New York and Boston, was so difficult. Unless we are greatly deceived, there are several engineers in those cities competent to the task.

MADISON, WIS.—The new water works do not seem to be entirely satisfactory. The *State Journal* says that "there is friction at every movement, the contractors fail, and the city authorities seem to lack nerve." The engine foundations have settled, and have to be rebuilt. A partial supply has been obtained, but no considerable portion of the citizens are yet supplied. One well of five-inch bore and 750 feet deep has been bored. A second well was intended to be of eight-inch bore, but "after all sorts of delays, it was bored some two inches less in diameter than was intended, and with this partial failure the contractor packs up his tools and leaves the ranch." The *Journal* adds: "We are willing to stand anything within reason, but such sloppy work as has existed thus far in the matter of our city water works cannot always be endured without a protest."

The Boston Common Council confirmed Mr. William Taylor as Health Commissioner, by a vote of 46 out of 71. In the discussion on the habits of the nominee, Mr. Bromwich said, that "if he suffered from occasional inebriety, he shared the disease with nine-tenths of the members of the Council." This personal appeal to a fellow-feeling settled the matter.

The Boston Common Council have fixed the salaries of the Water Commissioners at $5 for each half day's service, and postponed the confirmation of the new nominees for two weeks, so that they could be brought under this rule, instead of the old one of $3,000 per year. A day's work in the City Hall was stated to be from 10 A.M. to 5 P.M., with an hour out for dinner.

The Selectmen of Bridgewater, Mass., have petitioned the Legislature to prevent the discharge of sewage from the State Normal School into Town River.

One of the Chicago pumping engines having been stopped for repairs, complaints of lack of pressure in the mains are made from all parts of the city. The city engineer tries to impress on consumers the necessity for economy in the use of water.

GOVERNMENT WORK.

Memorandum of bids received and opened on April 28, 1883, by General M. C. Meigs, Supervising Engineer and Architect, for furnishing sixteen cast iron columns for gateway of new Pension Building:

J. M. Duclo, New York	$75.00 each.	
Haugh, Ketcham & Co., Indianapolis, Ind.,	767.68 for all;	$47.97 7/16 each.
Jas. Perrottett, Columbia, Pa	63.00 each.	
Robt. Wetherill & Co., Chester, Pa	78.00 "	
Snead & Co., Louisville, Ky	46.50 "	
Phœnix Iron Co., Trenton, N. J	1,627.00 for all	101.68 7/16 each.
Joseph Hall & Co., Richmond, Va	53.00 each	
Wm. H. Jackson & Co., New York	59.68 "	
J. B. & J. M. Cornell. New York	1,611.00 for all;	101.31 12/16 each.
Cheney & Hewlett, New York	1,056.00 for all;	66.00 each.
Rittenhouse & Son, Morristown, Pa	65.00 each.	
Central Iron Works, Brooklyn, N. Y	40.00 "	
Mitchell & Shepherd, Philadelphia, Pa	70.00 "	
George White & Co., Washington, D. C.	47.00 "	
W. Bollman, Baltimore, Md	55.00 "	
C. A. Schneider & Son, Washington, D.C.	45.41 "	

Custom House, St. Louis, Mo.—Synopsis of bids for iron railing for areas, received under advertisement of April 14, 1883, and opened May 4, 1883:

Christopher & Simpson, St. Louis, $1,614; J. H. Van Dorn, Cleveland, $1,067.72. Knisely Miller, Chicago, $2,088; Snead & Co., Louisville, $1,118: Champion Iron Fence Co., Kenlon, O., $1,213.25; Haugh, Ketcham & Co., Indianapolis, $1,097.60; Ætna Iron Works, Quincy, Ill., $869; Scherpe Koken, St. Louis, $1,600; Stupp Brothers, St. Louis, $1,882.75.

No award yet.

T. Aspinwall & Son inform us their bid for floor tiling for the Custom House and Post Office at Albany was $5 325 not $3,825, as reported by our correspondent.

Pierson & Denike removed from 616 6th Avenue to 600 6th Avenue.

Philip Brady, from 861 to 863 6th Avenue.

Stephen Lane, Jr., from 12 Chambers Street to 951 6th Avenue.

A. Low, from 951 6th Avenue to 823 6th Avenue.

Vaux & Radford, architects and engineers, have removed their offices from 71 Broadway to Rooms 74, 76, 78, Bible House.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

ABBREVIATIONS.—*b s*, brown stone; *br*, brick; *br st*, brick store; *b s dwell*, brown stone dwell; *apart house*, apartment house; *ten*, tenements; *ea*, each; *o*, owner; *a*, architect; *b*, builder; *fr*, frame.

NEW YORK CITY.

Greenwich st, Nos. 228 and 230, br store; cost $15,717; o, Mary C. King; a, Geo. M. Huss; b, G. M. Platt and H. M. Smith & Son.... 46 Pine st, br office building, cost $74,000; o, Com. Union Assur. Co.; a, G. E. Harney; b, D. H. King, Jr....74 and 76 Beach st, br apart h; cost $24,000; o, William Rhinelander; b. F. Bloodgood and J. C. Doremus.... Broadway, n w cor 35th st, br. theatre; o, Hyde & Behman; a, John Sexton....Madison av, e s, 50.5; s 58th st, brown st dwel; cost $30,000; o, Julia Valentine; a, Thom & Wilson; b, Sinclair & Wills.....Madison av, e s, 75.5 s 58th st, brown st dwel; cost $30,000; o, R. H. L. Townsend; a, Thom & Wilson; b, G. Culgin and Sinclair & Wills ...316 E. 40th st, br tenem't; cost, $15,000; o, Joseph and Robert Gordon; a, A. Wagner; b, Gordon Bros.. .42d st, n s, 218 e 1st av, br dwel; cost $3,000; o, Wilson & Adams; a, and b, Chas. Graham & Sons....88th st, s s, 107.9 e of 4th av, brown st apart h; cost $18,000; o, Morris Keller; a, Chas. Baxter....106th st, s s, 100 w Lexington av, br and terra cotta church; cost $80,000; o, Rev. W. P. Flannelly....121st st, n s, 125 n 2d av, three br. dwel; cost each $16,000; o, Michael Fay; a J H. Valentine....62d st, s s, 150 e 2d av, two br tenem's; cost, each $14,000; o, Morris Steinhart; a, B. Ogden....Av A, s w cor 82d st, br tenement; cost $26,000; o. Susan A. Wright; a, Cleverdon & Putzel. .. Madison av, s e cor 87th st, six brown st dwel; cost $25,000 and $15,000; o, J. Macdonald; a, J. Brandt....97th st, n s, 100 w 3d av, five brown st tenem't; cost each $18,000 and $15,000; o, Simon Habermann; a, J. Brandt.... 285 and 287 60th st, n s, 325 11th av, two br tenem'ts; cost each about $9,000; o, Mrs. M. J. Largan; a, G. W. Prodgers; m, J. Mallon & Sons; c, not selected... Manhattan st, n s, 98 e 10th av, two br tenem'ts; cost, each $15,000; o, Peter McCormick; a, J. H. Valentine ....34 to 56 W. 130th st, twelve br dwel; cost $11,000 each; o, Wm. Astor; b, Jas. Webb & Son and John Downey ...146th st, s s, 200 e 10th av, five fr dwel; cost each $2,350; o, Alexander Frazer; a, W. H. Berrin....142d st, s s, 61 e Ryder av, fr tenem't; cost $6,000; o, Mary Wilson; a and b, Geo. T. Campbell....Decatur av, n e cor Suburb av, four fr dwel; cost each $3,000; o, Chas. Hedden; b, J. Richardson.

BROOKLYN.

Dean st, s s, 200 e Washington av, two br tenements; cost each $5,000; o, Thos. Monahan; a, I. D. Reynolds; b, Thos. Donnelly.... Reid av, w s, 24 n Quincy st, eight brown stone dwel; cost each $4,800; o, H. Batterman; a, A. W. Dickie; b, Burroughs & C. L. Johnson..... Reid av, n w cor Quincy st, brown stone dwel; cost $7,000; o, etc., same as last....5th st, n s, 212 e 5th av, four brown st dwel; cost each $5,000; o, and b, P. Mullady; a, Parfitt Bros.... Van Buren st, s s, 24 w Sumner av, six brown stone dwel; cost each $5,000; o, and b, Patrick Concannon; a, I. D. Reynolds....Van Buren st, s w cor Sumner av, brown st flats; cost $10,000; o, and b, Patrick Concannon; a, I. D. Reynolds....Halsey street, s s, 240 e Lewis av, three brick dwel; cost each $5,550; o, L. N. Nichols.... Meserole av, s e cor Newell st, fr tenem't; cost $5,000; o, James Burke; a, F. Weber; b, John Fallon....Franklin av. w s, 100 n Greene av, brown st dwel; cost $5,500; o. and c, Myron C. Rush; a, George P. Chappel; m, Cornelius King....384 and 386 McDonough st, s s, 170 e Stuyvesant av, brown st and br orphan asylum; o, Hebrew Orphan Asy. Soc; a Theobald Engelhard; b, U. Maurer and C. L. Johnson....Judge st, e s, n 132 Powers st, fr tenem't; cost $5,800; o, Gabriel Gengler; a, George Hillenbrand; b, Wm. Bayer and Chr. Wieber.

ALTERATIONS, NEW YORK CITY.

7 E. 32d st, br extention; cost $20,000; a, D. and J. Jardine....243 E. 25th st; cost $5,000; o, Sophia Steins; a, Thos. F. Houghton ..61 W. 36th st, br extension; cost $8,000; o, Francis Hitchcock; a, McKim, Mead & White; b, J. C Miller ...5, 7 and 9 Jacob st, br extension; cost $5,000; o, David Moffatt; a, J. C. Cady & Co.; b, W. and T. Lamb, Jr....4 W. 47th st, br extension; cost $3,000; o, Meeker & Hedden; a, and b, J. Richardson ...Fulton av, w s, 127 s 170th st, br extension; cost $2,500; o. Caroline Zeltner; a, J. Kastner....20 and 22 E. 75th st, br extension; cost $5,000; o, William S. Maddock; superin. Maclays & Davies; b, not selected....23 Ludow st, br extension; cost $4,500; o, Harris Baum; a, W. Graul ..Broadway, w s cor 49th st. br extension; cost, $2,700; o, J. Watts De Peyster; a, Thos J. Drummond; b, R. Drummond & Son....70th st, s s, 20 w Madison av, br extension; cost $10,000; o, Stephen Barker; a, G. A. Schellinger.... Wall st. n w cor Front st, interior alteration; cost $5,000; o, Ellen S. Auchmuty; a, H. J. Hardenburgh; b; J. L. Hamilton....59 E. 66 st, br extension; cost $5,000; o, Wm. Hoyt; a, W. B. Tubby; b, W. and T. Lamb, Jr.

ALTERATIONS, BROOKLYN.

437 Manhattan av, interior alterations, fr extension; cost $5,000; o, George Bullwinkle; a, F. Weber; b, M. Vogel and H. Eggers....75 State st, br extension; cost $9,000; o, Mrs. C. Gilmore; a and b, H. D. & W. A. Southard.

BALTIMORE, MD.—Hoffman st, n s, br bldg; o, Mary A. Albert.... Balton n. w. cor Wilson, br bldg; o and b, E. E. Shipley.... Paterson Park ave, e s, br bldg; 2 story back bldg; o and b, Geo. Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

269,131. MACHINE FOR BENDING GAS PIPE, etc. JOSIAH C. SPRING, St. Louis, Mo. Filed Feb. 28, 1882. (No model.) Issued Dec. 12, 1882.

Claim.—The frame A, having projections *a* a^1, shafts B C, pulley D, pinion E, wheel F, grooved rollers G H I, arbors *h i*, adjustable block J, screw rod K, and hand wheel L, all arranged substantially as and for the purpose set forth.

269,138. STOP OR GATE VALVE. FRANCIS H. TREAT, Joliet, Ill. Filed Dec. 27, 1881. (No model.) Issued Dec. 12, 1882.

Claim.—In stop or gate valves in which the gates consist of disks which move loosely across the pipe opening, the valve or operating stem provided with cone P, in combination with the disks M, provided with contact or saddle pieces O, the whole operating to force said disks to a tight bearing upon their seats, substantially as set forth.

269,156. MEANS FOR SUPPLYING WATER TO HOUSES. ANDREW CAMPBELL, Brooklyn, N. Y. Filed April 10, 1882. (No model.) Issued Dec. 12, 1882.

Brief.—Water rises in reservoir L through pipe G by the pressure in the main. The waste water from the basins is collected in reservoir O, and is used to operate a pump, N. This pump draws water from reservoir L through pipes M and T and forces it into reservoir R through pipe S. When the basin cock *k* is turned (see Fig. 4) hot

water is forced from boiler W by the pressure in reservoir R through pipes *i*, G^1, *d* and Z, the channel w^1 (Fig. 4) uniting the two parts of pipe i^1. When basin cock k^1 is turned the same result is obtained through pipe i^1. When the cock is turned for hot water the automatic valves *g* and g^1, Fig. 2, rise and close the pipes *e f*, which admit water into the kitchen, thus allowing the water to rise in pipe Z.

Claim.—1. As a means for raising water to an elevated reservoir or point above the level of the water supply, a storage reservoir of fountain head, a pump arranged to receive water from the storage reservoir or fountain head and to force it up to the elevated reservoir, and a motor engine to drive the pump, arranged to receive and be operated by a head of waste water from above the fountain head, substantially as set forth.

2. As a means for raising water in houses to a higher level than is due to the pressure in the main, the combination of a storage reservoir, L, connected with the service pipe, a pump supplied from said reservoir, a supply reservoir, R, connected with and arranged to be supplied by the pump, a waste reservoir, O, and a water motor supplied from reservoir O, and arranged to drive the pump, said reservoir O being arranged at a greater height above the motor than the reservoir R is above the reservoir L, substantially as set forth.

3. The means for supplying hot water to the upper floors of a building, which consists of an elevated supply reservoir arranged above the level due to the pressure or head in the main, the service pipe provided with the check valve, a pipe connecting said reservoir with the service pipe beyond the check valve, a boiler arranged to receive water from the service pipe beyond the check valve, a hot water pipe from the boiler to the cock, and said cock arranged below the supply reservoir, all combined and arranged substantially as set forth.

4. The means for cutting off the supply of water in the kitchen when hot water is being drawn on the floors above, which consists of an elevated supply reservoir, the service pipe provided with a check valve, a pipe to connect the service pipe with said reservoir, a boiler arranged to receive water from the service pipe beyond the check valve, a hot water pipe from the boiler to the cock on the upper floor, the said cock, an automatic cut-off, constructed substantially as described, arranged in the hot water pipe, and arranged to cut off the supply of hot and cold water to the kitchen when communication is established between the supply reservoir and the main, and means for cutting off and establishing at will such communication, all combined and arranged substantially as set forth.

5. The combination, with the elevated supply reservoir connected with the service pipe, of the said service pipe provided with a check valve, the boiler connected with the service pipe beyond the check valve therein, the hot water pipe from the boiler to a cock and having fixed in it an automatic cut-off, constructed to operate as described, and the hot water cock constructed and arranged to open communication between the boiler and the elevated reservoir simultaneously with the turning on of the hot water, substantially as set forth.

6. The hot water cock comprising stem *u*, nozzle u^1, and plug *v*, said plug being provided with the hot water channel *w* and the cross channel or bore w^1, in combination with the hot water branch pipe *j* and the cold water branch pipe *i*, all constructed and arranged to operate substantially as and for the purposes set forth.

7. The automatic cut-off, comprising the barrel *l*, having a lateral branch, *e*, and an enlargement, l^1, the cylinder *n*, coupled to the piston *p*, and said piston provided with a guide stem and spring, all constructed, combined and arranged to operate substantially as set forth.

269,177. LEAD TRAP OR CESSPOOL. ALEXANDER CHAPMAN, Montreal, Quebec, Canada. Filed Aug. 9. 1882. (No model.) Issued Dec. 19, 1882.

Claim.—A lead trap made up of separate inlet, intermediate, and discharge pipes, and separate caps covering the bends, their meeting edges being joined together edge to edge without overlapping, and joined lead to lead without solder, substantially in the manner and for the purpose set forth.

269,234. PIPE-WRENCH. EDWIN A. ROBBINS, Boston, Mass. Filed Oct. 2, 1882. (No model.) Filed Dec. 19, 1882.

Claim.—1. The combination, with the stationary jaw F, having bar C, adjustable jaw H, having screw-threaded shank L, and adjusting-nut P, of the fulcrumed lever-handle connected with the periphery of the said adjusting-nut, so as to actuate the said adjustable jaw toward and from the stationary jaw by movement of said handle, substantially as described, as and for the surposes set forth.

2. The combination, with the stationary jaw F, bar C, adjustable jaw H, shank L, and adjusting-nut P, of the fulcrumed lever-bar B, provided with the hook S and shoulder U, and stops, substantially as described, as and for the purposes set forth.

269,246. PORTABLE WATER CLOSET. GEORGE E. WARING, JR., Newport, R. I., assignor to the Drainage Construction Company, Boston, Mass. Filed Apr. 17, 1882. (No model.) Issued Dec. 19, 1882.

Claim.—As a new article of manufacture, a portable water closet consisting of a bowl or hopper, a finished floor, seat and casing, ready to be connected to the water supply and waste pipes without the aid of a carpenter.

269,260. WATER AND STEAM METER. AUGUST C. CHRISTENSEN, Brooklyn, N. Y. Filed July 20, 1882. (No model.) Issued Dec. 19, 1882.

Claim.—The combination of an inclosing-casing having a chest at the upper part and diagonal channels at the lower part, reciprocatory plungers or pistons having channels forming slide valves, and valves resting loosely on said plungers and operated by contact with the casing, substantially as described.

2. In a water and steam meter, the combination of an inclosing-casing having a chest at the upper part and two sets of diagonal channels crossing each other at the lower part, two reciprocatory plungers or pistons having channels which form slide-valves, two double gridiron slide valves having curved under faces resting on said plungers and communicating with openings therein, one-half the openings to each gridiron-valve being closed while the other half is open, substantially as described.

269,047. HEATER ATTACHMENT FOR STOVES. NAMAN J. GRAHAM, Jackson, Ohio. Filed July 29, 1882. (No model.) Issued December 12, 1882.

269,083. VAPOR BURNER. THOMAS D. MCCORMICK, Clinton, Ohio. Filed August 14, 1882. (No model.) Issued December 12, 1882.

269,085. CONDUIT FOR ELECTRICAL CONDUCTORS. JOHN K. MCLAUGHLIN, Philadelphia, Pa., assignor of one-half to Lewis H. Taylor, Jr., same place. Filed January 27, 1882. (No model.) Issued December 12, 1882.

269,086. CONDUIT FOR ELECTRICAL CONDUCTORS. JOHN K. MCLAUGHLIN, Philadelphia, Pa., assignor of one-half to Lewis H. Taylor, Jr., same place. Filed January 27, 1882. (No model.) Issued December 12, 1882.

269,087. APPARATUS FOR REGULATING THE SUPPLY OF GAS. JOHN MCLENNAN, 84 Finsbury Park Road, and RICHARD OWEN, England Lane, Haverstock Hill, County of Middlesex, England. Filed December 10, 1881. (No model.) Patented in England, March 11, 1880, No. 1,055. Issued December 12, 1882.

269,114. STEAM BOILER. GARRIE H. RHEUTAN, Hartford, Conn. Filed June 6, 1882. (Model.) Issued December 12, 1882.

269,115. FIRE GRATE. PHILIP RICHARDS, Wilkes-Barre, Pa. Filed October 24, 1882. (No model.) Issued December 12, 1882.

269,145. MEDICAL COMPOUND. JOHN S. H. WHEATON, Crisfield, Md. Filed Oct. 18, 1882. (No specimens.) Issued Dec. 12, 1882.

269,162. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. HENRY M. PIERSON, Brooklyn, N. Y., and JAMES S. PIERSON, Plainfield, N. J. Filed June 28, 1882. (No model.) Issued Dec. 12, 1882.

269,168. GAS ENGINE. KARL TEICHMANN, Stuttgart, Wurtemberg, Germany. Filed Aug. 14, 1882. (No model.) Patented in England April 28, 1882, No. 2,008; in France April 28, 1882, No. 148,644; in Belgium April 28, 1882, No. 57,745; in Italy April 28, 1882, XVI., 14,148 and XXVIII., 168; in Luxemburg, May 1, 1882, No. 198, and in Austria-Hungary July 7, 1882, No. 1,200 and No. 1,202. Issued Dec. 12, 1882.

269,179. GALVANIC BATTERY. EDWARD M. COINTEPAS, Boston, assignor, by mesne assignments, to Charles H. Ward, Cambridge, Mass. Filed Jan. 20, 1882. (No model.) Issued Dec. 19, 1882.

269,180. FIRE ESCAPE. LEWIS COLLER, Flint, Mich. Filed Sept. 11, 1882. (No model.) Issued Dec. 19, 1882.

269,189. APPARATUS FOR HEATING FREIGHT CARS. WILLIAM E. EASTMAN, Boston, Mass., assignor to the American Freight Car Heating Company, Portland, Me. Filed Aug. 4, 1882. (No model.) Issued Dec. 19, 1882.

269,197 to 269,205. AUTOMATIC FIRE EXTINGUISHERS. FREDERICK GRINNELL, Providence, R. I. Filed Feb. 20, 1882. (No model.) Issued Dec. 19, 1882.

269,217 HOSE NOZZLE. PEARL C. LEWIS, Catskill, N. Y. Filed July 26, 1882. (No model.) Issued Dec. 19, 1882.

269,223. OUTLET FOR TANKS OF STEAM HEATING APPARATUS. EUGENE F. OSBORNE, St. Paul, Minn. Filed Apr. 3, 1882. (No model.) Issued Dec. 19, 1882.

299,224. STEAM PIPING FOR BUILDINGS. EUGENE F. OSBORNE, St. Paul, Minn. Filed Apr. 3, 1882. (No model.) Issued Dec. 19, 1882.

269,236. VENTILATING DEVICE. SUMNER SHAW, Boston, Mass. Filed Apr. 15, 1882. (No model.) Issued Dec. 19, 1882.

269,239. PROCESS OF TREATING INCANDESCENTS. MARMADUKE M. M. SLATTERY, New York, N.Y., assignor to the Slattery Incandescent Lamp Company, same place. Filed Mar. 6, 1882. (No model.) Issued Dec. 19, 1882.

269,241. LAMP-LIGHTER. EDWARD B. SMITH, Richland, Mich., assignor of one-half to Patrick H. Gilkey, same place. Filed Oct. 27, 1882. (No model.) Issued Dec. 19, 1882.

269,243. FEED-WATER HEATER. DANIEL C. STILLSON, Somerville, Mass. Filed Aug. 24, 1882. (No model.) Issued Dec. 19, 1882.

269,244. TUBULAR WELL. RANSOM E. STRAIT, Galesburg, Mich. Filed Dec. 5, 1881. (No model.) Issued Dec. 19, 1882.

269,267. GASOLINE-BURNER ATTACHMENT FOR COOK STOVES. DUANE T. DAVIS, PANA, ILL. Filed Oct. 20, 1882. (No model.) Issued Dec. 19, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

Of an urban population of 6,520,745 there died during the week ending April 28, 2,668 persons, which is equivalent to an annual death rate of 21.7, a decided decrease from the preceding week for which it was 24.2.

For the North Atlantic cities the rate was 21.8; for the Eastern cities 22.7; for the Lake cities 16.9; for the River cities 19.0; and in the Southern cities, for the whites 22.8, and for the colored 32.5 per 1,000.

Of the whole number of deaths 33.2 per cent. were under five years of age, the proportion being highest in the River cities (36.7) and among the Southern colored (37.0).

Accidents caused 2.7 per cent. of all deaths.

Consumption caused 16 per cent. of all deaths. In the North Atlantic cities it caused 17.8; in the Eastern cities 16.4; in the Lake cities 17.0; in the River cities 17.1, and in the Southern cities, for the whites 9.3, and for the colored 11.2 per cent.

Croup caused 1.4; diarrhœal diseases 1.9; and diphtheria 3.0 per cent. of all deaths. In the North Atlantic cities diphtheria caused 2.2; in the Eastern cities 3.1; in the Lake cities 5.9; in the River cities 3.3, and in the Southern cities, for whites .5 and for the colored .6 per cent.

Typhoid fever caused 1.3 per cent. of all deaths, the highest rate from this cause being in the North Atlantic cities, 3.1 per cent. Malarial fevers caused 1.5, and scarlet fever 3.0 per cent. of all deaths.

Pneumonia caused 11.6, and acute bronchitis 3.8 per cent. of all deaths. In the North Atlantic cities pneumonia caused 15.2; in the Eastern cities 12.0; in the Lake cities 10.6; in the River cities 11.1,

Digitized by Google

and in the Southern cities, among the whites, 6.7, and among the colored 8.6 per cent. Measles caused 1.1, puerperal diseases 1.1, small-pox 2.3, and whooping cough 1.1 per cent. of all deaths.

DETROIT, MICH.—Dr. O. W. Wight reports 30 new cases of diphtheria and seven of scarlet fever.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 28 new cases of scarlet fever and four of diphtheria, making 53 cases of the former disease and 16 of the latter on hand April 28.

FRANKLIN, MASS.—Postmaster J. A. Woodward reports the prevalence of mumps during the month of April; with this exception the health of the section was good.

BOSTON, MASS.—C. E. Davis, Jr., reports 39 new cases of diphtheria, 33 of scarlet fever, and nine of typhoid fever.

LYNCHBURG, VA.—Dr. Thos. L. Walker reports the city as free from small-pox.

PITTSBURGH, PA.—Dr. W. Snively reports one case of small-pox.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths during the week, two of which were of children under five years of age. Cerebro-spinal meningitis is reported as having caused two of the deaths.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports 1,363 insane patients remaining under treatment April 28. During the week which ended on that day, there were nine admissions, two discharges, and four deaths.

PROVIDENCE, R. I.—Dr. E. M. Snow states in his report for the week that "the mortality last week was only slightly above the annual weekly average, and is decreasing. The new cases of typhoid fever have almost entirely ceased. The months of May and June are usually the healthiest of the year, and will probably be no exception this year."

BALTIMORE, MD.—During the week ending April 28 there occurred 172 deaths in Baltimore. Males 90, females 82; under five years, 68; over 60 years, 35. The annual rate, as stated by the local health board, was for the whole population, 21.86; for the white, 20.41; for the colored, 30.33. Small-pox caused four deaths, measles one, scarlet fever ten, whooping cough one, typhoid fever four, malarial fevers four, croup one, diphtheria 11, diarrhœal diseases three, puerperal diseases four, consumption 25, bronchitis four, pleurisy one, pneumonia 16, congestion of lungs two, and violence two.

MICHIGAN.—During the week ending April 21, the diseases which caused most sickness in the State were, rheumatism, intermittent fever, neuralgia, bronchitis, consumption, tonsilitis, influenza and pneumonia. Diphtheria was reported as prevailing at 13 places, scarlet fever at 18 places and measles at 22 places. Four cases of measles came with emigrants arriving at Port Huron April 20.

HUDSON CO., N. J.—C. J. Rooney's report for the week ending April 24 was received too late to be inserted in our table for that date. Total mortality 128; under five years, 35. Accidents caused five deaths, consumption 18, croup three, diarrhœal diseases three, diphtheria four, typhoid fever two, scarlet fever nine, pneumonia 21, congestion of lungs one, acute bronchitis four, and puerperal diseases three.

ATLANTA, GA.—Dr. Jas. B. Baird's report for the week ending April 21 also came to late to be tabulated. There were two deaths among the whites, one being under five years; and nine among the colored people, five of whom were under five years of age. Diarrhœa and consumption were the causes to which the deaths among the whites were assigned. Among the colored people two deaths were caused by consumption, two by pneumonia, one by diarrhœa and one by typhoid fever.

DISTRICT OF COLUMBIA.—During the quarter ending March 31 there were 1,200 deaths from all causes, which is 112 more than were recorded during the first quarter of 1882. Small-pox caused two deaths, or 11 less than during the corresponding quarter of the preceding year; scarlet fever 44, an increase of 33; diphtheria 20, a decrease of 16; croup seven, a decrease of 14; whooping cough three, a decrease of three; typhoid fever 19, a decrease of two; malarial fevers 14, an increase of two; diarrhœal diseases seven, a decrease of 12; consumption 227, an increase of ten; pneumonia 140, a decrease of four; bronchitis 32, an increase of five; congestion of lungs 22, a decrease of nine.

WILMINGTON, DEL.—The annual report of the Board of Health for the year ending Dec. 31, 1882, gives a statement of the mortality, from which we abstract as follows: population, 46,500; white 40,000; colored, 6,500. Total mortality, 1,143; white 912, colored 231. Rate per 1,000, white 18.64, colored 35.54, as compared with the rates of 27.4 and 59.7 in 1881, but these high rates brought forward for comparison were due to a small-pox epidemic which prevailed during that year. Consumption caused 162 deaths, or one in 6.8 of the total mortality. Cholera infantum caused 64 deaths; this is by far the most fatal disease which visited the city if the short period of its prevalence is taken into consideration. Diphtheria caused 13 deaths, typhoid fever 51, scarlet fever 22, malarial fevers 13, pneumonia 68, and small-pox 13. The deaths of small-pox patients occurred among 45 cases of the disease.

Of the decedents 506 were under five years of age, and 197 were over 60 years.

ONTARIO, CANADA.—The *Bulletin* for the week ending April 21 attributes the continued prevalence of bronchitis to the variable weather and to the prevalence of measles, to which disease it is often a sequel. Scarlet fever is increasing; in one of the districts its presence in a virulent form has necessitated the temporary closing of the public schools. Diarrhœa is steadily advancing, and municipal authorities are again urged to take measures for the removal of filth, which in its many forms plays the principal part in the causation of this so frequent and fatal malady.

VERA CRUZ.—During the month of March, 102 deaths occurred in the municipality. Seven of the deaths were due to yellow fever.

KINGSTON, JAMAICA.—Of 169 deaths registered during the month of March, seven were caused by fevers, malarial, remittent and typhoid, three by measles, nine by diarrhœa, five by dysentery, 15 by consumption, two by bronchitis, 57 by infantile diseases, and four by violence.

RIO DE JANEIRO, BRAZIL.—Consul General C. C Andrews transmits reports for the weeks ending March 17 and 24. During the first named period there were 303 deaths in the population, which numbers 330,000. Of these yellow fever caused 41 deaths, small-pox eight, typhoid fever one, pernicious fever nine, and consumption 50. If the deaths from yellow fever at the S. Isabel Hospital, the total number from that disease for the week would be about 62.

During the week ending March 24, there were 314 deaths, 52 of which were occasioned by yellow fever. This number does not include those which occured at the hospital. Small-pox caused eight deaths, typhoid fever four, pernicious fever 11, and consumption 37. An English seamen died of yellow fever on March 24. This is the first death from that disease which has occurred among the shipping during the present season.

HONOLULU, HAWAIIAN ISLANDS.—Consul D. A. McKinley reports 50 deaths as having oocurred in March; males 27, females 23; under five years seven, over 60 years 11; consumption caused five deaths, dysentery three, fever one, and leprosy one.

ENGLAND.—Vice-Consul Gen. L. H. Mitchell transmits the return of the Registrar-General for the week ending April 14. The annual rate of mortality in the 28 great towns averaged 24.7 per 1,000, Bristol giving the lowest rate, 16.9, and Hull the highest, 34.0. The mortality from whooping cough was heaviest in Hull and Plymouth; from scarlet fever, in Sheffield and Leeds; and from measles, in Liverpool and Sheffield. The 27 deaths from diphtheria included 20 in London, three in Liverpool and two in Birmingham. Small-pox caused two deaths in London, one in Leeds, and one in Sunderland, but not one in any of the 25 other towns.

LONDON.—Births 2,598; deaths 1,803. The births were 92 below, whereas the deaths exceeded by 42 the average numbers in the corresponding weeks of the past ten years. The annual rate, which had been 28.3 and 25.6 in the two preceding weeks declined to 23.8. Small-pox caused two deaths, measles 57, scarlet fever 14, diphtheria 20, whooping-cough 36, fever 20, diarrhœa eight, and violence 68.

SCOTLAND.—Consul Leonard sends a copy of the return of the Registrar-General for the week ending April 14. The average mortality rate in the eight principal towns was 27.9 per 1,000, or 3.1 above that of the corresponding week of last year. Aberdeen recorded the lowest mortality, 17.1 per 1,000; and Glasgow the highest, 33.6. Whooping cough continues to be the most fatal miasmatic disease; Glasgow recorded 20 deaths from this cause. One death from small-pox was noted in Glasgow, but none in any of the other towns.

Edinburgh—Total deaths 96, equal to an annual rate of 21.2. Measles, scarlet fever, typhoid fever and diarrhœa, each caused one death, diphtheria two, whooping-cough 10, acute lung diseases 26, and violence three.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Proposals.

PROPOSALS FOR BUILDING PART OF LOCK No. 2, GREAT KANAWHA RIVER, W. VA.

U. S. ENGINEER'S OFFICE, 70 SARATOGA ST., BALTIMORE, MD., *April* 23, 1883.

Proposals for building part of Lock No. 2, of the Great Kanawha River Improvement, *West Virginia*, will be received until noon of May 15, 1883, and opened immediately thereafter.
Blank forms and specifications can be had on application to this office. WM. P. CRAIGHILL,
Lt.-Col. of Engineers, U. S. A.

PROPOSALS FOR LABOR AND MATERIALS AT TOLEDO, OHIO.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEPARTMENT, WASHINGTON, D. C., *April* 25, 1883.

Sealed proposals will be received at this office until 12 m., on the 16th day of May, 1883, for all the labor and materials, bricks and mortar and setting stone required to complete the Custom House, etc., at *Toledo, Ohio*, in accordance with drawings and specifications, copies of which, and any additional information, may be had on application at this office or the office of the Superintendent.
JAS. G. HILL, *Supervising Architect.*

PROPOSALS FOR FUEL, FORAGE AND STRAW.

DEPOT QUARTERMASTER'S OFFICE, HOUSTON ST., COR. GREENE, NEW YORK CITY, *May* 1, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, on the 31st day of May, 1883, at which time and place they will be opened in presence of bidders, for furnishing and delivering Fuel, Forage and Straw required at *New York City, Willet's Point, N. Y. H.*, and *David's Island, N. Y. H.*, during the fiscal year ending June 30, 1884.
The Government reserves the right to reject any or all proposals, or to accept as may be most advantageous to the Department.
A preference will be given to articles of domestic production, conditions of price and quality being equal, and such preference will be given to articles of American production produced on the Pacific coast to the extent of the consumption required by the public service there.
Blank proposals and printed circulars stating the kind and estimated quantities required at each post, and giving full information as to the manner of bidding, conditions to be observed by bidders, and terms of contract and payment will be furnished on application to this office.
Envelopes containing proposals should be marked:—"Proposals for Fuel, Forage and Straw," and be addressed to the undersigned.
HENRY C. HODGES, *Lt.-Col. and D. Q. M Gen'l, U. S. A.*

NOTICE TO CONTRACTORS.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

THE "ECLIPSE"
Hand Pipe-Cutting Machine.

THE "ECLIPSE" HAND PIPE-CUTTING AND SCREWING MACHINE will be found a very convenient and efficient substitute for the heavy and costly Power-Machines usually employed to cut the larger sizes of Wrought Iron, Steam, Gas and Water Pipes.

While it is substantially built, and designed to work easily and without strain on any of the parts, it is at the same time very compact and portable.

It will cut off and thread 2½, 3, 3½ and 4 inch Pipes, and is so powerfully geared that a stout boy can easily cut and thread 4-inch Pipe with but a 12-inch Crank.

PIPE-FITTERS AND INDUSTRIAL ESTABLISHMENTS, who have occasion to cut Pipes within the range of the "ECLIPSE," will find it a most convenient and labor-saving tool, and as such we invite their attention to it.

We have in course of manufacture, and will soon place upon the market, another size "ECLIPSE" HAND PIPE-CUTTING MACHINE, *to cut pipes from ¼ to 2 ins. inclusive.* This machine will be very light, convenient, and in every way well adapted for Pipe Work of these sizes, and will be sold at a price within the reach of any one having use for such a tool.

Address, *PANCOAST & MAULE,*

Patent Water Closets

The Original and most Reliable SANITARY WATER CLOSET in the World.

200 Vine Street, Cincinnati, O.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),
17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS AND *BACK WATER TRAP*

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

READERS WILL CONFER A FAVOR BY MENTIONING THE SANITARY ENGINEER WHEN THEY COMMUNICATE WITH ADVERTISERS.

THE TUCKER GREASE TRAP.

THE necessity for the use of a grease trap under kitchen and butler's pantry sinks, is too well recognized by sanitary engineers and plumbers to require any argument. The frequent stoppage of drain pipes which receive the waste water from kitchens of hotels, restaurants and private houses where much dish washing is done, is well known to those who have suffered the annoyance, and been obliged to pay for the frequent removal of the clogging grease. Believing that the *Tucker Grease Trap* is the best device yet designed for that purpose, we have arranged with its inventor to manufacture and supply the trade with this useful appliance.

Mr. Tucker informs us that he has, among others, thus far fitted them up in the following buildings: Residence of Cornelius Vanderbilt, Esq., Residence of the late Robt. L. Stuart, Esq., Residence of Theo. Havemeyer, Esq., and Restaurant in the Mills Building.

The grease is retained in this Grease Trap in the following manner:

The waste water passes down the tube *K*, following the course shown by the arrow into the waste pipe *D*. The depth of the standing water is indicated by the line *L*. Cold water circulates in the jacket *M*. It enters from the cold water pipe *A* and passes out at *B*; this has the effect of chilling the grease in the compartment *N*. The grease being on top, naturally increases in depth until it occupies this space, when it prevents the water passing into the pipe *D*. This will be indicated by its failure to run off. The chamber *N* with the tube *K* can then be lifted out, and the cake of grease removed. The parts may then be put back and again used until it is necessary to repeat the operation.

This represents the form used under and attached to a kitchen or pantry sink.

This represents a form to set on the floor intended for sinks not specially constructed for this trap.

FIG. 4.

FIGURE 4. Shows the shell of the trap with the grease collector removed.

FIG. 5.

FIGURE 5. Shows the removable part of the grease collector.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

The above illustration represents the LONG OVAL FLUSHING RIM EARTHENWARE HOPPER with No. 2 Waste Preventing "After Wash" Cistern.

There is no simpler or more effective automatic Water Closet apparatus for use in public places.

The above illustration represents the SHORT FLUSHING RIM OVAL PORCELAIN HOPPER AND TRAP, with PATENT "DUPLEX" CISTERN, which is unequaled as a Waste-Preventing "Before and After Wash."

By above arrangement, ½ of a gallon of water is discharged as soon as seat is depressed, but no more water can be used until seat is relieved, when two gallons are discharged, thoroughly flushing and cleansing the Hopper.

We furnish above with any style of Hopper, Earthenware or Enameled Iron.

Illustrated Circulars, showing the various styles, with prices, sent on application.

All our Sanitary Specialties are fitted up with water attached, and may be seen at our Warerooms, 88 and 90 Beekman St

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

THE PRESIDENCY OF THE NEW YORK HEALTH BOARD.

The Mayor of this city last week nominated Prof. Charles F. Chandler for the position of Health Commissioner and President of the Health Board, which office he has held for ten years. This admirable nomination was promptly rejected by the Board of Aldermen by a vote of thirteen to ten, eleven of the majority being members of Tammany Hall, and two were so-called Republicans. This nomination gave satisfaction and gratification to those of our citizens who are interested in the sanitary welfare of the city, and dread the introduction of partisan politics in a department that under the circumstances has hitherto been kept remarkably free from its demoralizing influences.

From this statement of fact our readers outside of this city may deem this rejection inexplicable. For their information, therefore, we shall briefly explain the situation and the various causes said to have produced the result. As might be expected, an efficient health officer makes enemies, and these enemies in this instance are claiming credit for Prof. Chandler's rejection.

Among others, there are the class who have sold and want to sell skimmed and adulterated milk; others want to pile up manure to rot until is suits their convenience to remove it; others want to be permitted to drive cattle through our streets; others want to build and maintain wretchedly bad tenement houses, and others who manufacture vitrified tile pipe are annoyed because the Health Board, under Dr. Chandler's leadership, have deemed it to be their duty to prohibit its use inside the houses to be built in this city, for the very good reason that it is impracticable to insure its being so laid in this city as to prevent leakage and consequent pollution of the soil and air within the building.

All of these classes have sought legislation in behalf of their special interests. The public welfare demanded that their efforts should be thwarted, and Prof. Chandler never hesitated to oppose such measures, and, up to this time, with conspicuous success, consequently we have for some time heard boasts from persons claiming to speak for these interests that he would not be permitted to serve again as Health Commissioner, and these people no doubt take considerable credit to themselves for his rejection. We, however, are not disposed to attribute the action of the Board of Aldermen to their influence, nor do we consider that his creditable record in this respect has cost him his place.

It is due to the desire of the local political leaders to have a man as president of the Health Board who would be of some use to some political organization; in other words, as a prominent member of Tammany Hall said: "as that is a sixty-five hundred dollar office for six years, I suppose our people think some of our own men should have it" (the salary, by the way, is now $5,000); consequently the eleven votes controlled by that organization, and two controlled by a man who uses them to make terms with those who need them on a close contest, decided the issue last Wednesday. As we write, many of our best citizens are working to induce the leaders we have referred to, to permit this office at least to go to a man who does not need it, but whose special training, long experience and executive ability, peculiarly fit him for the proper performance of the responsible duties it imposes, and there is a bare possibility that the vote of last week may be reconsidered, and Prof. Chandler yet be confirmed. When we consider the great discretionary power vested in our New York City Board of Health—powers placed there because of the confidence in the ability and integrity of its active members, we cannot but view with deep concern the possibilities involved in a change in its presidency.

THE RAMAPO SCHEME.

Some of the questions of hydraulic engineering involved in the project for bringing the Ramapo water to New York, are discussed by *Engineering News* in its last issue, at considerable length and in a manner displaying a thorough acquaintance with the principles at issue and the peculiarities of the scheme which has been advocated. The discussion is timely, and is of interest, as illustrating very forcibly the ground we have taken, that the Ramapo scheme was not sustained by impartial evidence, but was put forward on insufficient and one-sided arguments.

The point particularly dwelt upon by *Engineering News*, is the insufficiency of the proposed reservoirs to furnish permanently the quantity of water which the bill now in the Governor's hands requires to be guaranteed.

It is shown that the assumptions of the Ramapo engineers, regarding the probable rainfall, are not based on the observed facts, nor even on sound theory, and that even with the most liberal allowance, the storage capacity proposed to be furnished by the embryo company, while it may suffice for average years, will unquestionably fail in a year of minimum rainfall. To insure a daily supply of 50,000,000 gallons, from 85 square miles, will require very much greater storage capacity than can be furnished for the money proposed to be expended.

Digitized by Google

Regarding a supply of water for fires, the writer makes a suggestion which strikes us as eminently practical. It is, that instead of gathering "the water from a score or more of reservoirs in Rockland County, with all their automatic contrivances under private management, and bringing it in four lines of pipes under the Hudson River and selling it to the city," a line of pipe be laid to the Boyd's Corners reservoir, in the Croton Valley, which is 41 miles from the city, and 600 feet above it. This is a simpler, cheaper and more effective method of getting a fire pressure than the complicated Ramapo scheme, with its contingencies of lawsuits and possible entire failure.

We are glad to see this subject, of so great importance to this city, treated on its merits as a scientific and practical problem by our contemporary, and we venture the opinion that if any money is ever furnished to carry out this Ramapo project, it will be because some speculators believe that they can construct their plant from plans of their own, without interference from outsiders, and just durable enough to hold water till they can sell it to the city. To our mind, few schemes within late years suggest greater possibilities for fraud and rascality.

The American Steam Heat and Power Company has, on the application of its bondholders, been placed in the hands of a receiver. It is stated that most, if not all, of the money thus far expended is from the sale of bonds, the stock being largely held by politicians and others who secured the franchise, and who have paid nothing for it. The bondholders, therefore, are unwilling to put up any more money to be spent as hitherto. We learn that if these stockholders can be got rid of, it is proposed to furnish more money and try it again, a prospect, in view of our past experience in this city, not pleasant to contemplate.

DIPHTHERIA AND MILK SUPPLY.

Under date of February 1, 1883, Dr. H. F. Parsons has presented to the Local Government Board of England a report on an outbreak of diphtheria at Devonport in November and December last. The outbreak was not an extensive one, 18 households having been affected, the number of cases being 31 and of deaths five. The families attacked were those of professional men and of officers of the army and navy. No case occurred among the large working-class population.

Dr. Parsons was unable to find anything peculiar in the sanitary condition of the houses to account for the occurrence of the disease, nor, except in a few instances, was there exposure to infection from a previous case.

It had been observed that the greater number of the persons affected had obtained their milk supply from a particular dairy, and special investigation was made on this point. Dr. Parsons' conclusions are as follows:

"1. Although it cannot be affirmed with any degree of certainty that there was any casual connection between the outbreak of diphtheria and the particular dairy, yet the limitation of the disease to the consumers of the milk indicates that this was probably the case.

"2. The small proportion of the customers attacked shows that any contamination of the milk by infective material could have been only partial and occasional in its occurrence.

"3. The cause of the diphtheria—if the infection were conveyed by milk—may have been some condition existing at the milk-shop premises or at the farm.

"4. On the milk hypothesis, the milk must have first received infection about the beginning of December. The child in the adjoining house may have received infection from the same source, or from the milk itself, which she was in the habit of drinking.

"5. The increased prevalence of the disease in the latter part of December—18 out of 32 cases having commenced between December 21 and 30 inclusive—may be due to infective matter reaching the milk in larger quantity from the case of diphtheria in the house adjoining the milk shop.

"6. It may be suggested whether the infective matter may have gained access to the milk by the wiping out of the cans with cloths which had been hung up in the narrow, close back-yard, and had contracted impurities from the atmosphere.

"No connection was apparent between the amount of milk consumed and the occurrence of diphtheria. Some, indeed, of the persons attacked were stated to be large milk drinkers, but others again took it only in small quantities in tea or coffee. The large proportion (20 out of 31) of cases among persons above the age of childhood is unusual, and its explanation on the milk hypothesis is difficult."

THE DISPOSAL OF SEWAGE BY SUB-SURFACE IRRIGATION IN SUB-URBAN RESIDENCES.

By Edward S. Philbrick, C. E.

(Continued from page 531.)

If an attendant looks at the lower end of the syphon every few days and cleans out the notch or small syphon as often as choked, it will resume operations; but such attention is annoying and is not expected to be supplied to an apparatus claimed to be "automatic."

If the volume of sewage is large, such as would flow from a combination of several houses, the whole apparatus is on a large scale, and the small syphons or notches would be so forcibly flushed by the periodic flow, that they are not so likely to become choked as when small pipes are used for a smaller volume of sewage.

After trying experiments with results as above described for a year or more, the writer had recourse to a different form of the apparatus, and succeeded in overcoming the difficulties above described to a very large extent, if not entirely.

Whether or not this modification is subject to Mr. Field's patent is perhaps a question which it is left for others to determine. The apparatus as thus modified, has now been in public use so long that no one can procure a valid patent upon the improvement, and it is therefore presented to the public for what they think it worth, subject to Mr. Field's patent if found to be so. Instead of cutting a V-shaped notch in the edge of the cup at the lower end of the syphon, or using a small syphon to discharge the cup, it is proposed to abandon the cup, making instead a channel in the direction intended for the outlet, and contract the sides of this channel at a point about a foot from the end of the syphon, so that they shall obstruct the flow and raise the level of the water to such a height as to seal the end of the syphon whenever a slight flow begins. Since this narrowing of the sides is made very gradual by smooth flowing curved lines, and the sides are formed of cement, troweled smoothly and carefully, and expanding again below in the same manner, the channel is found to keep itself clear of rubbish, and needs no attention to keep it free. In the annexed diagrams sectional views are given of this channel, which will serve to explain this description.

If the syphon were to be applied directly as an outlet for the tank which receives the sewage from the house, it would soon get choked by the scum which collects on the surface, or by the sediment which collects on the bottom. It is, therefore, found best to construct a second tank between the first, which I call the "settling basin" on the plan, and the syphon itself. The second is called the "flush tank," for it is alternately filled and discharged, while the first one always remains full. The inlet drain should dip some eight inches below the water line, as shown, with a hand-hole at the top (at *A* on the section), covered with a cap, fitted into the hub, and some sand on it to prevent the foul air from following up the drain from the tank to the house. The vent hole outside for the inlet drain operates as a foot vent for the house drain, if the apparatus is near the house, and is not likely to give offense, for the draft is almost always inward at this point, passing up through the house drain. This settling tank being always full of

Digitized by Google

FLUSH TANK AND ABSORPTION TILE AS APPLIED TO THE DRAINAGE OF THE BRYN MAWR HOTEL (450 GUESTS), NEAR PHILADELPHIA.

Digitized by Google

putrefying mass, should be made perfectly tight, and should be ventilated by an air hole as shown. This vent should be extended to a suitable place on the roof of a barn, stable or house, or up a large tree, where its gases will not give offense.

The connection between the settling tank and the flush tank should be by iron pipes built into the walls as shown, so that air can pass freely from one tank to the other at all times, and so that the overflow of the settling tank may not be from the surface or scum, nor from the bottom, but from a point about a foot below the surface.

Syphons are often constructed inside of the flush tank, but as it is best to have such apparatus easy of access at all times, a better way is to put the syphon outside, as here shown, and make a separate man-hole for getting access to it, whether the tank be full or empty. The syphon can be built of soil pipe, put together with lead.

It is found that a two-inch syphon is large enough for a single house or family. If made larger, it would require a more copious flow to start it than a single family might often give.

But in order to avoid friction, and thus give as rapid a discharge as possible, after it gets in action, the rising limb of the syphon is preferably made of four-inch pipe, with a reducer and a two-inch return bend at the top. Since the reducer might sometimes get choked with lumps of solid matter, it is always best to put a clearing screw at the top in the return bend. If made of thick casting, it can be tapped for the purpose, though a better way is to clamp a brass plate or saddle on top to receive the screw and make a red lead joint between saddle and pipe. The syphon is held in its place firmly by projecting brick as brackets while building the wall on either side of it, and similar projecting brick should be left in all the tanks as steps to be used in getting in or out for inspection. The interior of both the tanks should be plastered, and washed with hydraulic cement as high as the water line, and the iron pipes well bedded in cement mortar to make all tight and firm around them. These pipes should also be supported by stirrup irons built into the brick work as shown.

In order to make the syphon work well some care must be used in adjusting the level of its delivery above the bottom of the channel which drains it. The portion of the channel under the outlet of the syphon should be, for a 2-inch pipe, at least 2½ inches deep below the end of the pipe, and the bottom of the draining channel where narrowed up should be from ¼ to ½ an inch below the end of the pipe. This narrow part of the channel should not be wider than ⅜ of an inch at the bottom, smoothly formed, as shown in the section. If any rubbish should ever gather in it, a broom worked through the man-hole above would easily remove it.

The outlet pipe from this apparatus should be four or five inch stoneware pipe for a 2-inch syphon. If over a hundred feet in length, and without a good inclination, say not over two feet in a hundred, the lager size is preferable.

The distributing pipes should be cylindrical, one foot in length, and two inches bore. The quantity needed varies somewhat with the porosity of the soil, and the size of the flush tank. The flush tank here shown contains 37.76 cubic feet, when filled. The pipe should be of sufficient length to contain about one-half this amount, say 19 cubic feet. Since the sectional area of 2-inch pipe is 3.14 square inches, it will require about 46 lineal feet of the pipe to contain a cubic foot. There should, therefore, be about 46 times 19, or 874 feet in length. If the soil is extremely porous, a smaller quantity would doubtless answer the purpose, since a larger proportion of the water would soak away while the syphon is discharging the tank.

These distributing pipes should be laid with a perfectly uniform slope of about six or eight inches in one hundred feet. If the slope exceeds this, the water may burst up at the lower end. They should not be covered more than eight inches in the clear below the surface of the ground. In order to combine these two conditions, the ground must be somewhat smoothly graded, and the lines for the trenches must be laid out so as to conform to the contour of the surface, *i. e.*, the lines of the trenches must follow nearly on contour lines, or lines which have a surface slope limited as above stated. The trenches may be at intervals of five or six feet, dividing the field in a gridiron fashion. If the lines are only one or two hundred feet in length, the width of the plot will be from forty to twenty feet to use eight hundred feet of pipe.

The branches where the 2-inch pipes leave the main drain should be so constructed as to allow the sewage to flow out from the bottom of the main into the branch, as shown in annexed section (A). They can be made rights and lefts, to suit the places where used, and can be either of the T or Y form. Ordinary branches are intended for combining two streams into one, but those are for dividing one stream into two. They should therefore be formed as shown in annexed drawings, having no hub on the small hole or branch, which simply abuts against the first 2-inch pipe, in the same way as the 2-inch pipes abut against one another.

The small porous pipes have sometimes been laid upon boards bedded in the trench to secure a more uniform gradient and prevent dislocation of joints, but as the boards soon go to decay and allow the pipe to be badly dislocated by settlement, it is better to provide terra cotta troughs to lay under the joints; each piece being a foot long and four inches wide outside, shaped to conform to the outsides of the cylinders, placing one piece under each joint with the hollow side upwards. Similar pieces about four inches long should be placed over the joints as covers, as shown in annexed drawings (B), to keep the sand out.

PERSPECTIVE VIEW OF UNGLAZED 2 IN. TILES WITH TROUGHS AND COVERS.

Of course, the plot selected for the distribution must be under-drained, either by nature or otherwise. Artificial drainage may be needed if the soil is likely to be saturated with water for any considerable time, *i. e.*, over one day or so at a time after heavy rains or during the rainy season.

The joints of the distributing pipe should be laid at least ¼-inch open. If laid closer they have been found to fill up with the solid particles of the sewage, and obstruct the soakage. Of course care should be taken not to disturb the position of the pipes in filling the trench. The lower end of the main should turn up into the air, to allow air to escape when the water rushes in. If this is in a place likely to give offense, it should be removed to a suitable place where free vent can be obtained without trouble.

It is often hard to convince workmen in our northern climate that the pipes should not be buried over eight inches. But if buried deeper the roots of the grass and the air do not get ready access to the sewage, and it is therefore disposed to accumulate, a result which we wish to avoid. Where laid near the surface no accumulation is found to take place, and the frequent flow of warm water from the house prevents the ground from freezing under and around the pipes if covered with sod.

BAD PLUMBING.

NEW YORK, *April* 27, 1883.

To the Editor of THE SANITARY ENGINEER:

In the house of a well-to-do Brooklyn resident, where I recently spent a night, my attention was drawn to an interesting little feature of the plumbing which I had never noticed before. Hearing a gurgling sound in the bathroom connected with my chamber whenever I heard water drawn in an adjoining room, I opened the door concealing the pipes under the basin and quickly saw the cause. The S-trap on the waste pipe had been pulled apart or stretched—probably to increase its length and save so much pipe—so that a seal of only about half an inch was left. Since there was no air pipe attached to the trap, and the waste pipe probably not extended to the discharge of a basin in an adjoining room into the same waste pipe, was quite enough to pull out nine tenths of the water the defective trap contained.

Very respectfully, your obedient servant,

[illegible]

E. G. LOVE, Ph.D., *Gas Examiner.*

ESTIMATION OF HYDROGEN SULPHIDE AND CARBONIC ANHYDRIDE IN COAL GAS.

The *Chemical News* gives the following abstract of a paper on the above mentioned subject, read at a recent meeting of the Chemical Society, by Mr. L. T. Wright:

In the analysis of crude coal gas by absorbtiometric methods—as in Bunsen's, etc.—it is usual to term that portion of the gas which is absorbed by manganic peroxide, ferric oxide, etc., hydrogen sulphide; whilst that portion which is absorbed by caustic potash, and not by manganic peroxide, is usually designated carbonic anhydride. The author first gives some results obtained by absorption with a bullet of manganese peroxide and with KHO solution in a Frankland and Ward apparatus. Higher results were always obtained when the gases were absorbed successively than when they were absorbed simultaneously by using a solution of KHO. This difference between the results was considerably diminished by submitting the manganese bullet to a current of clean coal gas before using it for absorption. The author prefers the following method. The crude coal gas, dried and freed from ammonia by passing through phosphoric acid, is passed through two weighed U-tubes, the first charged with roughly powdered cupric phosphate in one leg and calcium chloride in the other, the second containing soda-lime (slightly moistened by exposure to the air for about 18 hours) and calcium chloride. The increase of weight in the first gives the sulphuretted hydrogen, in the second carbonic anhydride. The copper phosphate is prepared thus: Two pounds of ordinary phosphate of soda are dissolved in one gallon of water, and two and one-half of cupric sulphate in one and one-half gallons of water. The two solutions are vigorously stirred together, the precipitate washed by decantation, and dried at 100° C. Cupric phosphate thus prepared absorbs hydrogen sulphide very perfectly. Before

Digitized by Google

using the absorption tubes, three cubic feet of clean, dry coal gas are passed through to "saturate" the re-agents. The gas during the absorption should be passed at the rate of quarter to half a cubic foot per hour. The total quantity must vary with the impurity of the gas. The sum of the hydrogen sulphide and carbonic anhydride thus estimated is always greater than the number obtained by absorbing these gases simultaneously in one U-tube charged with soda-lime. A six-inch U-tube charged with cupric phosphate will absorb 20 grains of hydrogen sulphide. A similar sized U-tube charged with soda-lime will absorb perfectly 18 grains of carbonic anhydride.

Dr. Armstrong suggested that some acetylen might be absorbed by the cupric phosphate.

The President asked if bisulphide of carbon vapor was absorbed by soda-lime.

Mr. Wright said that he did not think that the gain of weight was due to the absorption of acetylen, and in answer to the president, said that bisulphide of carbon was not absorbed by ordinary soda-lime from gas previously freed from hydrogen sulphide.

ELECTRIC LIGHT NOTES.

Quebec will soon be illuminated with electric lights.

Hell Gate is to have an electric light of 20,000 candle power.

Forty-two light-houses on the French coast are furnished with electric lights.

The Philadelphia papers are urging the lighting of Fairmount Park with electric lights.

The Light House Board will make experiments with the electric light, with a view of determining the value of the various kinds for light-house purposes.

The factory of the Bridgeport Organ Co. has 400 electric lights. These are run by the power disengaged after the stoppage of the heavier machinery at dusk, and are said to be cheaper than gas.

The action of the Commissioner of Patents in awarding the priority of invention for improvement in electric lighting to Moses G. Farmer, as against Starr and Peyton, has been affirmed by the Secretary of the Interior.

An electric light for deep-sea fishing adorns the new steamer Albatross, of the Fish Commission. When sunk beneath the water it attracts the fishes, and these are caught by a net which is drawn up from beneath it.

The Duke of Teck recently presented the prizes that were awarded to exhibitors in the International Electric Exhibition of 1882. This year the exhibition will be principally devoted to the consideration of gas in its application to domestic purposes.

The Volta prize of $6,000 will be awarded by the Academy of Sciences, Paris, in December, 1887, under the decree of June 11, 1882, for the discovery or invention of whatever shall render electricity applicable economically to one of the following objects: Heat, light, chemical action, mechanical force, the transmission of messages, or the treatment of sick persons.

Meter-ites.

The capital stock of the Cincinnati Gas-light and Coke Company has been increased from $4,250,000 to $5,000,000.

The report of the Bureau of Statistics of the Treasury Department for March shows that the export of petroleum and petroleum products for that month amounted to 36,309,101 gallons and $3,423,136, against 40,377,458 gallons and $3,753,706 for the corresponding month of 1882.

The following resolution has been introduced in the Brooklyn Board of Aldermen: "That the Commissioner of the Department of City Works be directed to cause the gas furnished to this city to be tested as to its illuminating power, in not less than fifteen different parts of this city, and transmit to this Board at its next meeting the result of said testing."

It has been decided to light up Port Said by compressed gas upon Pintsch's system. It is intended to have three fixed lights, each capable of burning two months without replenishing, and eight floating buoys, nine feet in diameter, which will also burn for two months without recharging with gas. There will also be three large holders for storing the gas under pressure and for filling the buoys.

At the annual dinner of the officials, Mr. Robertson, superintendent of the pipe-laying branch of the Gas Department of the Glasgow Corporation, gave some figures as to the supply of the city. Gas was first supplied to the public of Glasgow in 1818, but the meter system was not introduced till 1827, when the total manufacture was seventy-nine million cubic feet. When the undertaking came into the hands of the Corporation, the total production was 1,295,000,000 cubic feet, whereas last year it was 2,056,000,000 feet. The loss by leakage had been as steadily reduced year by year. In 1870 the loss of gas was twenty-two per cent. of the whole make, falling to twenty-one per cent. in 1872, to nineteen per cent. in 1874, to fifteen per cent. in 1880, to fourteen per cent. in 1881, while last year it was reduced to twelve per cent.

John K. Fisher, for many years Superintendent of the Service Department of the New York Gas Light Company, died on Saturday the 12th inst.

Correspondence.

RESPONSIBILITY OF A LANDLORD FOR THE RESULTS OF BAD PLUMBING.

CHICAGO, ILL., *April* 23, 1883.

To the Editor of THE SANITARY ENGINEER:

In a form of lease in use by the "Real Estate and Renting Agents' Association," of this city, the following is one of the articles of agreement between the landlord (the "party of the first part") and the tenant (the "party of the second part"):

"That the party of the first part shall not be liable for any damage occasioned by failure to keep said premises in repair, and shall not be liable for any damage done or occasioned by or from plumbing, water, gas, steam, or other pipes, or sewerage, or the bursting, leaking or running of any cistern, tank, wash-stand, water-closet or waste pipe in, above, upon or about said building or premises, or for any damage occasioned by water, snow or ice being upon or coming through the roof, sky-light, trap-door or otherwise; nor shall first party be liable for any acts or neglects of co-tenants or other occupants of the same building or of any owners or occupants of adjacent or contiguous property; and that....he....said second party will, without injury to the roof, remove the snow and ice from the same when necessary, and clean snow and ice from sidewalks in front of said premises."

Now, will this be binding in law? Supposing sickness or death be the "damage" occasioned by or from plumbing, might not the landlord be held liable for the results, even if the tenant had signed this agreement? The poor are to a great extent at the mercy of tenement house owners, and are almost forced to sign whatever terms an exacting and hard-hearted property owner may devise.

Respectfully, A HOUSE HUNTER.

[This form of lease, however objectionable it may be to the tenant, is undoubtedly binding. Primarily it is the duty of the tenant during his term to make repairs, and not of the landlord, as is commonly supposed. Hence, if the tenant sustain damage because of defective water pipes, roof, etc., it is attributable to his own neglect in suffering them to get "out of repair," and the landlord is not liable.

The rule, however, is somewhat different as to tenement houses. In these the landlord retains possession of the general sanitary appliances for the use of all the tenants, and since it would be impracticable for one tenant to make the repairs, which would benefit himself no more than all the other tenants, this duty is imposed upon the landlord, and his failure to make needed repairs would render him liable in damages for any injury sustained by a tenant in consequence of this neglect.

The right to claim damages from the landlord under such circumstances, the tenant may, however, by a stipulation, such as is inserted in the Chicago lease, agree not to enforce.

The terms of a lease are entirely matters of agreement. At times landlords are masters of the situation, and again the tenants hold the advantage, and secure leases upon terms more favorable to themselves.]

HEATING BY HOT WATER.

COLUMBUS, OHIO, *May* 1, 1883.

To the Editor of THE SANITARY ENGINEER:

In your issue of May 4, 1882, you published, with diagram, an article by me on Hot Water Heating for Private Houses, in which I detailed my own apparatus. You offered two criticisms of my apparatus, to which I now, after another winter's experience, am able to reply: (1.) After first filling the apparatus with water, the air *did* accumulate at *E*, in second story return bend, on starting the fire; but after opening the cock and letting this air out, there was no further accumulation, and can be none, as no more air can get into the water. (2.) As to the "miniature geyser" in the supply tank: Once during the winter, when the fire got unusually hot, steam formed somewhat rapidly, and produced a rumbling by blowing off under the water in the tank. Shutting the damper stopped this in less than a minute, and the experience was not repeated.

Indeed, a second winter's experience with my hot water heating finds me as well pleased with it as before, so that I would not now change any of the expressions of satisfaction which I used in the article alluded to.

Very truly yours, J. F. BALDWIN, M.D.

LAYING STONEWARE DRAINS.

To the Editor of THE SANITARY ENGINEER:

Laying a tile drain on soft ground, or newly filled land, is there any way a good foundation can be secured? Would it do to lay down 2-inch pine or cedar planks after the bottom of the trench is made to a true grade, putting a block under each pipe at the collar, and then filling under the pipe with cement?

Can the plan adopted by Col. Waring at Memphis, of putting the pipes on top of piles cut out to receive them, be applied to advantage?

[The method proposed, like all other methods, will fail to prevent the pipe from settlement whenever the material settles by which it is surrounded, as is generally the case in recently filled ground. Such settling does not occur

from the weight of the pipe itself, which is trifling, and no greater than the bulk of the earth which it displaces. The trouble arises from the slow and continued consolidation and settling of the whole mass.

Driving pile-bearings, as recommended by Col. Waring, would also be useless, unless driven *through* the filled material to a firm bottom, which is often impracticable.

But in ground which is merely *soft*, and not recently filled, the case is very different. All that is needed in that case is a platform as suggested, to avoid disturbing the pipe during the process of putting them together and filling in the trench. But unless the ground is permanently wet at all times of the year, the plank will decay, and when that happens the whole drain will be broken up by its unequal settlement. A better plan in ground that is sometimes dry, is to dry it by temporary drainage or pumping, and then pursue ordinary methods.]

GALTON FIRE-PLACE.

PHELPS, N. Y., *May* 4, 1883.

To the Editor of THE SANITARY ENGINEER:

Your correspondent, F. F. C., will find description of Capt. Galton's Ventilating Fire-place, at page 298, of Smithsonian report, for 1873. Arthur Morin's paper on Warming and Ventilation, a translation of which appears there, contains information of great value. G. W. R.

POLLUTION OF CELLAR FLOOR.

BROOKLYN, *April* 18, 1883.

To the Editor of THE SANITARY ENGINEER:

Last winter the water pipes and the soil pipe in my house in Brooklyn burst, and after some days we accidently discovered that water closet filth had leaked down and saturated a large place in the cellar bottom, which is simply the natural soil, not cemented, nor even floored over. Now that warm weather is coming on, I am afraid of consequences and think of moving out. I have taken dry clean earth and spread over the saturated place, and that has seemed to purify the air. Is there anything else to be done? Are there any disinfecting substances which can be tried with success, or must the cellar be dug out? I may say that the landlord of this house will do nothing if not compelled to. It was only when the plumber whom he hired refused to patch up the pipe and insisted on putting in a new one, that he would have it done. J. W.

[We should remove the foul earth and replace with new.]

A CORRECTION.

BOSTON, MASS., *May* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

In your issue of May 3, 1883, on page 512, Mr. Hall's figures in tables V. and VI. should be given as "grams" not as "grains." W. R. N.

DR. CHANDLER AND THE NEW YORK HEALTH DEPARTMENT.

The aldermen having rejected the mayor's recent nomination of Dr. Chandler for a third term as President of the Health Department, and an effort having been inaugurated to induce them to reconsider their action, THE SANITARY ENGINEER has deemed it of interest to its readers to present a brief outline of the more important services which this department has rendered during the few years of its existence.

In 1866, Prof. Charles F. Chandler was invited by Dr. Harris, of the Metropolitan Board of Health, to make scientific studies of sanitary questions affecting the health of this city. There was no appropriation for the purpose and the work was performed gratuitously. The commissioners were so well satisfied of the importance of the work that at the end of the year they created the position of chemist to the Board of Health for Dr. Chandler, a position which he held until 1873, when he was appointed President of the Board of Health, by Mayor Havemeyer. In 1877, Mayor Ely re-appointed him, and his second term expired the first of May of the current year.

Among the subjects to which Dr. Chandler devoted special attention while chemist to the Board of Health were: the food and water supply of the city, adulteration of liquors, poisonous cosmetics, kerosene accidents, and the gas nuisances.

MILK SUPPLY.—Numerous analyses of the milk sold in the City of New York have established the fact that this important article was shamefully adulterated, and that on the average at least 33 per cent. of water was added to the original milk, while a considerable part of the cream was often removed. It was also found that most of the condensed milk companies skimmed the milk before concentrating it. The total frauds of milk-men amounted to about $10,000 per day. The Metropolitan Board did not attempt to grapple with this evil, but as soon as Dr. Chandler was made president he initiated a successful warfare upon dishonest dealers, assuming that as milk was the chief diet of the 130,000 children in New York under five years of age, it was the most important article for sanitary supervision. The milk dealers organized an association, and secured legal and chemical assistance, attacking both the law and the chemical methods employed. After several test cases had developed all the facts the Court of Appeals affirmed the laws, and the best chemists in the country indorsed the methods. About $40,000 has been paid into the city treasury as fines by offending milk-men, and quite a number of them have spent from ten to ninety days in prison.

KEROSENE ACCIDENTS.—One of the most successful investigations was that of kerosene accidents, which were of very frequent occurrence wherever this oil was used. As it was of recent introduction, very little was generally known of its chemical nature, and it was supposed that the accidents were unavoidable, and were due to peculiar and inherent properties of the oil. Kerosene came in as a substitute for camphene or burning fluid, which was inherently dangerous, and could not be made safe. Kerosene was supposed to be similar to camphene in constitution and properties, and the accidents were generally attributed to carelessness.

In 1869 Dr. Chandler began to investigate and write upon this subject. His first report, dated January 11 of that year, was a simple statement of the chemical nature of petroleum, and its mode of manufacture, and pointed out the fact that its dangerous character was entirely due to a small percentage of inflammable naphtha left in by the refiner to save a trifling percentage of profit. It also contained the statement that of 78 samples of oil purchased from retail dealers in New York City, not a single one was safe, while many were pure naphtha sold under the name of "safety oil." This paper was extensively reprinted and was made the basis of legislative action in various parts of the world. A fuller statement of the subject was published in July of the same year, a third paper in 1870, and a very elaborate report in 1871. These papers were reprinted in whole, or in part, in England, France, Germany, and Switzerland, and Dr. Chandler was invited in 1872 to appear before the select committee of the House of Lords, in connection with this subject.

GAS NUISANCES.—For years a most intolerable odor prevailed over large areas of the city, at one time on the east side, at another time on the west side. The odor was generally attributed to the sewers. When it was clearly established that it came from the gas works the companies were appealed to, and with one exception they modified their processes so as to suppress the odor, the immediate cause of which was found in the foul lime which was daily removed from the purifiers. One of the companies declined to pay any attention to the suggestions of the board, claiming that it did not produce any odor; that the odor was not disagreeable; that it was good for whooping cough; that its production was inevitable; and that if the company did not produce the odor the gas would be so impure that it would not be safe to burn it in dwellings. The company, therefore, joined issue with the Board, and a long trial before a referee was the result. The gas company attempted to sustain its assertions by the aid of gas engineers and chemists, but the board successfully combated them, and a decision was given against the company. The necessary changes were made and the gas nuisance ceased. The evidence taken in the case was published in the report of the Board for 1869.

THE NEW BOARD OF HEALTH.

Under the charter of 1873, the present Board of Health was organized, and it has now been in existance for ten years. The Board consists of four members, viz., the Health Officer of the Port, the President of the Board of Police, and two Health Commissioners, one of whom is a practicing physician. There have been since the organization in 1873, two Health Officers of the Port, Dr. S. O. Vanderpoel, and Dr. William M. Smith; five gentlemen have filled the office of President of the Board of Police in this period, Henry Smith, Hugh Gardner, George W. Matsell, Gen'l Wm. F. Smith, and Stephen B. French. There have been three medical commissioners of health, Dr. Stephen Smith, Dr. Edward G. Janeway, and Dr. Woolsey Johnson. Dr. Chandler has held the other Health Commissionership during the entire period.

These men, says Dr. Chandler, have always worked together in entire harmony, and it is a noticeable fact, that there has never been a disagreeable word spoken by one of them in the entire ten years and a negative opposition vote has never been recorded, with a single exception.

The efficiency and success of the present Board has been largely due to its good fortune and good judgment in securing its faithful corps of officers, sanitary inspectors, engineers, etc.

Col. Emmons Clark, the Secretary; Col. W. P. Prentice, the Attorney and Counsel; Dr. W. De F. Day, the Sanitary Superintendent; Dr. Edward H. Janes, the Assistant Sanitary Superintendent; Dr. James B. Taylor, the Chief of the Vaccinating Corps, and most of the sanitary inspectors, have been with the Board ever since its organization in 1873, and its success in grappling with the causes of disease has been largely due to their ability and activity.

In the selection of clerks and other subordinates, a civil service system, with examinations, was adopted, and every appointee has been made to understand that as long as he faithfully performed his duties he would be secure in his position. The effect of this system on the *morale* of the department has been of great value.

STENCH NUISANCES.—As soon as the board was organized, it began active warfare upon the stench nuisances, which made the air of the city at times intolerable. The first attack was upon the New York Rendering Company, which had a contract with the city for the removal of offal and dead animals beyond the city limits; instead of complying with the terms of the contract, the offensive material was rendered at the foot of West 38th street. The company was directed to at once stop rendering, and carry the material from the city. At first they claimed this was impossible. But when policemen were placed on the dock, with orders to arrest the workmen if they attempted to continue the work, the company placed the material on a vessel, carried it down the bay, and threw it overboard. As most of it floated ashore, it became the cause of equal offense in new localities. As the company insisted it must either "render or dump," the Board declared the contract violated, and made arrangements with different parties to carry all the material to Barren Island. The arrangements have been in force ever since, with entire satisfaction.

The Rendering Company, still retaining possession of the dock at the foot of 38th street, placed every obstacle in the way of the new contractors, and it became necessary to seize all their movable property, put it upon their two hulks which had been tied to the pier and tow them over to the New Jersey shore. This resulted in a suit for over $100,000, in which the board was successful.

The next attack was upon the vessel Algonquin, which lay at the foot of 39th street, and on which offal from slaughter houses were rendered. Orders was issued requiring the owners to discontinue the business; they resisted and finally moved out into the stream and carried on the work out of reach of the inspectors. The first encounter was a night attack upon the trucks engaged in carrying the offal to the end of the pier for delivery to the vessel. This failing to put a stop to the business, a steam tug was employed, and the Algonquin towed to Barren Island and tied up; the business now came to an end. A gut cleaning establishment at the foot of West 39th street next received attention, and the Board finally sent a gang of laborers and tore down the building and burnt the materials. The melting and lard rendering were sharply followed up, until every establishment engaged in the business was either suppressed or compelled to introduce improved machinery by which the business was rendered inoffensive.

SLAUGHTER HOUSES AND CATTLE DRIVING.—Originally the slaughter houses were scattered all over the city. The Metropolitan Board of Health moved them all up town, but, unfortunately, permitted them to settle in localities which in a few years became so extensively occupied by dwelling houses that the old evils again appeared. The new Board undertook a radical reform in the whole business. It began to encourage the building of a few large abattoirs, to take the place of the 52 slaughter houses on the island. The Cortland Palmer estate converted Manhattan Market, at the foot of West 34th street, into a well appointed abattoir. A company was organized to build a second abattoir at the foot of West 59th street, near the cattle yards, and on the East side the owners of slaughter houses had been brought to the point of arranging to construct an abattoir at the foot of 43d or 44th street, for their joint use. The scheme seemed to be on the point of consummation when a most unexpected opposition arose on the part of the managers of the Roosevelt Hospital and certain real estate owners west of Central Park. As the intentions of the Board were not fully understood by the public and the press, the opposition became so decided that the capitalists who proposed to erect the abattoirs were deterred from making the necessary investment. This plan which would have resulted in placing the whole business of slaughtering animals for food, the handling of the fat, blood and offal, in large establishments, with the best machinery, and at the same time would have made it possible for the health authorities to inspect every animal before it was killed, had to be abandoned. The Board then turned its attention to improving the present system, as far as practicable, and the badly constructed and imperfectly drained slaughter houses were condemned, as well as those situated in the immediate neighborhood of tenement houses. At present the business is restricted to a few blocks on the East River, east of First avenue, and to a few blocks on the Hudson River, to the west of Eleventh avenue, and is conducted with as little offense as practicable.

For a time the driving of cattle across the city was permitted, but the citizens protested so loudly against the annoyance and danger resulting from it that the Board was compelled to forbid it. For the last two or three years the cattle have been transported in boats, but during the past winter the west side slaughter houses have succeeded in securing the enactment of a law to permit them to drive cattle on Eleventh avenue, notwithstanding the protest of the Board of Health.

For years it was customary to allow the blood from the slaughter houses to run in the street gutters, through the sewers and into the rivers. This was forbidden by the Board of Health, and at its suggestion drying machines were introduced, by which the fresh blood is converted, without offense, into a dry powder, which is very valuable as a fertilizer.

STABLE MANURE.—It had been customary for years to accumulate stable manure at the foot of West 38th street and at the foot of East 45th and 90th streets. Huge piles of this material were stored at these points, soaked with water when it rained, and under the rays of the sun fermented and putrefied. The owners caused the piles to be turned over from time to time to prevent burning. Months were required to get it into proper condition for sale to farmers in the spring. The stench emitted was often intolerable. No subject has given the Board more trouble than this. When the Board refused to permit the storing of the manure, the contractors refused to take it from the stables, and the nuisance was transferred to thousands of

Digitized by Google

localities throughout the city. Finally, after years of litigation, the Board succeeded in making arrangements by which it was no longer necessary to permit the material to be stored in the city limits. During the past winter a law passed both branches of the State Legislature and is now in the Governor's hands, by which the Board of Health will be prevented from interfering with the storing of this material within the city.

NIGHT SOIL CONTRACT.—When the Board came into existence it found very inadequate arrangements for the removal of night soil. A contract had been made by which the city, for the sum of $4,000 per annum, agreed to deliver all the night soil collected by scavengers from the 28,000 privy vaults of the tenement houses to the Lodi Works on the Hackensack River. The parties interested in these works secured the contract for carrying the material to the Hackensack at a cost to the city of $50,000 a year. The work was performed in a very slovenly manner and caused considerable annoyance. One of the first acts of the Board was to break up this arrangement, declare the contract violated and place the work in new hands at greatly reduced expense. The result was a suit for $300,000 against the city which the Board successfully defended.

PETROLEUM REFINING.—There was one petroleum refinery in the city on the Hudson River at 60th street, from which offensive emanations spread over the upper part of the island. After many fruitless efforts to induce the company to carry on the business in an inoffensive manner, the Board was compelled to drive the business out of the city; one of the few cases—there being, we understand, but two others—in which it was not possible to secure the introduction of improved processes and machinery into offensive establishments, and thus permit them to remain in the city.

SUBURBAN NUISANCES.—After the offensive trades carried on in the city had been brought under control, it was found that very offensive odors still continued to cause great annoyance on the east side of the city. Careful investigation showed that these odors were chiefly caused by a few fertilizer factories at Hunter's Point and Green Point, in which the sludge acid of the petroleum refineries was employed in the manufacture of super-phosphates. After every effort had failed to induce the local authorities to put a stop to the nuisances, and after it had been found impossible to induce the Legislature to enact a law for the suppression of nuisances, which originating in one locality produce their evil effects in other localities having no jurisdiction over them, an attempt was made to reach these factories under a special act designed for another purpose. The Board had secured the necessary evidence with great difficulty, fixing the nuisance at particular times upon each of the factories, and was engaged in prosecuting them, when the farce of indicting the members of the Board by the Grand Jury was enacted. While officers of the Board were prosecuting the real offenders at one end of the Court House, the Grand Jury were indicting them at the other, the Grand Jury insisting that the odors complained of originated in the factories in New York, which the Board had failed to suppress. When the Board secured a hearing on the indictments Judge Sutherland quashed them.

MARKETS.—One of the first acts of the new Board, in 1873, was the destruction of the two-story structures which covered half the roadway of the public streets adjacent to Washington Market, almost surrounding the block and interfering with the traffic in these thoroughfares. Many attempts had been made to remove them, but without success. They were in a filthy condition, and great quantites of garbage had accumulated beneath them, giving rise to offensive odors, and tending to taint all the food supplies exposed for sale in the market. After exhausting peaceful methods, the Board decided to resort so force. One hundred and fifty carpenters and laborers, 300 policemen, and a corps of surgeons, in anticipation of forcible resistance, were one evening led by Dr. Chandler to the market, and before morning the buildings were leveled, the materials carted away to the corporation yards, and the pavements, which had not had the light of the sun for 20 years, swept clean. A suit was brought in consequence against the city for about $60,000, but was successfully defended. Similar action was taken with the stalls around Fulton, Centre and other markets.

CONTAGIOUS DISEASES.—In 1874 the Legislature directed the Board to assume control of contagious diseases, and the hospital at the southerly end of Blackwell's Island was placed in its charge. This hospital had been so managed as to create a prejudice in the minds of the public, which led to the concealment of cases of contagious diseases from the authorities, through fear that the removal of a patient to the hospital would insure death. The first step of the Board was to change the name to Riverside Hospital in place of small-pox hospital; secondly, they secured a corps of sisters of charity to act as nurses, together with competent resident physicians.

The third step was the purchase of a handsome coupé for the conveyance of the sick. In a few months, as a result of these measures, says Dr. Chandler, the prejudice against the hospital disappeared, few cases were concealed, and a material reform was effected.

A corps of vaccinators was established, and systematic house-to-house vaccination was resorted to, and has been since maintained. To remove the prejudice against humanized virus, a vaccine farm was established and bovine virus was exclusively used. About 500,000 persons have been vaccinated gratuitously since the system was inaugurated. There has been little small-pox in the city, notwithstanding that there has been an alarming amount of it in other localities.

A system of disinfection has also been established in connection with a disinfecting corps, so that these measures also can be applied to prevent the spread of contagious disease. The system adopted by the Board has met with favor, and has been adopted by the New York State Board of Health, the National Board of Health, the city of Rome and the Kingdom of Belgium.

THE SUMMER CORPS.—Owing to peculiarities of our climate we suffer during the latter part of July and early part of August the most distressing weather, when the atmosphere is at high temperatures, with excessive humidity. The weather is particularly unfavorable to children, and often results in adding several hundred deaths to the ordinary death rates. In one week the rate has been known to rise from 500 to 1,500, nearly 1,000 children falling victims to the diarrhœal diseases induced. In order to reduce as far as possible this excessive mortality, a summer corps of fifty physicians is employed, one being allotted to each of the fifty districts into which the tenement house regions are divided. It is his duty to visit every room in his district, treat all sick children, furnish necessary medicines, give advice to the mothers, place in their hands instructions for the the care of infants, printed in English and German, and distribute tickets for excursions on the barges of St. John's Guild. As an illustration of the work accomplished, we are informed that the physicians of the summer corps made 130,000 visits in one month, at a cost to the city of $5,000. The good effects of the work enabled the Board to secure each year an appropriation of this sum to continue the work; this year the appropriation is $10,000, and the corps will be employed for two months.

TENEMENT HOUSES.—Statistics having shown that two-thirds of the deaths occur in that half of the population which resides in tenement houses, efforts have been made to improve the condition of these structures, and a large part of the labor of the Department has been directed to their inspection and reconstruction. Although much was thus accomplished, it was found that they were constructed on plans which made it impossible to secure light and ventilation by any practicable changes. With a view to a radical improvement in the condition of tenement houses, THE SANITARY ENGINEER, with the aid of a few public spirited citizens, offered prizes for plans for improved tenement houses. These plans were carefully considered by a committee, of which Dr. Chandler was chairman, and prizes were awarded. Public meetings were held, the Sanitary Reform Association was organized, and, working in conjunction with the health authorities, secured the enactment of such amendments to the Tenement House Act as gave the Board of Health complete control of all tenement houses to be thereafter erected. This law went into effect about three years ago, and since that time every tenement house, apartment house and lodging house has been constructed upon plans previously approved by the Board of Health. In this period, it is believed, accommodations have been provided in new structures for nearly one hundred thousand persons, and in every case adequate means for light and ventilation have been provided. This result has not been secured without some litigation; but as the Board has been sustained by the Courts as well as by public opinion, builders and architects, with few exceptions, have complied with their requirements.

PLUMBING AND DRAINAGE.—A large part of the work of this Board has been the inspection of the plumbing and drainage of dwelling houses. It has been generally found that many serious defects existed by which emanations from the sewers, often carrying germs of disease, find access to living and sleeping rooms. Not only was the work defective in execution, but it was generally found to be radically faulty in principle, and the Board undertook experiments to ascertain the modifications of the system which would remedy the evils. A model of house drainage was erected at the Board of Health rooms upon which experiments could be made, and which served to demonstrate the imperfections of the system generally employed. It was thus readily shown that no house was safe from sewer gas unless the soil pipe was carried through the roof, a trap placed between the house and the sewer and an inlet for air provided inside the trap, a proper trap placed under every fixture, every trap vented to prevent syphonage, and over-flows, refrigerator and safe wastes disconnected from the sewer. So apparent were these improvements, that the Sanitary Reform Association secured the enactment of a law for the registration of of plumbers and for placing the control of plumbing and drainage in all new buildings in the hands of the Board of Health. The law went into effect June 4, 1881, and since that time the plumbing and drainage of every building erected in this city has been in accordance with a plan previously approved by the Board of Health. The rules adopted by the Board were matured after consultation with the best plumbers, architects and sanitary engineers, and have proven so satisfactory that they have been adopted by many other large cities.

IMPROVEMENT IN THE PUBLIC HEALTH.—"No one," says Dr. Chandler, "could doubt for a moment that such comprehensive sanitary work, over a period of over ten years (and in fact, begun by the Metropolitan Board of Health in 1866), should make a great improvement in the health of the city." The ordinary method of comparing vital statistics by the death rate per 1,000 of population is considered defective by the New York City authorities, and as leading to very erroneous conclusions, since it depends, first, on an exact record of the number of deaths, and second, on an exact enumeration of the population, and there are many localities in which neither factor can be obtained with accuracy. There is always danger that the death returns will be imperfect, depending on the voluntary report of sextons and undertakers, and the population is generally over-estimated. In some American cities, the population, on which the death-rate is estimated, is 15 or 20 per cent. greater than it actually is. To obtain a more reliable method of comparing death rates, the Board of Health has compared the deaths among themselves.

In 1866, of every 100 deaths in the city, 53 were of children under five years of age, while 47 were of persons over five years. The efforts at sanitary improvement, together with the increased intelligence secured by the efforts of the sanitary authorities, the sanitary organizations and the press, have succeeded in reducing this ratio, year by year, until now, of 100 deaths, only 46 are under five years of age. If we compute the effect of this change, it will be seen that 5,000 children are saved per annum in this city, without claiming any reduction in the death rate of persons over five years of age. As there is no reason to suppose that the improvement is limited to the children, it is, in the opinion of the Board of Health, no exaggeration to estimate that at least 8,000 lives are saved every year, as the result of these sanitary reforms. For each death, there are 28 cases of severe sickness, and thus the amount of good accomplished becomes enormous.

PROJECTED IMPROVEMENTS.—At the present time the Board is engaged in erecting hospitals for contagious diseases on North Brother's Island. In the autumn, the Riverside Hospital on Blackwell's Island will be abandoned, and all cases of contagious diseases will be transfered to the new hospitals on North Brother's Island.

Digitized by Google

In addition to this, a site has been secured in East 16th street, and work will be begun at once upon a hospital for scarlet fever and diphtheria.

STATE BOARD OF HEALTH.

Three years ago a State Board of Health was established and the President of the City Board became a member and chairman of the Sanitary Committee. The two boards have acted in harmony and have been of great assistance to each other. A law was enacted forbiding the adulteration of foods and drugs throughout the State. Another law was also enacted, prohibiting the sale of dangerous kerosene. As the enforcement of both these measures required a knowledge of practical and analytical chemistry, it has been intrusted to Dr. Chandler of the Sanitary Committee. Public analysts have been appointed, and samples of foods, drugs and oils have been collected in various parts of the State. A few test cases have been tried under the food and drug act, and one test case under the kerosene act, and arrangements are now nearly completed for the enforcement of these acts in every part of the State.

THE MAGNITUDE OF THE WORK.—At the present time it is probable that there is no other city in the world which has so complete a sanitary organization as New York. The inspection, vaccination, engineer, disinfection corps, clerks, nurses etc, number 125 persons beside 50 physicians and the extra corps of disinfectors and fruit inspectors employed in the summer, and the permanent corps of 30 sanitary policemen. Appropriations for the current year, including moneys to be expended on the hospitals, amount to $500,000.

COVERED SERVICE RESERVOIRS.

At the meeting of the Institution of Civil Engineers on the 20th of February, Mr. Brunlees, President, in the chair, a paper was read on "Covered Service Reservoirs," by Mr. William Morris, M. Inst., C.E., of Deptford.

The author alluded to the fact that covered reservoirs were used by the Romans and other ancient people for keeping water cool and pure for potable purposes, and showed that their use was by no means a recent refinement, although they had only lately been introduced in modern water works. It did not appear, from official returns, that covered reservoirs were used in London in 1850, when filtration had only been partially introduced. But it soon became evident that covered reservoirs were necessary for the storage of filtered water, and accordingly it was enacted by the Metropolis Water Act, 1852, which required all water (except water pumped from wells) to be filtered, that all reservoirs for filtered water within five miles of St. Paul's cathedral should be covered. This enactment was more particularly intended to preserve the water from contact with the smoke of London; but the objection to uncovered reservoirs was by no means confined to the neighborhood of large towns, as owing to the rapid growth of vegetable and animal life in service reservoirs, the improvement from the filtration of the water was rapidly lost, especially during the summer. As examples, the author referred to the uncovered reservoirs constructed at the cost of the Admiralty in Greenwich Park and on Woolwich Common, for the protection, in case of fire, of the Greenwich Hospital, Royal Dockyard, and other Government establishments, which were partially used by the Kent Water Works for the supply of their district. The author then proceeded to describe the covered reservoirs at Plumstead and at Shooter's Hill, purchased by the Kent Company. These were covered by brick arches, springing from cast iron girders. Then followed descriptions of different works, including the Chislehurst Reservoir, which was built of brick, covered with arches supported by cast iron girders, and rendered internally with cement. The circular reservoir purchased from the Dartford Local Board of Health was covered with brick arches supported on nine wrought iron joists radiating from the centre, where they were supported by a cast iron column. The circular reservoir in Greenwich Park consisted of brick arches, resting on concentric rings of rolled wrought iron girders supported by piers. The filter-beds at Deptford were converted into covered reservoirs, consequent on the Kent Company abandoning the supply from the river Ravensbourne in favor of spring-water from the chalk, in which case the old filtering material was utilized in the construction of the concrete vaulting. The covering of a small reservoir at Plumstead with Bunnett's flooring was described, and the construction of a covered reservoir on Woolwich Common in lieu of the old one referred to, when relinquished by Government. This was an oblong reservoir 200 feet long by 100 feet wide; the walls were of concrete faced with brick; the covering arches were of brick, springing from rolled joists supported on brick piers. The above works were designed by the author's father, the late Mr. W. R. Morris, M. Inst., C.E.

The author then described the New Cross Reservoir, built under his direction in 1874, which was similar to that on Woolwich Common, except that the roof consisted of brick arches springing from the piers instead of rolled joists. He then gave a full description of a reservoir recently constructed by him at Farnborough, Kent, in which the outer walls were reduced to a minimum, by supporting the covering arches till their springing was level with the centre from which they were struck. This system was adopted for the end as well as for the side walls. An account was given of a slip which occurred during the construction of the reservoir, and of the means taken for making the work secure.

The East London Water Works Company had at Hornsey Wood a fine brick reservoir which was capable of containing 5,000,000 gallons of water. The same company had at Haggar Lane a reservoir capable of containing 1,500,000 gallons. This also was built of brick; the vaulting was supported by longitudinal walls, stiffened by transverse walls, so that the reservoir was divided into 49 sections, the walls of which were pierced with circular openings. The Kilburn Reservoir, capable of containing 6,000,000 gallons, was a fine brick structure, with vaulted roof, supported on cruciform piers; the outer walls were supported by buttresses against the pressure of the external earth. The Hampton Reservoir, capable of containing 2,750,000 gallons, was constructed entirely of concrete. This reservoir was built in clean, sharp gravel, and the excavated ballast was admirably adapted for the concrete. The arches sprung from wrought iron joists. The Burton-on-Trent Reservoir, built for the South Staffordshire Water Works, had a capacity of 4,000,000 gallons; it was rectangular in plan, and was covered with brick arches springing from cast iron girders, supported on cast iron columns; the walls were of concrete, faced with Staffordshire bricks.

The author then referred to several service-reservoirs, of which he had the opportunity of learning some particulars during a recent tour. The Charlottenburg Reservoir, of the Berlin Water Works, with a capacity of 5,000,000 gallons, was built of brick, with walls sufficiently thick to resist the internal pressure of the water; the soil was fine, loose sand, on which bitumenized paper was spread before laying down the concrete foundations. The Berlin filter-beds were covered with Bohemian vaulting, the foundation of which rested on gravel puddle. The reservoir at Breslau, capable of containing 900,000 gallons, was supported on a tower 130 feet high, and the tower contained the pumping engines. The author then described one of the Vienna reservoirs, and furnished some notes on the aqueduct which supplied that city. The water works of the city of Munich, which were in course of construction at the time of his visit, comprised a reservoir having a capacity of 8,800,000 gallons; the walls and floor were of concrete, the vaulting was semicircular, built with one ring of brick. The author gave a sketch of the Frankfort Reservoir, and some notes as to the water supply of the city. The reservoir and works of the Darmstadt water works were noticed; the reservoir was of brick, built above ground; it was capable of containing 900,000 gallons; the water was pumped from six tube-wells, sunk in the sandy plain between the Odenwald mountains and the Rhine at Griesheim, about five miles from the city. The reservoir at Cologne, which consisted of a cast iron tank, with a capacity of 800,000 gallons, was erected on a tower 100 feet high; the water supplied to the city was pumped from wells on the banks of the Rhine; but the spring water was quite distinct from the Rhine water. The Dresden Reservoir was capable of holding 4,600,000 gallons of water. The Hanover Reservoir, with a capacity of 2,400,000 gallons, was of brick. It stood 30 feet above the ground line, and the outside walls supported the full pressure of the water without the assistance of any embankment.

After some remarks on the marked preference of Germans for spring-water as compared with lake-water or river-water, the author concluded the paper with a sketch of his idea of a model service reservoir. This was so arranged that the earth dug from the excavation was all utilized in forming the necessary embankment. The floor and the side walls were of concrete, the piers, arches and vaulting of brick. The vaulting was similar to that of the Farnborough reservoir, but the ends of the vaults were brought down with a curve of 12 feet, six inches radius, till they rested on correspondingly curved bays in the concrete end walls. By this construction the thrust of the roof would be carried down to an abutment resting against undisturbed ground, and the pressure of the water on the reservoir would not only be supported by the abutment but be also counterbalanced by the weight of material facing the embankment, which rested on the extreme arches of the reservoir, in addition to the pressure of the earth which would have to resist internal pressure if the walls were vertical. The author held that the whole of the interior surface should be rendered in cement mortar. —*Building News.*

LIVERPOOL CORPORATION WATER WORKS. WASTE WATER DEPARTMENT.

Number of inspections made and defects discovered by the Waste Water Inspectors during the year ending 30th December, 1882:

Number of first inspections, 131,329; pipes visible, 2,310; hidden, 2,471. Defects discovered: Draw-off cocks and stop-cocks, 10,600; ball cocks in storage cisterns, 2,204; water closet appliances, 10,399; total, 31,984. Number of defects reported by inspector, 10 418.

(*a*) These inspections do not include re-examinations for the purpose of ascertaining that defects discovered by the inspectors have been repaired in accordance with the notices served upon the persons responsible for the maintenance of the fittings. Two special inspectors are employed upon these re-examinations, and in inspecting new plumbing work.

(*b*) The "hidden" leakages are underground defects discovered by night soundings, and which could not be found by ordinary or superficial inspection.

(*c*) These are defects repaired by the inspectors in the ordinary course of their examinations, and are included in the total number of defects discovered.

J. PARRY.

WATER DEPARTMENT, MUNICIPAL OFFICES, LIVERPOOL, *March*, 1883.

Reviews of Books.

TWENTY-NINTH REPORT UPON THE BIRTHS, MARRIAGES AND DEATHS IN THE STATE OF RHODE ISLAND, for the year ending December 31, 1881. Prepared by Charles J. Fisher, M.D., State Registrar of Vital Statistics. 157 pp., 8 vo. Providence, 1882.

This is a valuable public document, being one of the very few State registration reports of this country which can make any pretence to accuracy and completeness.

Not that complete data have been obtained, but at least there is a respectable approximation to such, and there is an improvement in this respect upon previous returns. The number of births registered during the year was 6,761, of which 264 were still born; the number of marriages was 2,750, and of deaths 5,016. This gives a death rate of 18.1 per thousand, as against the rate of 17.5 in 1880; but this is on the supposition that the population in 1881 was the same as that shown by the census of 1880, which is of course incorrect.

The city of Providence contains about 38 per cent. of the population of the State, and its death rate in 1880 was 19.8 per 1,000, while the rate for the rest of the State was 16.0 per 1,000, being probably about two per thousand too low, owing to incomplete returns. Dr. Fisher seems to have made no attempt to estimate the population for 1881, but has calculated all his percentages on the population of 1880, so that these percentages are not properly comparable with those of other State reports.

It is true that the increase of population in this State is comparatively slow, being in 1870 217,353, and in 1880 276,531, and that the returns are so incomplete that even with the smaller population of 1880 the ratios are still no doubt too low, so that the matter is not one of practical importance.

The diseases which stand at the head of the list as having caused the greatest namber of deaths during the year are as follows: Consumption 706, pneumonia (including congestion of the lungs) 327, diseases of the heart 203, old age 247, cholera infantum 240, diphtheria 216. Dr. Fisher remarks that "more than one-quarter of all the

Digitized by Google

deaths that occur in Rhode Island are caused by diseases of the lungs and respiratory passages. Of these consumption is by far the most destructive. It has stood at the head of the list of the most prominent causes of death during the whole period of registration."

Of the 706 decedents from consumption, 429, or 60.8 per cent., were of foreign parentage. The report contains a careful and interesting study of the statistics of consumption in the State, which is too long to be given here, and which cannot be summarized. We commend it for examination, both as to its matter and its form. The mortality from consumption in Rhode Island has been steadily diminishing for the last 17 years—but the lessened mortality is confined almost exclusively to the population of American parentage.

Taken as a whole, the report represents much good work and careful study, and it is commended to all sanitarians, as well as statisticians, as one of which they should by all means endeavor to secure a copy.

CENSUS OF THE CITY OF PROVIDENCE, January 1, 1883. Taken under the direction of EDWIN M. SNOW, M.D. 28 pp., 8vo. Providence, 1883.

As shown by this Census the total population of Providence is 116,755, of which 55,736 are males and 61,019 females. Th·se occupied 14,804 dwelling houses, or 25,-977 · tenements, thus forming 25,977 families. The average number of tenements to each house is 1.78. The number of families to each dwelling has increased, while the average size of families has decreased; the general tendency being to increase the crowding of population. The average number of persons to each dwelling was found to be 7.77 as against 7.18 in 1878 and 7.58 in 1875. In the different wards of the city this number varies from 6.72 to 8.85.

The total number of children of school age (5 to 15 years) was 22,062, and of these 17,287 were attending school, which is a very favorable showing.

SIXTH ANNUAL REPORT OF THE BOARD OF HEALTH, OF THE STATE OF NEW JERSEY. 1882. 361 pp., 8vo.

One hundred pages of this volume are occupied with the report, of the Bureau of Vital Statistics, for the year ending July 1, 1882. From this we learn, that during the year, there were recorded 8,837 marriages, 23,108 births, and 25,942 deaths. This gives a death rate for the whole State of 22.9 per 1,000, and for cities of over 5,000 inhabitants of 26.71 per 1,000. This is a marked increase (over 5,000 deaths) over that of the preceding year, and about one half of this increase occurred in Essex and Hudson counties.

C. J. Rooney, Jr., the Registrar of the Hudson Co. Board, remarks that "the greater part of the increase of mortality took place among persons over five years old, and was due mainly to consumption, small-pox, pneumonia, croup, scarlet fever, diphtheria, typhoid and typho-malarial fevers, measles, bronchitis and meningitis."

The increase of 1,258 deaths in Essex County, depends chiefly on an increase of 1,028 in the city of Newark.

We do not find among the reports from the local boards of health, any report from the Boards of Hudson County, or of Newark, giving the reasons for this increase, nor does the State Board furnish any information on the subject.

It seems to us that such a marked localized increase in mortality calls or an investigation into its causes.

Very little information is given in the tables in the report on vital statistics, which are meagre in the extreme, and form a strong contrast to the elaborate tables given in registration reports of Massachusetts, Connecticut, Rhode Island and Michigan. We are told that extended tables are reserved for the next report, which will include the data for five years, but it seems to us that it would be better to give the data fully each year.

Turning now to the report of the Secretary of the Board, Dr. E. M. Hunt, we find that it is essentially a good popular lecture upon the importance of sanitary work, fortified with extensive quotations from Herbert Spencer, Bailey Denton, Galton and others. It takes up water supply, drainage, malaria, city sewers, disposal of sewage, offensive trades, State sanitary survey, local health boards, health of operatives, grave yards, diseases of animals, etc., but it does not furnish any information as to the condition of any of these matters in the State of New Jersey.

Now it seems to us that this is a mistake. It is of course much easier to sit down and write a paper on the importance of sewers than it is to investigate the system of sewerage of Newark or Trenton, and state the defects and needs. But the time has gone by when essays and quotations can take the place of actual investigation and practical concrete recommendations on the part of a salaried health official.

We say this with all deference to Dr. Hunt's experience as to the sanitary needs of his own State, and because we know that on the part of the educated public there is a growing impatience with vague abstract recommendations, to which it will be well for sanitary officials to give heed before it is too late.

The models for State Board of Health reports, are the reports of the Medical Office of the Privy Council and of Local Government Board, and of the Massachusetts State Board of Health before its consolidation, and these furnish facts, as well as opinions.

Following the Secretary's report come four papers on small-pox and vaccination by Dr. T. F. Wood, of Wilmington, N. C., Dr. E. M. Hunt, the Secretary of the Board, Dr. E. L. Griffin President of the Wisconsin State Board of Health, and Dr. E. J. Marsh, President of the Board of Health of Paterson, N. J.

These papers are mainly devoted to the discussion of the relative merits of bovine *vs.* humanized lymph, of utility of re-vaccinations, and of the means of determining the value of the lymph, and of the protection as related to the scar. They give a good *resumé* of what is known in the subject, and we commend them to all who are interested in the subject. Dr. Marsh's paper is short, but it gives the results of his own experience, and is therefore fresh and interesting. He thinks that both bovine and humanized virus should be retained in use.

A paper on Disposal of Sewage in Cities, by Col. Julius W. Adams, C.E., is a valuable contribution on the subject. His statements regarding the pail or tub system coincide with our own investigations. In discussing systems of sewerage there is an evident preference for the combined system, yet the whole subject is gone into in such a manner that we commend the paper to those who are interested in the subject.

Dr. Albert R. Leeds contributes an interesting paper on Infant Foods, in which he points out the unreliability of certain conclusions that have been widely quoted. We shall probably refer to this paper at another time.

Prof. Charles McMillan, C.E., Princeton, contributes a paper on the disposal of town sewage, which is a summary of English and French experience on this subject.

Dr. Hunt furnishes a short paper on the causation of typhoid fever by cesspools, taking as examples an outbreak at the Centenary Institute at Hackettstown where there were 30 cases and four deaths, an outbreak in a hotel on the seashore and one in the Hudson County almshouse, in all of which there was defective drainage.

A paper by Prof. Brackett, on the regulation of moisture in rooms, we shall notice more fully hereafter, from which we learn that 18 complaints against persons selling impure milk have been made, of which six have been fined fifty dollars each, five are still pending and seven have been discharged on payment of costs. He is strongly in favor of the New York law forbidding the sale of skimmed milk, and thinks that the food adulteration law is fully competent to cope with the adulteration of milk, and the inspector should be required or authorized to bring his complaints under that law, which seems to us quite correct.

Dr. E. M. Hunt has an interesting paper in local sanitary inspections of sea-side resorts, etc., giving the results of his examinations at Cape May, Atlantic City, etc., which we commend for perusal to all who visit these resorts. Though we are disposed to complain because we do not find in this report that information about sanitary matters in New Jersey which a State Board of Health report should contain, yet we can commend it as well calculated for family reading throughout the State.

THE NATION.

We have received the list of "Books Reviewed in the *Nation*," during the quarter ending March 31, 1883. Probably in no other American periodical is the same amount of special knowledge utilized for readers, as in the Book Columns of the *Nation*, from which these titles are taken.

BOOKS RECEIVED,

JOURNAL OF THE FRANKLIN INSTITUTE, May, 1883.

PUBLIC OFFICIAL CARE OF ORPHAN AND DESTITUTE CHILDREN *VERSUS* PRIVATE BENEVOLENCE. Letter regarding Assembly Bill 121.

MAP OF THE WOOD RIVER MINING REGION. *Wood River Times*, Hailey, Idaho.

REPORTS OF THE TRUSTEES OF THE SANITARY IMPROVEMENT BONDS, OF THE CITY OF JACKSONVILLE, FLA., to the City Council, July 1, 1881, July 1, 1882, and March 14, 1883, with Report of Engineer and Tables annexed.

ANSWERS TO INQUIRIES ABOUT THE U. S. BUREAU OF EDUCATION, its Work and History. Prepared under the direction of the Commissioner, by Charles Warren, M.D. Washington: Government Printing Office, 1883.

JOURNAL OF THE ASSOCIATION OF ENGINEERING SOCIETIES—BOSTON, ST. LOUIS, CHICAGO, CLEVELAND. February, 1883.

QUARTERLY REPORT OF THE CHIEF OF THE BUREAU OF STATISTICS, Treasury Department, relative to imports, exports, immigration and navigation of the United States, for three months ending Dec. 31, 1882.

We have received from Mr. C. S. Sargeant, THE REPORT OF THE BOARD OF HEALTH OF THE CITY OF NEWBURYPORT, MASS., for 1882.

STATISTICAL TABLES FROM THE HISTORY AND STATISTICS OF AMERICAN WATER WORKS. By J. J. R. Croes, M. Am. Soc. C.E., M. Inst. C.E. Compiled from Special Returns. Published by *Engineering News*, New York, 1883. Paper, pp. 113.

AN OPEN LETTER TO THE AMERICAN (COAL) GAS LIGHT JOURNAL, replying to the Editorial of March 16, 1883, "Carburetted Poison." A. O. Granger & Co., Philadelphia, 1883.

PLUMBING LAW VIOLATIONS.

Nine violations of the plumbing regulations were reported at the Health Department of this city, last week, by the following inspectors: Dickinson, three; Hollick, two; Hooper, Elliot, Hicinbotham and Golden, each one. None were of a very serious nature. No cases were referred to the attorney. No violations of light and ventition plans were reported.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

AUTOMATIC SHUT-OFF FOR GAS PUMPING ENGINES.

The following inquiry has suggested a description of an automatic arrangement for turning off the gas supply to a hot air pumping engine, recently arranged by Messrs. Pasco & Palmer, plumbers, of this city:

METROPOLITAN GAS LIGHT CO.,
BROADWAY, CORNER OF 46TH ST.,
NEW YORK, *April* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR:—Can you let us know whether there is any device whereby the gas supply to the Caloric Pumping Engines can be shut down to a mere spark when the water tank is full, and turned on again when the tank is empty, automatically, and much oblige,

Yours respectfully,
O. F. ZOLLIKOFFER, *Sec'y.*

[The device represented in the drawing does not do

what our correspondent asks for, which would seem to be a much more difficult thing to accomplish than to

Digitized by Google

simply turn off the gas, since the hot air pump in most common use is a single crank engine, requiring the proper adjustment of the piston before starting.

The following is an explanation of the arrangement shown in the sketch: On the gas pipe *d*, supplying the engine, is a stop cock, on which a grooved iron wheel takes the place of a handle. A chain, attached to a pin at the point *a* in the circumference of the wheel, passes over the top and supports a small tin pail, *c*. The end of the tank tell-tale *e* is brought over the pail, so that the weight of the water discharged into it will cause the pail to fall, thus turning the wheel and closing the valve on the gas pipe. Before starting the pump again the pail is emptied. The large pipe *f*, shown on the right hand, is an air chamber on the suction pipe to supplement the smaller one attached to the pump. The stop-cock *g*, at its foot, is for removing all the water from it.

There are other devices for the same purpose, such as a small tank under the tell-tale, containing a float connected with the valve on the gas pipe, but the arrangement shown above is simpler than anything we have seen for the purpose.]

Construction Notes.

The Roesch tile pipe bill, having before passed the New York Assembly, last week passed the Senate, and now goes to the Governor.

COHOES, N. Y.—The Water Company is to have made an examination and report by J. J. R. Croes, C. E., for a supply of water by gravity.

REVERE, MASS.—The Revere Water Company asks authority to contract with the town of Revere, Mass., to supply the town with water, for fire and other purposes.

MISSION BAY, CAL.—A bridge company, capital $50,000, has been incorporated to build a bridge over Mission Bay.

NEWTON, N. J.—The question of a water supply is being agitated. It is estimated that a sufficient quantity can be secured by an outlay of $40,000.

LYNN, MASS.—There has been one hearing before the legislative committee on Lynn's petition to take Saugus River and its tributaries as an additional water supply source. Members of the committee went to Lynn last week and looked over the territory about the water sources. Hon. B. W. Harris, representing the town of Saugus, accompanied the party and objected to the granting of the petition of Lynn, on the ground that the principal industry of the town of Saugus would be ruined thereby.

CHICAGO.—Commissioner Cregier, of the Board of Public Works, has accepted the proposition of the Pittsburgh, Fort Wayne & Chicago Railroad Company to give the land required to straighten the river between Adams and Van Buren streets, provided the city would build a dock there and dredge the river. The improvement will be made this spring, to the great satisfaction of the shipping interest.

WARREN, MASS.—The rebuilding of the bridge, for which there is appropriated $480,000, is to be done by day's work, not by contract.

WASHINGTON, D. C.—The contract for cut granite for backing and pier stones for the west wing and centre wings of the building for the State, War and Navy Departments has been awarded to the Ellsworth and East Blue Hill Granite Co., East Blue Hill, Me., at one dollar per cubic foot, net dimensions.

DETROIT.—The Water Commissioners have awarded a contract for iron pipe to the Cincinnati & Newport Iron Company for $42,000.

NEW ORLEANS.—The following contract for erecting the new Produce Exchange Building was awarded by the Building Committee, to be built after the plans of James Freret, architect: to Messrs. O'Neil & Garvey, basement granite, balance brick and Portland cement, $29,040.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

269,334. PIPE JOINT. ROLAND H. SMITH, PITTSBURGH. Pa. Filed June 14, 1882. (No model.) Issued Dec. 19, 1882.

Claim.—1. In combination with the pipe sections, provided with under cut recesses, the metallic packing cast, contracted, and tamped therein, substantially as specified.

2. The combination, with the two sections of a gas or water main, constructed, as described, of the metallic gaskets or packings, leaving an interposed space, and the pipe section leading therefrom, substantially as and for the purposes specified.

269,531. FAUCET. JAMES MCGINLEY, Chicago, Ill. Filed Feb. 18, 1882. (No model.) Issued Dec. 26. 1882.

Claim.—1. A faucet provided with a rubber sponge-ball vulcanized on the outside and inside, substantially as and for the purpose specified.

2. In a faucet, the combination, with the detachable parts C, D, forming chamber B', said part D having a slot *a'*, of the perforated ball B, inclosed in said chamber, and the spindle S, having valve E, collar *d*, and lug *a*, all substantially as and for the purpose described.

269,507. PIPE-COUPLING. CHARLES H. POPE, Thomaston, Me. Filed March 22, 1882. (No model.) Issued Dec. 26, 1882.

Claim.—The combination, with the pipe ends having upset flanges *c c*, of the connected clamping-pieces A B, having the inclined or beveled edges *a b*, substantially as described.

269,648. DEVICE FOR WASHING A COMBINED URINAL AND PRIVY-COVER. SIGMUND EDINGER, New York, N. Y. Filed Sept. 22, 1882. (No model.) Issued Dec. 26, 1882.

Claim.—1. The combination, with a combined urinal and privy-cover, consisting of a pan and an auxiliary cover, of devices to introduce water therein to for the purpose of washing the same, substantially as set forth.

2. The combination, with a combined urinal and privy-cover consisting of a pan and an auxiliary cover, of devices to spray water into said pan and onto the inner face of its auxiliary cover, substantially as set forth.

3. The combination, with a combined urinal and privy-cover, the same being attached to the seat of a closet, of a water-pipe and a pipe movably connected with the pipe aforesaid, and extending into the urinal and privy-cover, the portions of the pipe located therein being perforated.

4. The combination, with a combined urinal and privy-cover, the same being attached to the seat of a closet, of a closet water-pipe extending above said closet-seat, the end of the pipe being provided with a perforation, and a pipe secured to and extending into the urinal and privy-cover, the outer end of a pipe being movably connected with the pipe aforesaid, and provided with a perforation to register with the perforation thereof.

269,651. MANUFACTURE OF LEAD PIPE. JOHN FARRELL, Pittsburg, Pa. Filed Aug. 26, 1882. (No model.) Issued Dec. 26, 1882.

Claim.—1. A coil of lead pipe, such pipe being of oval, flattened, or elliptical form in cross-section and wound or coiled in the plane of its greatest diameter, substantially as set forth.

2. The improvement herein described in the art of preparing lead pipe, consisting in giving the pipe an oval, flattened, or elliptical form and coiling or reeling it by bending in the plane of its greatest diameter, substantially as and for the purposes set forth.

269,687. FAUCET. HENRY B. LEACH, Boston, Mass. Filed Oct. 12, 1882. (No model.) Issued Dec. 26, 1882.

Claim.—1. In a faucet, the combination of the spindle C, provided with one or more arms, C^{11}, the screw-nut H, provided with the slot H^{1} and the recess H^{11}, and the valve I, provided with the valve stem I^{1} and lifting-pin I^{11}, all arranged and constructed substantially as and for the purpose described.

2. In a faucet, the combination of the valve I, provided with the valve-stem I^{1} and lifting-pin I^{11}, and the screw-nut H, provided with the recess H^{11}, and adapted to be turned by means of the spindle C, substantially as and for the purpose set forth.

3. In a faucet, the combination of the screw-nut H, provided with the perforation or passage H^{111}, the valve-stem I^{1}, swiveled in said screw-nut; substantially as and for the purpose specified.

4. In a faucet, the combination, with the spindle C, provided with an enlarged base or lower end, of the swivel-plate D and spring F, substantially as and for the purpose described.

5. The combination, with the spindle C C^{11} and valve I I^{1} I^{11}, of the screw-nut H, provided with the stops *h h*, substantially as and for the purpose set forth.

6. The combination, with the spindle C, spring F, and swivel-plate D, of the plate E, substantially as and for the purpose described.

269,784. SOLDERING-TOOL. MAXIMILIAN F. HABER, Baltimore, Md., assignor to the Scott Manufacturing Company, same place. Filed Sept. 12, 1882. (No model.) Issued Dec. 26, 1882.

Claim.—1. In combination with the block A, the soldering-plate B, hinged clamp C, and set-screw *b*, substantially as specified.

2. The block A, having the projections *d*, combined with the clamp C and the soldering-plate B, substantially as specified.

569,268.—FIRE ESCAPE. OSCAR F. DAVIS, TOPEKA, KANS. Filed Jan. 16, 1882. (No model.) Issued Dec. 19, 1882.

269,273. ELECTRIC FIRE ALARM AND EXTINGUISHER, CLARENCE A. EVANS, Upland, Pa. Filled Sept. 9. 1881. Renewed May 13, 1882. (No model.) Issued Dec. 19, 1882.

269,280. CONCRETE ARCH FOR SIDEWALKS AND OVER AREAS. GEORGE GOODMAN, San Francisco, Cal. Filed Aug. 10, 1882. (No model.) Issued Dec. 19, 1882.

269,282. GOVERNOR FOR GAS EXHAUSTERS. ROBERT P. GREEN, Columbus, assignor of one-half to John Anderson, Cincinnati, Ohio. Filed Aug. 15, 1882. (No model.) Issued Dec. 19, 1882.

268,289. PAVEMENT. EDWARD HEYLYN, Brooklyn, N. Y. Filed July 24, 1882. (No model.) Issued Dec. 19, 1882.

269,292. ILLUMINATING BASEMENTS. PETER H. JACKSON, San Francisco, Cal. Filed Oct. 10, 1882. (No model.) Issued Dec. 19, 1882.

269,295. WATER RAISING DEVICE. CHARLES K. KIRBY, San Francisco, Cal. Filed Aug. 26, 1882. (No model.) Issued Dec. 19, 1182.

269,307. GAS BURNER. JAMES G. MILLER, Green Bay, Wis. Filled May 4, 1882. (No model.) Issued Dec. 19, 1882.

269,308. BOILER. JOSEPH R. MITCHELD and [illegible] San Francisco, Cal. Filed May 22, 1882. (No model.) Issued Dec. 19, 1882.

269,310. WELL AUGER. JAMES H. MURRAY, [illegible] Filed June 28, 1882. (No model.) Issued Dec. 19, 1882.

269,324. CAR STOVE. ABRAM REESE, Pittsburgh, Pa. Filed July 24, 1882. (No model.) Issued Dec. 19, 1882.

269,377. FIRE ESCAPE. VITAL BESSIER, New York, N. Y. Filed April 28, 1882. (No model.) Issued Dec. 19, 1882.

269,378. MACHINE FOR MAKING CARBON OR GAS BLACK. ERASTUS R. BLOOD, Erie, Pa. Filed Nov. [illegible] (No model.) Issued Dec. 19, 1882.

269,379. CONDUIT FOR ELECTRIC WIRES. [illegible] BOYER, Lebanon, Pa. Filed Feb. 16, 1882. (No model.) Issued Dec. 19, 1882.

269,389. MANUFACTURE OF ARTIFICAL MARBLE FOR BATH TUBS, &c. REESE P. COUGHLIN, Cincinnati, Ohio. Filed Sept. 23, 1882. (No model.) Issued Dec. 19, 1882.

269,391. STAND AND TANK FOR VAPOR STOVES. JOHN F. DANIELS, Decatur, Ill. Filed Sept. 26, 1882. (No model.) Issued Dec. 19, 1882.

269,409. OIL STONE HOLDER. FRANK H. GOWELL, Boston, Mass. Filed Aug. 16, 1882. (No model.) Issued Dec. 19, 1882.

269,414. PUMP. JESSE A HEYDRICK, Barnhart's Mills, Pa. Filed July 14, 1832. (No model.) Issued Dec. 19, 1882.

269,417. ELECTRIC ARC LAMP. ALFRED G. HOLCOMB, Danielsonville, Conn., assignor to Daniel K. Colborn, New York, N. Y. Filed Feb. 21, 1881. (No model.) Issued Dec. 19, 1882.

269,431. TUBULAR LAMP. JOHN KRUMMENAUER, Brooklyn, assignor to Frederick Dietz, New York, N. Y. Filed Aug. [illegible] 1882. (No model.) Issued Dec. 19, 1882.

269,440. HYDRANT. WILLIAM MCNAMARA, Cleveland, Ohio. Filed June 24, 1882. (No model.) Issued Dec. 19, 1882.

269,448. ROTARY PUMP. JOSEPH MENGE, New Orleans, La. Filed June 21, 1882. (No model.) Issued Dec. 19, 1882.

269,458. ELECTRIC ARC LAMP. WILLIAM S. PARKER, New York, N. Y. Filed June 5, 1882. (No model.) Issued Dec. [illegible] 1882.

269,458. SAFETY STEAM BOILER. GEORGE T. PIMM, Baltimore, Md. Filed Sept. 11, 1882. (No model.) Issued Dec. 19, 1882.

269,466. LAMP. WILLIAM B. ROBINS, Cincinnati, Ohio, assignor to the Alba Light Company, same place. Filed June [illegible] 1882. (No model.) Issued Dec. 19, 1882.

269,470. ELECTRIC CABLE. WILLIAM H. SAWYER, Providence, R. I. Filed Sept. 27, 1882. (No model.) Issued Dec. 19, 1882.

269,480. COMPOSITE PAVEMENT. PETER STUART, Edinburgh, County of Mid-Lothian, Scotland. Filed May 22, 1882. (No model.) Issued Dec. 19, 1882.

469,489. APPARATUS FOR HEATING RAILWAY CARS. MAURICE J. WALSH, New York, N. Y., assignor, by mesne assignments, to Louis Fitzgerald, same place. Filed July 20, 1882. (No model.) Issued Dec. 19, 1882.

269,512. AUTOMATIC FEED WATER REGULATOR FOR STEAM-BOILERS. JOHN CHRISTMAN, Syracuse, N. Y. Filed Sept. 12, 1882. (No model). Issued Dec. 26, 1882.

269,523. PUMP CYLINDER. WILLIAM H. HOLCOMBE and CLIFFORD A. HOLCOMBE, Beloit, Wis. Filed Aug. 7, 1882. (No model.) Issued Dec. 26, 1882.

269,526. APPARATUS FOR SUSPENDING, RAISING and LOWERING ELECTRIC LAMPS. CHARLES C. JENNINGS, Buffalo N. Y., assignor of one-half to James Adams and John F. Moulton, same place. Filed May 4, 1882. (No model.) Issued Dec. 26, 1882.

269 534. SAFETY-VALVE. ALEXANDER ORME, Chicago, Ill. Filed Aug. 7, 1882. (No model.) Issued Dec. 26, 1882.

269,549. DRAIN-PIPE TURNER. WILLIAM W. STICKNEY, St. Louis, Mo. Filed April 18, 1882. (No model.) Issued Dec. 26, 1882.

269,559. ELECTRIC CURRENT METER. ALEX BRENSTEIN, Boston, Mass. Filed Oct. 4, 1882. (No model.) Issued Dec. 26, 1882.

269,568. CONDUIT FOR ELECTRICAL CONDUCTORS. WILLIAM B. ELTONHEAD, Philadelphia, Pa., assignor to Ed. Y. Eltonhead, same place. Filed Aug. 17, 1881. (No model.) Issued Dec. 26, 1882.

269,577. TINNER'S FIRE-POT. JOHN S. HULL, Baltimore, Md. Filed Oct. 18, 1882. (No model.) Issued Dec. 26, 1882.

269,586. FEED-WATER HEATER. EDWARD KENDALL, Cambridgeport, Mass. Filed Aug. 30, 1882. (No model.) Issued Dec. 26, 1882.

269,605. DYNAMO-ELECTRIC MACHINE. ELIHU THOMSON, New Britain, Conn., assignor to the American Electric Company, same place. Filed Sept. 18, 1882. (No model.) Issued Dec. 26, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Registrars will please notify box 578, Washington, D. C., when their supply of blank Postals is running low, in order that they may be kept supplied.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

Notes and Abstracts.

Of an urban population of 6,474,986, there died during the week ending May 5, 2,751 persons, which is equivalent to an annual death rate of 22.0, a decrease from the average for the preceding four weeks, *viz.*, 23.5.

For the North Atlantic cities the rate was 20.3; for the Eastern cities, 24.3; for the lake cities, 19.0; for the river cities, 18.1; and in the Southern cities, for the whites, 18.3, and for the colored, 35.8.

Of the whole number of deaths, 35.3 per cent. were under five years of age, an increase on the average for the preceding four weeks, *viz.*, 33.2.

Accidents caused 3.4 per cent. of all deaths.

Consumption caused 16.1 per cent. of all deaths. In the North Atlantic cities it caused 15.4; in the Eastern cities 16.4; in the lake cities 14.1; in the river cities 19.7, and in the Southern cities, for whites, 12.0, and for colored 19.1 per cent.

Croup caused 1.1, diarrhœal diseases 2.0, and diphtheria 4.1 per cent. of all deaths. In the Southern cities diarrhœal diseases 6.6 per cent. of all deaths In the North Atlantic cities diphtheria caused 4.0; in the Eastern cities 4.2; in the lake cities 7.0, and in the river cities 3.0 per cent, while in the Southern cities it caused none.

Typhoid fever caused 1.2, malarial fever 1.0, and scarlet fever 3.1 per cent. of all deaths. The highest rate from typhoid was in the lake cities (2.2), and the lowest in the Eastern cities (0.7). The

Digitized by Google

highest rate from malarial fever was in the Southern cities, for the whites, (3.5). The highest rate from scarlet fever was in the Eastern cities (4.1).

Pneumonia caused 10.9, congestion of the lungs 1.0, and acute bronchitis 3.6 per cent. of all deaths. In the North Atlantic cities pneumonia caused 12.5; in the Eastern cities 12.3; in the lake cities 8.7; in the river cities 9.0; and in the Southern cities, for whites, 6.6, and for colored 8.3 per cent.

Measles caused 1.3, small-pox 1.6, and whooping cough 0.9 per cent. of all deaths. In the river cities the rate of whooping cough was 4.2 per cent. of all deaths. The chief mortality from small-pox continues to be in the City of New Orleans.

FULTON, ILL.—Dr. C. W. Clendenin reports the continued prevalence of measles.

PITTSBURGH, PA.—Dr. W. Snively reports one new case of small-pox.

BOSTON, MASS.—C. E. Davis, Jr., reports 25 new cases of diphtheria, 17 of scarlet fever, four of typhoid fever and two of typhus fever.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports 1,366 insane patients remaining under treatment on May 5. During the week which ended on that day there were seven admissions, two discharges and two deaths.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports seven new cases of diphtheria and 30 of scarlet fever. On May 5 there remained under treatment in the city 12 reported cases of the former disease and 62 of the latter.

DETROIT, MICH.—Dr. O. W. Wight reports 27 cases of diphtheria and 17 of scarlet fever.

PROVIDENCE, R. I.—In his report for the week ending May 5, Dr. E. M. Snow has the following remarks: "The new cases of typhoid fever have almost entirely ceased, and the health of the city seems to be as good as the average for the season. Very erroneous statements have been industriously circulated in papers of other cities in regard to the health of Providence. The truth is that, generally for a year past, the rate of mortality has been less in Providence than in Boston or New York. In the last month, April, the number of deaths in Providence was larger than in any other month for a year, except November, and the annual *rate* of mortality was 23,33 in each 1,000 of the population; but the rate in Boston in the same month was 26.32 in each 1,000, according to the report of the City Registrar of Boston.

BALTIMORE, MD.—The return of the Board of Health for the week ending May 5, shows a total of 156 deaths; males 84, females 72; under five years 51, over 60 years 26. The annual death rates as calculated by the local authorities are, for the whole population 19.83, for the white 17.28, and for the colored 34.66. Small-pox caused six deaths, measles one, scarlet fever six, typhoid fever one, malarial one, croup two, diphtheria five, diarrhœal diseases two, erysipelas two, puerperal fever one, consumption 29, bronchitis three, pneumonia 13, cerebro-spinal meningitis three and violence six.

MICHIGAN.—During the week ending April 28 the diseases which mainly prevailed in the State were, rheumatism, neuralgia, bronchitis, intermittent fever, consumptiom, tonsilitis, influenza and pneumonia. Diphtheria was reported present at 10 places, scarlet fever at 18 places and measles at 22 places. As Dr. Baker makes no mention of small-pox it is inferred that the State continues free from this disease poison.

NEW HAMPSHIRE.—Dr. C. W. Chamberlain, Secretary State Board of Health reports that, during the month of March, acute lung diseases and influenza prevailed often almost in an epidemic form. Malarial diseases generally have been much less frequent than during last year. Scarlet fever has not been as prominent as it was earlier in the year; yet measles, scarlet fever and whooping cough are each rather more prevalent than diphtheria, except in a few localities. Erysipelas has been reported rather mere frequently than usual. "It is thought probable that a proper law could now be passed regulating the isolation of persons having contagious diseases of the types especially that readily become epidemic, and regulating attendance at schools of persons from towns where a case of such disease existed, although it was rejected a year ago."

KNOXVILLE, TENN.—Dr. S. B. Boyd, Secretary of the Board of Health, has transmitted his report for 1882, to the mayor and aldermen. We make some extracts from his statistics. The population of 17,151—white 12,643, colored 4,508—is taken from the enumeration by the Standard Directory Company, August 1, 1882. There were 365 deaths in the city and suburbs; white 225, males 126, females 99; colored 140, males 60, females 80. In calculating the rate the deaths of 41 non-residents are omitted. The rate for the whole population was 18.89, for the white people 15.89, and for the colored people 27.28. These rates are in excess of those of last year, and the infant mortality which was 32.11 per cent. of the total in 1881 was increased in 1882 to 39.45 per cent. There were 201 cases of scarlet fever reputed, 33 of which proved fatal; 53 of diphtheria, with 11 fatal, and about 300 of typhoid fever, with 26 fatal. Cholera infantum caused seven deaths, consumption 47, acute bronchitis four, croup four, pneumonia 25, dysentery three, whooping cough three, measles one, small-pox six, violence 7.

ONTARIO, CANADA.—The *Bulletin* for the week ending April 28 reports as the most prevalent diseases bronchitis, anæmia, neuralgia and influenza Intermittents and diarrhœas are advancing. Measles constitutes 5.7 per cent. of the observed diseases. Mumps has receded considerably and scarlet fever has decreased. Cerebro-spinal meningitis has appeared in one of the districts.

RIO DE JANEIRO.—Consul-General C. C. Andrews reports yellow fever increasing and declared epidemic during the week ending March 31. Not including reports from the Hospital Santa Isabel there were 73 deaths reported from this fever in a total mortality of 353 which occurred during the week. The shipping continues free from the infection. Small-pox caused eight deaths, typhoid fever five, typhus fever two, pernicious fever 15 and consumption 45; population 330,000.

GEORGETOWN, DEMERARA.—Consul Figyelmesy sends a mortality report for March, showing 224 deaths in a population of 47,175. Of these 125 occurred in hospitals and other public institutions, and two among the shipping, while 48 were infants under one year, and 49 persons in the city over one year of age. Diarrhœa caused 24 deaths, consumption 31, leprosy six, croup one, erysipelas one, puerperal fever one and acute lung diseases four.

NEW AMSTERDAM, DEMERARA.—Consul Figyelmesy sends also a report from New Amsterdam for March, showing 33 deaths in a population of 8,124. Of the decedents in the city seven were under one year, and six were over that age; the remaining twenty deaths occurred in the public institutions. No disease was specially prevalent.

ENGLAND.—The return of the Registrar-General for the week ending April 21 shows an average rate of mortality equal to 23.0 per 1,000 annually in the 28 large towns. Bradford gave the lowest rate, 16.3, and Blackburn the highest, 30.8. No death was referred during the week to any of the principal zymotic diseases in Huddersfield. The highest rates from whooping cough were in Derby, Manchester and Hull, from measles in Manchester, and from scarlet fever in Birkenhead. Diphtheria caused 19 deaths in London, two in Portsmouth, two in Birmingham and two in Preston. Small-pox caused two deaths in London, two in Wolverhampton, one in Leeds, and one in Newcastle-upon-Tyne.

London.—Births 2,607; deaths 1,755; the former were 97 below, while the latter were 33 above the average numbers in the corresponding weeks of the last ten years. Annual rate 23.2 Small-pox caused two deaths, measles 46, scarlet fever 21, diphtheria 19, whooping cough 40, typhoid fever 10, and diarrhœa and dysentery 13.

SCOTLAND.—Consul J. A. Leonard, transmits the return of the Registrar-General for the week ending April 21, a summary of which is given in our table. The average death rate was 27.5 per 1,000, or 4.3 above that of the corresponding week of last year. Aberdeen recorded the lowest mortality, 16.7; and Glasgow the highest 33.8. The prevailing epidemics were whooping cough and measles, deaths from measles being most frequent in Glasgow (27) and from whooping cough in Glasgow (21) and Dundee (12). There were some diminution in the number of deaths from acute lung diseases.

Edinburgh.—Total deaths 91; rate 20.1. No death was registered from small-pox, scarlet fever, typhoid fever or diarrhœal diseases. Measles caused one death, diphtheria two, whooping cough two, acute lung diseases 20 and violence one.

SCOTLAND.—The Registrar-General's returns for the months of February and March have been received:

During February 3,310 children were born in the eight principal towns; of these 1,685 were males and 1,625 females. Illegitimate births formed 8.4 per cent. of the whole. The deaths of 2,580 persons were registered of whom 1,253 were males and 1,287 females. This mortality is 57 below the average for the month during the last ten years. The rates were as follows: Aberdeen 18 per 1,000, Leith 20, Edinburgh 21, Perth 23, Dundee 26, Greenock 27 and Glasgow and Paisley 28. Deaths of children under five years constituted 40.3 per cent. of the total. Whooping cough which was the most fatal epidemic caused 196 deaths or 7.6 per cent of the whole; in Dundee, Glasgow and Aberdeen the deaths from this disease were respectively 14.6, 8.4 and 7.9 per cent. of the total deaths. Fever caused 41 deaths of which 10 were registered as typhus. Scarlet fever caused 44 deaths, croup 29, diarrhœa 28, measles 26, diphtheria 26, metria four, dysentery one, acute lung diseases 646 or 25.0 per cent, consumption 259 or 10.0 per cent. and violence 73 of which three were suicidal.

During March the births numbered 3,540; males 1,828, females 1,712; illegitimacy 7.4 per cent. The deaths amounted to 2,908; males 1,459, females 1,449. This mortality is 19 above the average, rates:—Aberdeen and Edinburgh 20 per 1,000, Perth 22, Paisley 24, Greenock 26, Leith 29, Dundee 30 and Glasgow 33. Deaths of children under five constituted 41.1 per cent. of the total; in Perth these deaths formed only 24 per cent., in Leith 46 per cent. Whooping cough continued fatal having caused 218 deaths or 7.5 per cent. of the whole mortality. In Dundee this percentage amounted to 12.8, in Perth 12.1 and in Paisley 9.6. Fever caused 53 deaths, 15 of which were attributed to typhus. Measles caused 83 deaths, 74 of which occurred in Glasgow. Diarrhœa caused 37 deaths, scarlet fever 35, diphtheria 32, croup 26, metria seven, dysentery two, acute lung diseases 755 or 26.0 per cent. of the total, consumption 306 or 10.5 per cent. and violence 90, of which seven were suicidal.

IRELAND.—Consul A. B. Wood sends the return of the Registrar-General for the week ending April 14. For a summary of this return see table on preceding page.

DUBLIN.—Deaths 216 or 32.1 per 1,000. No death was recorded from small-pox, measles, scarlet fever or diphtheria; typhoid fever caused six deaths, typhus three, diarrahœa two, whooping cough five, consumption 31, acute lung diseases 57, and violence three. Population 349,685.

BELFAST.—Deaths 130 or 31.6 per 1,000. No death was reported from small-pox or measles. Typhoid fever caused one death, and typhus one, scarlet fever eight, whooping cough six, diphtheria two, diarrhœa one, consumption 27, acute lung diseases 35, and violence two. Population 214,022.

Consul Wood sends also the returns for the week ending April 21.

DUBLIN.—Births 288, deaths 241; equal to annual rates of 42.8 and and 35.8. No death was registered from small-pox, measles or diphtheria. Scarlet fever caused one death, typhus four, whooping cough 11, typhoid two, diarrhœa and dysentery four, consumption 36, acute lung diseases 63 and violence six.

BELFAST.—Births 124, deaths 107; equal to the rates 30.1 and 26.0. No death was registered from small-pox, measles, typhus or diphtheria. Scarlet fever caused 10 deaths, whooping cough one, typhoid fever one, diarrhœa and dysentery three, consumption 19, acute lung-diseases 35, and violence one.

IRELAND.—During the year 1882, there were registered [illegible] and 21,886 deaths in the 16 urban sanitary districts. The former number is equal to a rate of 29.7 per 1,000 of the aggregate population of 843,553 inhabitants, and the latter to a rate of [illegible]. Small-pox caused 97 deaths, of which 82 occurred in Belfast and [illegible] in Waterford. Measles caused 815 deaths, scarlet fever [illegible], typhus [illegible], whooping cough 206, diphtheria 74, ill defined fevers [illegible], typhoid fever 224, diarrhœa and dysentery 677, consumption [illegible], acute lung diseases 4,722 and violence 397.

DUBLIN.—In the city and suburbs the births numbered [illegible] and the deaths 9,461, equal to the respective rates of 28.9 and [illegible]. No death occurred from small-pox. Measles caused 563 deaths, scarlet fever 35, typhus 83, whooping cough 81, diphtheria 31, typhoid fever 132, diarrhœa and dysentery 238, consumption 1,144, acute lung diseases 2,068, and violence 232.

BELFAST.—Births 6,820, deaths 5,365; equal to the rates of [illegible] and 25.8. Small-pox caused 82 deaths, measles 111, scarlet fever [illegible], typhus 55, whooping cough 65, diphtheria 25, typhoid fever [illegible], diarrhœa and dysentery 218, consumption 799, acute lung diseases [illegible] and violence 95.

PARIS, FRANCE.—During the week ending April 12 there were registered 1,270 deaths, equivalent to an annual mortality rate of [illegible]. Typhoid fever caused 25 deaths, small-pox nine, measles [illegible], scarlet fever four, whooping cough nine, diphtheria and croup 35, erysipelas eight, puerperal fever nine, consumption 229, acute bronchitis [illegible], pneumonia 147, and violence 43.

On April 8 there remained under treatment in the hospitals [illegible] cases of small-pox, 243 of typhoid fever, and 32 of diphtheria.

During the year 1882 there were 58,702 deaths reported, of which 17,411 were of children under five years of age. Consumption caused 10,342 deaths. Epidemic diseases caused 5,579 deaths, [illegible] typhoid fever 3,352, small pox 661, measles 1,018, scarlet fever [illegible], diphtheria 2,390. The suicides numbered 767, males 612 and females 155. Lastly 5,170 still births were registered.

RHEIMS, FRANCE.—Consul John L. Frisbie reports 62 deaths as having taken place during the week ending April 7; males 35, females 27; under five years 39, over 60 years nine. Annual rate [illegible]. No death was reported from small-pox, scarlet fever, typhoid fever, whooping cough, erysipelas or puerperal infection. Croup and diphtheria caused five deaths, measles four, pneumonia five, bronchitis four, pleurisy two, consumption four, and violence two.

STOCKHOLM, SWEDEN.—Consul Nere A. Elfwing sends report for the week ending March 31. The deaths numbered 86; males [illegible], females 38; under five years 30, over 60 years 20. Annual rate [illegible]. Measles caused one death, scarlet fever four, whooping cough one, croup and diphtheria four, diarrhœa four, consumption 16, pneumonia 14, bronchitis one and violence three.

During the week ending April 7 cases of disease were reported as follows: Small-pox, puerperal fever, cerebro-spinal meningitis, [illegible], dysentery and epidemic diarrhœa none, measles 19, scarlet fever [illegible], typhus one, erysipelas five, whooping cough ten, diphtheria [illegible], croup one, typhoid fever eight, tonsilitis 14, pneumonia 25, pleurisy one, bronchitis 85 and diarrhœa 24.

COPENPAGEN, DENMARK.—During the week ending April [illegible] deaths occurred, of which number 58 were of children under five years of age. This mortality is equal to an annual rate of 24.43. No death occurred from measles, scarlet fever or erysipelas. Diphtheria caused one death, croup three, whooping cough five, typhoid fever two, diarrhœa two, puerperal fever one, consumption 11, pneumonia 11, pleurisy one, acute bronchitis eight, and violence one.

During the same week cases of disease were reputed as follows: Small-pox one, measles one, scarlet fever 12, diphtheria 14, croup one, whooping cough 77, typhoid fever six, dysentery one, diarrhœa 83, erysipelas 25, puerperal fever seven, bronchial catarrh 334, pneumonia 62 and tonsilitis 155.

BRUSSELS, BELGIUM.—During the week ending April 7, there occurred in Brussels and its suburbs 284 births and 249 deaths, equal respectively to annual rates of 35.5 and 32.3 per 1,000. The deaths of children under five years numbered 81. No death was registered from croup or scarlet fever. Diphtheria and whooping cough caused one death each; measles and typhoid fever four each, small-pox six, diarrhœal diseases 13, bronchitis and pneumonia 41 and consumption 36.

VIENNA, AUSTRIA.—Consul-General Weaver reports 538 deaths, equivalent to an annual rate of 37.3 per 1,000 as having been registered during the week ending April 7. Small-pox caused two of the deaths, scarlet fever two, diphtheria three, whooping cough eight, typhoid fever two, consumption 147, and acute lung diseases 106. Of the deaths 190 occurred in children under five years of age.

ST. PETERSBURG, RUSSIA.—Consul Edgar Stanton reports 730 deaths as having occurred during the week ending March 31; males 402, females 328; under five years 231, over 60 years 96. Population 929,525. Six deaths are reported from small-pox, 45 from fevers, of which two are indicated as from typhus, 15 from recurrent fever, 25 from typhoid and three from typhoid without specific form. On April 1 their remained under treatment in the hospitals 1,212 cases of fever, 28 of small-pox and 1,254 of venereal disease.

BOMBAY, INDIA.—Consul B. F. Farnham transmits reports for the weeks ending March 20 and 27. During the former period there were 619 deaths, or 165 more than during the week ending March 21, 1882, and 135 more than the mean of the corresponding period in the past five years. There were 113 deaths from remittent fever. One death from cholera was reported. There was a slight falling off in the number of deaths from small-pox, 123 being reported, as compared with 131 in the previous week. Acute lung diseases caused 66 deaths, diarrhœa 17 and dysentery 11.

During the latter week the deaths numbered 511, or only four more than the mean of the corresponding weeks in the previous five years. The annual rate calculated from this mortality was 31.28. Remittent fever caused 75 deaths, acute lung diseases 78, diarrhœa 29 and dysentery 13. Small-pox shows an inclination to decline, as only 93 deaths were reported, as compared with 123 during the preceding week.

STATE BOARD OF HEALTH.

The New York State Board of Health held its annual meeting at the capital, on May 9. Present were Dr. Edward M. Moore, president; Hon. Erastus Brooks, Dr. J. Savage Delavan, Dr. William M. Smith, Dr. James G. Hunt, Attorney General Russell, and Dr. Elisha Harris, secretary. After the reading of the minutes, a complaint of a source of malaria brought by a delegation from Fort Edward was discussed and referred to the committee on drainage, sewerage and topography. The election of officers resulted in the unanimous re-appointment of Dr. Edward M. Moore as president, and Dr. Elisha Harris as secretary. The standing committees of last year were continued. The finance committee reported that the finances were in a sound condition. The committee on stench nuisances urged the prompt suppression of the Kill-von-Kull nuisance opposite Staten Island. An inspector was allowed the committee to enforce executive orders against the premises of all refineries in the Newtown creek region.

Dr. Smith pointed out the importance of increased restrictions upon the sources of infection through emigrants and emigrants' clothing. Two emigrant-train inspectors will be employed by the Board's sub-committee. Copies of the Board's opinion with regard to the national Board of Health were directed to be sent to the President of the United States and the Secretary of the Treasury. The investigation of preventable diseases was ordered to be continued throughout the State. Accordingly, the necessary means to continue the work were voted.

The drainage work on the Genesee Valley canal was reported complete. Under the head of increased means for inspecting dangerous illuminating oils, the Board ordered the work prosecuted to the extent of its resources, and an additional inspector was ordered to be appointed for the western part of the State, and a communication was directed to be sent to all the district attorneys of the State concerning the strict enforcement of Chapter 292 of the Laws of 1882. The Board ordered its adherence to the principles involved in the recent law of Congress for the prevention of the adulteration and sale of adulterated teas, and approved of the means by which the first cargo of this adulterated tea had been seized and confiscated under this law.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it eaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Proposals.

PROPOSALS FOR FUEL, FORAGE AND STRAW.

DEPOT QUARTERMASTER'S OFFICE,
HOUSTON ST., COR. GREENE, NEW YORK CITY, *May* 1, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, on the 31st day of May, 1883, at which time and place they will be opened in presence of bidders, for furnishing and delivering Fuel, Forage and Straw required at *New York City, Willet's Point, N. Y. H.*, and *David's Island, N. Y. H.*, during the fiscal year ending June 30, 1884.

The Government reserves the right to reject any or all proposals, or to accept as may be most advantageous to the Department.

A preference will be given to articles of domestic production, conditions of price and quality being equal, and such preference will be given to articles of American production produced on the Pacific coast to the extent of the consumption required by the public service there.

Blank proposals and printed circulars stating the kind and estimated quantities required at each post, and giving full information as to the manner of bidding, conditions to be observed by bidders, and terms of contract and payment will be furnished on application to this office.

Envelopes containing proposals should be marked:—"Proposals for Fuel, Forage and Straw," and be addressed to the undersigned.
HENRY C. HODGES, *Lt.-Col. and D. Q. M Gen'l, U. S. A.*

NOTICE TO CONTRACTORS.

The Board of Commissioners of Porter County, Indiana, will receive proposals until two P. M., May 24, 1883, for the erection of a Court House in the city of *Valparaiso*. The plans and specifications can be seen at the Auditor's office in Valparaiso, and at the office of J. C. Cochrane, architect, No. 78 Ashland Block, corner Clark and Randolph streets, Chicago. Contractors can obtain printed instructions as to requirements and form of proposals, upon application to the auditor or architect.

[Signed] L. P. SCOTT, N. PICKRELL, F. BURSTROM, } *Board of Commissioners.*

[Attest] W. E. BROWN, *Auditor Porter County.*

PROPOSALS FOR CONSTRUCTION OF POST HOSPITALS.

OFFICE OF CHIEF QUARTERMASTER, DEPARTMENT OF THE EAST,
GOVERNOR'S ISLAND, N. Y. H., *May* 11, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, New York time, on the 31st of May, 1883, at which time and place they will be opened in the presence of bidders, for the construction of a twelve bed hospital, at *Fort Schuyler, N. Y. H.*, in accordance with plans and specifications, which can be seen at the office of the undersigned.

One copy of this advertisement should be securely attached to each triplicate proposal, and be mentioned therein as comprising a part of it.

Blanks for proposals, and information as to the manner of bidding, etc., can be obtained at this office. Proposals must be accompanied by a bond, with two sureties, in the sum of two hundred dollars. A proposal not accompanied by such a bond will not be considered.

Envelopes containing proposals should be marked "Proposals for construction of Post Hospital," and addressed to the Chief Quartermaster, Department of the East, Governor's Island, N. Y. H.

The Government reserves the right to reject any or all proposals.
C. G. SAWTELLE,
Deputy Quartermaster General, U. S. A., Chief Quartermaster.

For information as to public work to be done in Kansas City, Mo., during the present season, address,
W. B. KNIGHT, *City Engineer.*

The Secretary of the Navy will receive sealed proposals until noon July 2, 1883, for the construction by contract of three steam crusiers and one dispatch boat.

Designs, specifications and full information may be had by addressing WM. E. CHANDLER,
Secy. of Navy, Washington, D. C.

For furnishing 500,000 granite paving blocks, more or less, will be received until May 21, 1883. For information, address,
Maj. G. J. LYDECKER, *Washington, D.C.*

For the erection of a soldiers' monument until August 1st. Address S. E, Merwin, New Haven, Conn.

For building a brick sewer will be received until May 22d by C. S. Brackenbridge, city civil enginner, Forte Wayne, Ind.

For performance of following work: On Great American Railway between Pugwash and New Glasgow, N. S., a distance of about 70 miles, graduation of road-bed, bridge masonry, wooden bridges, and iron bridges. For further information address Chas. L. Snow, Superintendent of Construction, Pugwash, Nova Scotia.

Proposals for Building Material will be received until May 23, 1883, by C. B. MOORE, *Supervisor N. Y. State Prison, Trenton, N. Y.*

Proposals for the erection of a wrought iron bridge will be received until May 21 by GEO. W. VANALTA, *Chairman, Warden's office, Court House, Trenton, N. Y.*

Proposals for new Bank Building will be received by First National Bank, Newtown, Pa., until May 29, 1883. Specifications of
J. H. HOBB & SON, *Architects,*
520 Walnut Street, Philadelphia, Pa.

Proposals will be received at the office of the Superintendent of the Institution for the Deaf and Dumb, at Columbus, O., till 8 o'clock, A.M., of Saturday, June 9, for the following work: For reconstructing the heating apparatus now in use; for constructing new cold air ducts; for completing ventilating or foul air ducts.

Proposals will be received until 12 o'clock Wednesday, June 6, 1883, for furnishing and laying about 90,000 feet pipe, assorted sizes, also fittings, hydrants and valves; also pumping machinery, water wheel, etc., also for stone building. Specifications can be had of
H. M. MOULD,
Sec'y Board of Water Commissioners, Keesville, N. Y.

THE "JUNIOR" ECLIPSE
Pipe Cutting Machine.
This tool meets the requirements of those who have use for a Screwing Machine light enough to be readily carried about, sufficiently powerful in its gearing (18 to 1) to work easily, and strong enough to bear rough usage. All these points, with the very important one of MODERATE COST, are to be found in the "JUNIOR" ECLIPSE MACHINE.
It will cut off and thread Pipes from ¼ to 2 inches inclusive; can be erected on any fence, box or plank in five minutes, by simply boring two ¾ holes, and weighs complete, about 125 pounds. It has no complicated parts and nothing to break or get out of order, and will do the work of a tool costing twice its price.
We offer it, as also the large size "Eclipse" cutting up to 4 inch Pipes, with the understanding that if not found satisfactory after a fair trial, it may be returned to us within thirty days, and the purchase money will be refunded.
PRICE, Complete with Dies ¼ to 2 inches, $60.00.

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

MEYER, SNIFFEN & CO.'S

No. 1

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER WATER-CLOSET.

With the Cistern from which it is supplied, a pair of Brackets, the Floor Lever Chain and necessary fittings, except the lead pipe and trap.

The names of some of the parties using them and those having them for sale with full descriptive circulars, will be mailed on application to us.

MEYER, SNIFFEN & CO.'S No. 3 A

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER'S *ARTISAN HOPPER*,

WITH IMPROVED FLUSHING RIM.

FLUSHED FROM OUR

No. 2 A Preliminary Flush Cistern.

PATENTED.

Complete with seat, and all attachments ready for putting up, except lead pipe.

This is an admirable arrangement for Stores, Tenement Houses, Servants' Use, or any public place, where people neglect to lift the handle or properly flush an ordinary Water Closet.

This Hopper is of Earthenware, of novel shape, and with improved flushing rim, when supplied and fitted up as shown herein, always clean. When seat is depressed, a valve is raised, and Service Box filled with water, to extent of two and a half gallons. When seat is relieved of weight, the valve before referred to is closed, another one opened, when the contents are suddenly delivered through an 1¼ pipe to the Hopper, carrying all solid matter through the trap.

By a valuable improvement in the construction of our No. 2 Cistern—which is patented—a preliminary flush of half a gallon is secured, which thoroughly wets the entire inner surface of the hopper. The trickle is dispensed with, thus economizing the use of water, and very much better results are secured.

In ordering, describe as "*Meyer, Sniffen & Co.'s No. 3 A Water Closet Apparatus.*"

These Hellyer Hoppers are sold with various flushing apparatus, their efficiency largely depending on the selection. It is for this reason that we never sell the Hoppers unless we are satisfied that the flushing arrangements are suited for the particular duty required.

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, it is designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and examine them.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

NEW DIRECT ACTING

STEAM PUMP.

For Every Imaginable Service.

A large number of these Pumps have been put on every variety of service during the past three years, with the best results.

The Pump is simple in construction, having a smaller number of moving parts than others.

It will work equally well under a light or heavy pressure, at a higher speed, with less noise than any other steam pump, and is suited for every variety of service.

All Pumps are tested at the factory under all possible speeds and pressures.

We are prepared at present to furnish all the leading sizes, and are constantly making additions to our patterns.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted. Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

Mott's Porcelain Lined French Baths,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

88 & 90 Beekman Street, NEW YORK.

Shows Bath with Overflow and Waste Coupling—Plug and Overflow Strainer being Nickel Plated and Plug furnished with Rubber Stopper.

Shows Bath with Nickel Plated Cocks, Bottom Supply and "McFarland" Waste Fixtures complete. Fixtures furnished Silver Plated to order.

FIVE SIZES, viz: - - - 4, 4½, 5, 5½ and 6 feet.

The superiority of our Porcelain-lined Baths over all kinds of metal tubs for good work is a well-established fact, as their general use within the last few years throughout the country will prove. Not only are they specially adapted for fine private work, but their durability, cleanliness and moderate price recommend them for general use in Hotels and Public Institutions. The Bath with our Fixtures as shown, is a very handsome, compact and complete arrangement. There are many advantages in the above mode of Supply and Waste, other than its doing away with the lead connections (the entire fixtures being of Brass); for instance, the water is admitted near the bottom of the Tub, thereby doing away with the possibility of servants drawing water and chipping or otherwise destroying the Tub with pails or buckets. Then the Hot and Cold Water is mixed as it comes into the Tub, which prevents the bath-room filling with steam; it also fills the Tub without noise. The "McFarland" Waste makes a very thorough and complete job, and does away with Plug and Chain.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, ON APPLICATION.

All our Sanitary Specialties are fitted up with water attached, and may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

SANITATION AND PATERNAL GOVERNMENT.

Under the title of "economy in sanitation," Capt. Douglas Galton recently read a paper before the Society of Arts, in which he advocated a great extension of the powers and duties of local authorities in relation to sanitary matters, and more especially to the subjects of house drainage and the providing of healthy habitations for the poor. Taking the ground that house drains are a part of the sewerage system of a town, and that it is to the interest of the whole community that each dwelling should have good sanitary appliances, he concludes that local authorities should not stop at the function of inspection, but "should assume the function of inspecting and reconstructing house drains at the expense of the owner or occupier." It is not quite clear whether the consent of the owner or occupier is to be obtained or not. It is argued that "the work would then be executed upon a uniform system and under general contracts; the greater part of the work being nearly uniform in character would enable both the contractor and his workmen to become experienced in the details, and thus the work would be done better, cheaper and more systematically."

But Captain Galton goes further than this. He thinks that where private enterprise fails, the municipality should construct dwellings, and that the rents for these dwellings should be fixed on a scale to allow of their occupation by the very poor, and states that he advocates this, not at all as a philanthropic measure, but as a measure of sanitation, of economy, and of protection to the rest of the community. He says:

"We insist upon educating the children of the people, and we place the children during their school hours in airy, spacious rooms. But follow those children, who live in the more densly crowded parts of this city, to their homes in confined courts, without circulation of air; their playground in the court or street, often in the midst of refuse, and learning from the example of their parents, that the only comfortable place is the gin palace and the music-hall. It is not sufficient to content ourselves with giving education to this population; the education will be dangerous rather than beneficial if we allow the wretched dwellings which exist in so many parts of this metropolis to continue to exist. We have abolished the cesspools, which bred fever and intensified the plague of cholera; we must now abolish the wretched dwellings, which are moral cesspools, and which intensify moral disease by fostering crime and discontent. If the education which we now give so lavishly is to produce beneficial fruits, we must attend to the material comfort of the people as well as to their moral training. The provision of proper dwellings for the people is the natural complement of the measures which have been passed for the education of the people."

While we fully agree with Captain Galton as to the desirability of improving the habitations of the poor in our large cities, and also as to the necessity of perfecting systems of house drainage in order to keep the sewers free from offensive and dangerous matters, we have nevertheless grave doubts as to the expediency of the means which he proposes to secure these ends. How best to aid the poor without encouraging pauperism is one of the most difficult problems with which our modern civilization has to deal; but as municipal governments are now constituted, it seems certain that Captain Galton's plan would increase the very evils which he seeks to mitigate. As to the project of having a city contractor to do all the house plumbing in a city in accordance with orders to be given by official inspectors, who are under no obligations to regard the plans or wishes of the owners or occupants who are to pay the bills, it seems to us that the proposal carries its own condemnation.

Last week the mayor of this city sent to the Board of Aldermen a petition signed by some three thousand citizens, representing the wealth, public spirit and intelligence of the community, praying that the aldermen would reconsider their action in rejecting the nomination of Prof. Chas. F. Chandler for President of the Board of Health.

The petition set forth the importance of the nomination, on account of the extraordinary powers now intrusted to the Board of Health, and it declared that "the long and distinguished services of Prof. Chandler in the administration of sanitary laws, and his familiarity with all branches of sanitary science, conspicuously fit him for the position." This petition was returned to the mayor, and in such a manner, that it is evident that the Tammany members want no such man as Prof. Chandler in that position. If we were in the mayor's place we should send in Prof. Chandler's name each week that we held the office, or until confirmed, and allow these worthies to reject him, until they get tired of it. Unfortunately, however, the mayor is not disposed to take issue with these people, and we presume he will make another nomination. If a person in any way fit for the place is confirmed, it will be because the majority of the aldermen have been mistaken in the man. Our only hope is that they may be deceived.

PLUMBING IN A NEW YORK COMMERCIAL BUILDING.

The system of waste pipe ventilation employed in the job described below is substantially the same as that illustrated in THE SANITARY ENGINEER of August 24, 1882 (Vol. VI., pages 250 and 251), but the location of the fixtures in the present case occasions some interesting arrangements not found in the other. The building is located at No. 47 Leonard street. Mr. T. M. Clark of Boston was the architect, and Messrs. E. Duggan & Co. of this city did the plumbing, under the direction of the owners.

All the fixtures are contained in a small toilet room in the front of the basement, under the steps between the building and the street. (The iron columns shown in the plan support a portion of the front wall.) The floor of this room is raised about two feet eight inches above the surrounding basement floor, on a platform of brick and concrete. The sides inclosing it are of a single thickness of boards, and the top is open to admit light through the steps, as shown in the perspective view. The traps and pipes connected with the urinals are exposed on the outer side of the wall on which they are placed, as indicated by dotted lines in the perspective.

The iron drain pipes shown in the plan are laid in concrete trenches, covered with brick. Beneath the water closets the earth was excavated to a depth of about three feet, and the space filled with loose stones, which directly underlie the closet traps, with nothing between, so that in case of a leak or overflow from the closets, the water may soak away in the earth. The traps are easily accessible from the outside of the room without tearing up the floor or removing the closets. The drain from them passes out from the platform above ground and enters a five-inch pipe, which extends to the rear for a rain leader (five-inch, trapped). An independent four-inch branch is taken to the roof for ventilation alone.

The closets are hoppers, flushed from one cistern by a seat attachment, which produces a preliminary as well as final flush. The urinals are flushed periodically by a tilting basin holding about one gallon, or one-half gallon for each urinal. The supply is adjusted to flush every three minutes. The floor and wall about the urinals are of white marble. There is no foot drain or outlet in the slab in the floor below the urinal, an arrangement which the plumbers of this job believe to be of greater harm than good—claiming that ordinarily so little water enters them that the trap is unsealed most of the time, allowing foul odors to enter the room from the drain. Instead of the usual bent lead connection between the urinal outlets and the waste pipe, requiring a long cutting through the slab, and a shield to hide it, these have nickel-plated brass, flange-and-thimble, bent couplings, requiring only a circular hole through the slab.

The peculiarity of ventilation here employed consists in the provisions for ventilating the fixture side as well as the drain side of the traps. This is accomplished by connecting the waste pipes just below the fixtures with a heated flue, consisting of a ten-inch galvanized iron pipe extending up through the roof and containing the exhaust steam pipe. As steam is used the year round for running elevators, pumps, etc., the flue is always heated. The connections to this flue are of the following sizes: from water closets, 2-inch; from urinals, 1¼-inch, and from basins, 1¼-inch. The trap vents are two-inch from closets and urinals, and 1½-inch from sink and basin, to a three-inch vertical pipe running separately to the roof.

On complaint of a citizen residing in the neighborhood, the Board of Health recently caused an examination to be made of public school No. 32, on 35th street between Eighth and Ninth avenues. The inspector reported the earthenware drain pipe broken and a consequent accumulation of stagnant water and filth in the cellar. The case was referred to the Board of Education.

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XXI.

FORMS OF RADIATORS.

In the last paper my intention was to show that the nature of the metals composing heating surfaces had little or nothing to do with the amount of heat given off in ordinary warming practice, and that all metals from which heaters are ordinarily made, should be considered as equal, all other things being equal; but that every different form and modification had a value peculiar to itself, each of which may be expected to give a different result, all other things being equal.

The "flat coil," a coil for going against side walls, and composed of short lengths of horizontal pipe, connected at their ends by return bends, and doubling on themselves, one above the other, is the simplest and earliest form of radiator.

For convenience sake, and to suit the ordinary requirements of house furnishing, they seldom exceed four feet in length, and are increased

VIEW IN TOILET ROOM, SHOWING VENTILATION OF FIXTURES.

PLAN SHOWING LOCATION OF FIXTURES AND PIPES.

Digitized by Google

vertically to a great extent—20 to 24 pipes being sometimes used—to get the surface assumed or calculated to be sufficient.

In this form where there are many pipes—one over another—the under pipe is condensing the most water, because the air of the apartment comes in contact with it at a lower temperature than it can with any of the others, while at the same time the upper pipe is doing the least duty, because the air which reaches it comes to it warmed very highly, by being first in contact with the pipes which are lower down; and of all the intervening pipes, each has a different value, being greater near the bottom, lessening, in an undertermined ratio, with the upward progression. But should this coil be turned on its side instead of its edge—occupying a nearly horizontal plane—with each pipe slightly pitched in the direction of the flow of the steam, all the pipes will then have equal values as condensers, each condensing as much water as the lowest pipe did when against the wall.

Pipe in this form makes a good heater for direct radiation, but will not do so for indirect warming. Their comparative value is high, and when they do not exceed eight pipes in height,

No. 1.

may be considered to have as great an efficiency for a square foot of surface as any of the present styles of radiators.

In making these coils for ordinary use the fitter cannot always follow his judgment, but has to make a coil which will fit the space which is allotted to him. Usually he is limited in length, but in height he is supposed to go to what is necessary to get the required surface; but this frequently makes an unsightly shaped heater, as well as one which, according to its surface, is not doing the duty which was expected from it.

It is better to limit the height to about eight pipes; say, let ten be the maximum, and increase the surface by placing two sections of the coil

No. 2.

side by side, making what is called by the fitter a "two section coil."

In this form the two sections will not do double the work one section will do if placed alone, but the whole quantity of pipe in this shape will do more duty than if in the form of one high coil.

Three or more of these flat coils, placed side by side, and connected at the ends with "headers," or *manifold tees*, are called "box-coils"—presumably from their rectangular appearance, but more likely from the fact that they were formerly the principal style of indirect heater, which had to be boxed to make the heat available.

As a direct radiator without a screen, they were fair, but like the flat coil, gave the best result when the number of pipes in height was not great. Their mean efficiency was less than the flat coil for equal surfaces; but when placed at the side of a room and screened on the ends and outside, with a marble slab on top, their efficiency is low.

As an indirect radiator, they are fair, though the distance between the pipes is an objection to them with forced or exhausted ventilation. They give the best result when the air moves

No. 3.

over them at a velocity due solely to the rate of displacement caused by the heat they themselves communicate to the air.

In low flat box coils, say 4 to 6 high, with forced currents, the air will pass through at comparatively low temperatures; but it must be borne in mind, that even should air be delivered at only 90° Fah., if sufficient of it is delivered to maintain the air of an apartment to say 72°, the result is, in a sanitary point of view, more salutary than when hot currents are admitted, which must be reduced in volume, to keep the temperature of the room within bearable limits—lengthening the time of the total change of the air.

With deep box coils (10 to 12) the air can be admitted sufficiently warm to suit ordinary conditions, giving a range of temperatures at the registers of from 110 to 130, varying with the pressure of the steam and the velocities of the air.

The box coil is fast becoming obsolete in consequence of improved heaters, which can be made at a much less cost per square foot of surface.

There are places yet, though, where it must be retained, noticeably where exhaust steam is used without much back pressure. For instance, when an engine is used for running a fan, the exhaust steam from the engine can be all used in a box coil, or a series of them in the mouth of the air duct just beyond the fan, in the direction the air is taking. This utilizes all the heat of the steam, which goes to the engine, and warms the air sufficiently to prevent freezing in the ducts further up, should water form in any of the piping, which could not run off.

The "wall coil"—a number of nearly horizontal pipes stretched along the walls of rooms, but connected at their ends by a "header" (instead of having return bends) with the pitch of all the pipes in the same direction—has a value equal to the flat coil for the same number of pipes in

No. 4.

height. The flat coil and the box coil may be looked upon as portable heaters, as by disconnecting them from the steam and return connections, they may be moved; but the wall coil is a fixture, and is built against the wall, usually following its contour and always turning some corners.

This style of coil is the best for an auxiliary heater for school houses.

When a school is warmed by indirect radiation for the purpose of insuring a positive change of air in a given time, it frequently happens that, though it may be considered very well ventilated, that it is not equably warmed; that the children sitting near windows or outside walls feel cold, though there are parts of the room which show comfortable temperatures.

In this case the coldest air is at the windows and along the outer walls, where it is continually falling; and though it may not feel uncomfortable for a few minutes, to remain in it will be very disagreeable, if not dangerous, if one has to remain for several hours at a time.

In this case about four pipes passed around the whole outside wall is usually sufficient to prevent the air from falling rapidly, and when it does come down, as it must in the natural course of the circulation to the registers, comes down more nearly alike in all parts of the room, the lower stratum (which is supposed to be the worst and certainly the coolest) being drawn off according to its gravity, and not having an outside stratum alternately hot and cold circulating around an inert centre.

Wall coils are sometimes made with manifold valve headers, or branch tees, and are admirable for the auxiliary school coils, as one pipe or any number of the pipes in a coil can be shut off separately from the others.

Another form of wall heater is what is known as a "trunion coil." Its efficiency is the same as the flat coil for the same number of pipes, and it is portable.

They are sometimes made with a return bend connecting each two pipes at their outer ends, and sometimes welded with a free end, with an inside circulating device.

Most of these coils can be made to appear very ornamental, as may be seen by the annexed illustrations.

No. 1 is the "flat coil;" No. 2 the "wall coil;" No. 3, a "wall-coil," with manifold valve headers, and No. 4 a trunion coil.

[To be Continued.]

MEXICAN HOUSES.

A correspondent of the London *Times*, writing from Mexico, says: "Springer, the capital of Colfax County, 716 miles from Kansas City, although surrounded by superior sandstone and some limestone rocks, at present consists of a few frame houses and some log shanties, interspersed with the true Mexican edifice, constructed of adobes, or bricks made of mud and water. The blocks, roughly cast in moulds, are usually about four times the size of an English brick, and are sun-dried. In this rainless climate these dried mud blocks are wonderfully durable; I have seen walls made of them 300 years ago still in good preservation. For the poorer class of Mexican dwelling, often about 16 feet by 12 feet, these adobes are placed usually singly, making a 10-inch to 12-inch wall, held together by a little mud mortar. At an elevation of 8 feet to 10 feet, fir poles or rough-sawn timber are laid from the front to the back walls, some of them projecting, without any regard to uniformity, two or three feet, and proving useful supports for suspending a pig, tools, drying clothes, or even the baby in its basket. The walls are carried about a foot above the roof timbers, on which are generally tacked rough boards, covered with a grouting of several inches of mud and gravel, from which rain is run off by a few wooden spouts or merely by holes left in the wall immediately over the rafters. Many of the older adobes are without a window, and the doorway, without the superfluity of a frame, is sometimes closed, as required, by a buffalo hide or other curtain. A fireplace is not always provided, cooking often being done in a small beehive-like oven, placed outside. The internal arrangements of such a dwelling—thousands of which are met with throughout New and Old Mexico—are of the simplest description. In many of the poorer houses in remote localities the beds, if such they can be called, are of hides (laid on the clean swept dirt floor), conveniently shaken and folded away when the occupants are astir. Many are still without either table or chair, for which a few rough stools are sometimes substituted."

A SCHOOL HOUSE AND FEVER NEST.

We give below a description of a school house in Hoboken, as made by one of our staff, together with a letter from one of the school trustees. That such a condition of things is tolerated in a civilized community is a disgrace and crime. Yet it seems our correspondent fairly states the situation, when he says that this is a mere "pimple on the surface of a very diseased body," and this part of Hoboken seems to be that sort of a "body." Yet there can be no good reason why the school should not be closed until lots can be secured, where the privies and urinals can be located and maintained without offense to the inmates of the class rooms, nor is there any reason why urinals cannot be flushed during school hours and contents of vaults removed every day.

It strikes us that here is a practical problem for the State Board of Health to tackle. At any rate with their support, it may be those who cannot thrive on stenches can succeed in reclaiming this vast cesspool, meanwhile the Priest and Beer Interest would seem to be good subjects for sanitary missionary effort.

That school house No. 3, in Hoboken, is in an eminently unsanitary condition, is an obvious fact. For, besides having a water closet that is nothing but a huge latrine between the wings of the building and immediately beneath the windows of several of the class rooms, it is also situated upon a marsh that receives the contents of two sewers. Adjoining the school house is a sluice gate that intercepts the sewer water and that of the marsh. At high tide this sluice is opened and allows the refuse in the sewer to be flushed into the marsh. At low tide all this sewage is supposed to flow out with the retiring waters.

But, in truth, a part of the in-washed sewage remains in the marsh. The sluice, then, is nothing but a flush gate that allows the sewer to be flushed alternately in and out of the marsh as the tide rises and lowers. At a distance of four blocks behind the school house another sewer empties into the marsh. It is termed the "Ravine Road" sewer. Some time ago it was broken at a point close to the marsh, and its contents were allowed to flow into it. In summer it is said that the odors in this vicinity are something appalling. The mere sight of the place bears witness to this statement. These facts constitute the evils of the marsh. The water closet, as stated, is but a huge vault, receiving all the refuse of the school, and is emptied every three days. It is divided into two sections, one for the boys, the other for the girls. In both there are two rows of seats, containing eight each, together with a private closet for the accommodation of the principal and teachers. In one corner of the vault is a trap and gate. The gate, which works on a lever, can be closely pressed against the mouth of the trap at will. In the boys' department there is a long iron trough urinal. No water runs into this, and its bottom leaks; the ground around it is consequently saturated with urine and emits a stench. The water closets, urinal and the marsh are not the only causes of complaint, though indirectly they contribute to the other evils. To keep the exterior stenches from penetrating within the building, the windows and doors are sedulously closed, and the inmates seem insensible to the vile atmosphere which accumulates in the class-rooms. The results are indicated by the fact, as we are informed, that many of the scholars are constantly ill and on an average three out of twenty teachers are on the sick list.

The following is the School Committees' last report:

"No change in the sanitary condition of this school has been made since last year's report. The three rooms reported as being badly located and illy ventilated are still used as class rooms, though every day spent in them during the warm weather must seriously affect the health of both the teachers and the scholars. The suggestion of the Board for the removal or remedying of this evil was partly carried out, by appropriating $1,800 for the purchase of the lots in the rear of the building. This sum not being sufficient, the purchase was not made. It is absolutely necessary that these lots be secured before tenement houses, with their numerous water closets, are erected thereon, thereby adding more poison to the already surcharged atmosphere, beside shutting out the light from rooms that are already too dark. The repairs, with the exception of kalsomining, will not be many, and those only trifling; some patching of plastering, a few windows and shutters, door-knobs, and the re-setting of a few patches of brick in the yard. Owing to the crowded condition of the three lowest classes, it was deemed expedient to divide them into sections, one to attend during the forenoon, and the other in the afternoon. Even with this arrangement, all of the children who have applied for admission cannot be accommodated, proving the necessity for the erection of a new school building as soon as possible. The building is heated by stoves, and is kept clean and in good order by a janitress."

To the Editor of THE SANITARY ENGINEER:

I was informed this morning by Mr. Kelly, principal of School No. 3, located on Adams street, Hoboken, N. J., that your reporter was over inspecting as to the situation at that school. There is much to be complained of in relation to sanitary matters in that section, and necessarily a good deal about a large school situated in a neighborhood like that where sanitary arrangements are so bad. I am one of the school trustees and have lived ten years in the same vicinity. I removed four years ago from there to a good situation in the up-town part of the city. I state freely that I was *stunk out.* I discharged my whole duty while there in trying to have a good system of sewerage adopted, and worked up to as far as practicable. I was appointed on a legislative commission to carry out a system of sewerage. Our commission—composed of clear-headed business men, including W. W. Shippen, President of the Hoboken Land and Improvement Company—set to work by first employing Levi D. Post, a Hudson County engineer, now of Atlanta, Ga., to make a survey and plan. Mr. Post did this in a very careful manner. In order that there might be no mistake, our commission called in Mr. Kirkwood, of Brooklyn, the most eminent in his profession we could think of. Mr. Kirkwood and Mr. Post went over the matter together. The former approved the latter's plan, with some alteration relating to further sinking the pumping station, so as to increase the grade of the sewers running into it.

The plan will be substantially understood by the referring to the inclosed map, which was made for another purpose, but upon which I have traced red lines to show the plan of sewerage. This plan covers that part of the meadows south of Eighth street. From Eighth street to the northerly end, at Weehawken, a similar plan was contemplated, but on account of that part being in its primitive wildness, and not yet used for building purposes, we concluded to defer that work for the then present.

We went so far as to have a contract given out for the main sewer in First street; also for the pumping basin and tail sewer. The property owners (some of them) raised a clamor, that we intended to rob them and destroy the foundations of their houses. They went to court and had our commission "knocked out" on a technicality. That ended that. I never had any pay for my work, neither had any of the other commissioners, except the secretary, who did some superintending, etc.

A few years afterward, some public spirited citizens stirred the matter up again, thinking that the general health was eminently endangered by this "slough of despond." Spiellmann & Brush—a firm of very clever engineers, located in Hoboken—were made interested and took a great deal of trouble surveying, calculating, etc. It was the old story. The people of the neighborhood got up meetings and raised an outcry, that there was a conspiracy to rob them, that their foundations would be all rotted, etc. And even the priest (I think it was Father Corrigan, still in Hoboken) raised a protest that the piles under the Catholic Church would be rotted, and the devil would be to pay generally. That settled it. Now we have the periodical howl about stinks, etc., around the school house.

The fact of the matter is, that the whole neighborhood stinks; there is practically no sewerage. The fluids from the privies all over the meadows permeate the filling, which is principally cinders from furnaces in New York City. Scratch into the ground anywhere for a few inches and you find a sickening, inky-looking fluid. Over this the same people who always defeat sewerage live, move and have their being! How they live, God only knows! I don't.

At last vacation we (the School Trustees) had the old school water closets torn out and had the best arrangement possible constructed. There was a foundation of plank laid on the flat down in the mud. The mason built up walls of the best brick and cement. It was a long trench under the seats like a bath-tub. It had a gate at one end which was worked by a lever; during the day the basin was filled with water. After school hours the gate was opened and all contained in the basin was put in the flood. It was in addition washed with a hose. Before the same order at present. All school privies small. Several years ago we asked the Council to purchase lots in the rear, so that the privies could be removed back from the school yard. They are now at the rear of the school yard. The Tax Commissioners appropriated $1,800 to buy the three lots. This was a fair price. The man who owned them, a wealthy citizen in the vicinity, saw his advantage, and refused to sell for less than $1,000 each. The Council would not submit to the extortion, and so the matter stands.

It is, of course, always a pity to see any people overwhelmed with stench and filth. It is their own fault. They say, "Let us alone and we will fill up." They have been let alone and they don't fill up. Here and there some one does fill up; this only increases the difficulty, as that filling acts as a dam against the outflow of stinking fluid.

We have a pair of engineers in Hoboken who are responsible for most of the mischief. All engineers of any standing or reputation favored the pumping system as the only solution of the difficulty. When Spiellmann & Brush, a rival firm, were working on their plans, the former firm was going round among the people making them believe that sewers without a fall or grade (no other can be had with the present legal grade) were good enough. They even offered to build them. I presume they didn't care much whether they worked or not, so long the job was theirs. They did not get the job. The whole thing has been abandoned, and remains at present in what the lawyers call *statu quo.* Attention is just now called to it by this school house howl. If it shows them and those in charge of the piles at Saint Mary's Church the necessity of a determined move of some kind, I say all right. We school trustees have done our whole duty in the matter. We are determined that none of the responsibility shall rest with us.

I have inclosed a publication which came out during one of the excitements about sewerage. It will explain the sanitary situation and the various plans. It is the only thing I could lay my hand upon which would post you up. This school house business now spoken of is a mere pimple on the surface of a very diseased body. Cauterizing the pimple won't serve. The remedy must be radical and far-reaching.

The above are all facts. For further information I would refer you to Spiellmann & Brush, engineers, at No. 13 Newark street, Hoboken. If you desire to investigate intelligently, they can post you up.

I don't desire my name to be running through the prints. I only wanted to set you on the right track as to investigation. Yours, etc.,

ONE OF THE TRUSTEES.

Hoboken, May 18, 1883.

The Washington *Star* prints a very interesting account of the library of the Surgeon-General's office of the United States Army, obtained from a conversation of one of their reporters with the librarian, Dr. J. S. Billings. This now famous collection of books had its origin in a small collection in the office of the Surgeon-General, which was probably commenced by Surgeon General Loball, about 1830. At the beginning of the late war this collection consisted of about 350 volumes, mostly medical text books and journals. In 1862 and 1863, while Dr. Hammond was Surgeon-General, about 360 volumes were added, being chiefly works relating to military medicine and surgery. A catalogue published in the fall of 1865 shows that the library then contained about 1,800 volumes. The catalogue of 1872 placed the number of volumes at 13,000, which chiefly related to military hygiene, medicine and surgery, to public hygiene and medical statistics. In 1874 there were 25,000 volumes and 15,000 single pamphlets catalogued, and since that date the growth has been uninterrupted and progressive, and at the present time the library contains 60,000 volumes and 66,000 pamphlets. Authorities now regard the library a better practical reference and working collection for medical purposes than the great library in the British Museum, or the Bibliotheque Nationale in Paris. Dr. Billings's assistants are Dr. Robert Fletcher and Dr. H. C. Yarrow.

E. G. LOVE, Ph.D., *Gas Examiner.*

THE RECUPERATIVE GAS LAMP.

Among the gas exhibits in the south nave of the Crystal Palace is a lamp which is worthy of notice as giving a good light with what is stated to be a very moderate consumption of gas, and which is self-ventilating. This is the recuperative gas lamp of Mr. Frank W. Clark, of 47 Millbank street, Westminster. Fig. 1 of our engravings is an external view of this lamp as fitted against the

FIG 1.

wall for interior illumination, Fig. 2 being an enlarged vertical section. The lamp body is fitted with a semi-globular glass *b*, and contains the concentric tubes *d*, *d*,' *e*, and *e*'. The connection between the outer tube and the lamp body is made with the reflector plate *g*. The structure of the upper chamber between the cover *c*, and the reflector is clearly shown. The gas supply pipe *t*, is fitted at one side of the lamp at *r* and is led into the chimney and descends in the centre to the burner *v*. The air for maintaining combustion enters in the first place through holes in the lamp body at *k*, and passes upward between the tube *d* and an outer screen to the cross tubes, whence it decends in the interior of the pipe *d* to the burner. The products of combustion rise between the tubes *d* and *d*',

FIG 2.

and in their exit part with some of their heat to the entering air, retaining sufficient warmth, however, to keep up a draught in the chimney, and carry off the water of combustion. Air can be admitted at *h*, between the reflector and the glass, to keep the latter cool if required. The ventilating tube is attached to the top of the lanterns when they are fitted up as brackets or side lights, as in Fig. 1; but when the lanterns are fixed in the roof of a building the ventilating tube is constructed in the same way as in the ordinary sun burners By this arrangement a system of ventilation is insured, as the vitiated atmosphere in the room passes through the lantern into the ventilating tube. The lanterns intended to be used for street lighting, railway stations, etc., do not require ventilating tubes. They can also be fitted to railway carriages which are supplied with gas either at a high or low pressure. Mr. Clark has constucted a number of lamps on this principle, and their working is stated to be perfectly satisfactory. It, of course, gives a shadowless light, which is a point of considerable advantage. Mr. Clark's aim has been mainly to produce a cheap and practicable lamp adapted for railway, street and indoor use, and in this he appears to have succeeded. Should the consumption of gas prove to be economical in regard to the light produced, there would seem to be a good future for the recuperative lamp.—*Iron.*

ELECTRIC LIGHT NOTES.

Reading, Pa., will be lighted by electricity by the first of June.

Electric lighting was introduced into Harrisburg Pa., on the night of May 14.

The Brush Electric Light Company are engaged in erecting towers for lighting Eau Claire, Wis.

Gas is be abolished from the Savoy Theatre in the entrance, corridors and offices, which will be lit with Swan lamps.

There will be a pavilion at the Electrical Exhibition in Vienna, designed to show the effect of the electric light on cloths and embroideries.

The Board room of the Stock Exchange is illuminated with the Edison electric light. Three chandeliers, of sixty-six lamps each, are suspended from the ceiling.

A committee has been appointed in England by the Board of Trade to determine the relative merits of oil, gas and electricity as light-house illuminants.

The Grand Trunk Railway shops at Montreal were lighted on the 12th ult. by arc lamps of the Craig system, devised by J. A. I. Craig, furniture manufacturer in that city.

The total number of electric lamps installed in England up to April 6, was 8,443, of which 4,463 belonged to the Edison Company of London, and 3,980 to the Manchester Company.

The owners of the Guion Line steamship "Oregon," now building at Glasgow, have contracted with the Edison Company for 500 H (6 c.p.) lamps. The vessel is to be fitted throughout with the electric light.

The library and dining room of the House of Commons is lighted by 265 Edison lamps. The Armington and Sims' engines, which furnish power, derive steam from the boilers of the ventilation works.

The Egerton Woolen Mills at Umritsar in the Punjaub are lit with Brush lamps. The power to run the dymamos is derived from the irrigation canals. The cost of each of the sixteen lights is sixteen shillings (about $4) per month.

The committee of the Brooklyn Aldermen, to whom the petitions were referred for permission to erect poles for electric lights in the streets, will report in favor of granting permission to the Fuller Electrical and the United States Illuminating Companies.

A committee appointed at a recent meeting of Councils of Philadelphia, and conststing of Messrs. Patton, Banes, Cuming, Smith and Hoffman, will proceed to Chicago this week for the purpose of inspecting a test of the American Sectional Underground Company's system.

The petition of the Hartford Elecric Light Company for leave to erect poles in the streets of Hartford, on which to carry their wires, was opposed for the reason that the erection of poles by the electric light, telephone and other companies was a nuisance and an unnecessary evil.

Philadelphia has just entered suit against the Bell Telephone Co., for $2,095.50, the amount of taxes said to be due on the wires stretched above the housetops in the city. The company claims that there is no tax imposed on those wires run over the house tops, but admits the legality of taxing those attached to the poles.

Sixty-four of the 70 electric lamps, which will illuminate the Brooklyn Bridge were lit Saturday evening. The current was derived from the central station of the United States Electric Lighting Company, which has the contract for lighting the bridge, but eventually a special plant will be established at the Brooklyn end of the Bridge.

The general Committee on Underground Communication have prepared and are issuing circulars requesting information or plans for underground electrical conduits, etc., to be submitted to the sub-committee on electrical and mechanical devices for their examination. Communications should be addressed to W. C. Behrens, 115 Broadway.

An electrical apparatus has been invented for the purpose of catching fish. It consists of three Edison electric lights, enclosed in a hermetically sealed glass case, which is surrounded by a glass globe, and capable of resisting the pressure of the water at a great depth. The light is turned on beneath the sea, and a net placed below the light will be drawn at the proper time.

Among the exhibitors at the Cincinnati Exposition, which takes place this fall, will be the United States Electric Light Company, the Brush Swan-Light Company, Excelsior Light Company, Edison Light Company, the Fuller Light Company, the Faure Storage and Light Company, storage batteries. The United States Light-house Board will display a range light and flash lights, with lamps, clockwork, etc.

We take these notes on the progress of the Light house Board, in the application of electric lights to light-houses, from an interview with President Henry Morton, reported in the *Sun*:

"Plans for testing the lighting of light-houses by electricity are nearly completed, and the test will be had at the entrance to the lower harbor, probably at one of the two Highland lights. In both France and England many light-houses have electric lights, but America has none. The test, he said, would demonstrate the success, or failure of electricity in light-houses in America. He believed that electricity (arc lights) would not be found to be serviceable for coast and harbor illumination, mainly because it wavers in intensity. The lights in American light-houses are so arranged as to throw regularly intermittent flashes to the navigator, and if the electric light should die down it would show a series of irregular flashes, and that might be very confusing.

"Prof. Morton has been carrying on a series of experiments with incandescent lights, with a view to reach the greatest possible light. He has succeeded in obtaining 400 candle power. This, Prof. Morton says, is really much brighter than one of the ordinary street arc lights. An incandescent light has thus been obtained powerful enough to conduct the experiment with.

"Two items of considerable expense remain. The great lenses used for the lamps now in the light-houses, it is found, serve to dissipate instead of to concentrate the rays of an electric light, so that lenses must be ground especially for the electric light. Two dynamo machines also must be at the foot of the light-house, one to be kept in reserve if the other should fail."

Meter-ites.

The trustees of the Gas Works, Philadelphia, have elected Alex. J. McCleary to fill the newly-made office of Controller of the Trust. They re-elected the Cashier, S. White; Superintendent Parks to serve for one year.

The Charleston, S. C., Gas Company announce a reduction in the price of gas from $2.75 to $2.50 per thousand feet in cases where gas is used for illuminating purposes, and from $2.25 to $2 per thousand where it is used for stoves and for engines.

May 10, a gas stove exploded in the baggage car of a regular passenger train on a Western road last week. There was no means of extinguishing the fire on the train, and it had to be allowed to burn itself out, thus delaying the train nearly four hours. The car, mail and express matter were all consumed.

The Commissioner of the Department of City Works of Brooklyn, has been directed by the Common Council to cause the gas furnished to the city to be examined as to its illuminating power, in not less than fifteen different parts of the city, and transmit to the Board at its next meeting the result of the testing.

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.*

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

(Continued from page 508.)

Circulation of Steam for Warming.—There are two methods of warming with steam, one with live steam direct from the boiler, and the other with exhaust steam. These two are frequently carried out in combination, and in fact generally so where exhaust steam is used at all for warming. The circulation or distribution of the steam through the warming pipes is effected in an almost unlimited variety of ways, each possessing advantages for special cases. The cause producing the circulation throughout the pipes of the warming apparatus is solely the difference of pressure which results from the more or less rapid condensation of the steam in contact with the radiating surfaces; a partial vacuum of greater or less amount is thereby formed within the radiating portions of the apparatus, and the column of steam or of water equivalent to this diminution of pressure constitutes the effective head producing the flow of steam from the boiler, while the return current of condensed water is determined by the downward inclination of the pipes for the return course.

When using live steam direct from the boiler, the system of what is called close circulation is carried out, either with separate supply and return mains, both of which extend to the furthest distance to which the heat has to be distributed; or else with a single main, which answers at once for both the supply and the return, either with or without a longitudinal partition inside it for separating the outward current of steam supply from the return current of condensed water. In what is called the system of open circulation, a supply main conveys the steam to the radiating surfaces, whence a return main conducts the condensed water, either into an open tank for feeding the boiler, or into a drain to run to waste, the boiler being then fed from some other source; in either case suitable traps have to be provided on the return main, for preserving the steam pressure within the supply main and radiators. These two systems, in any of their modifications, may also be combined, as is most generally done in any extensive warming apparatus.

In connection with closed circulation, the exceptional character of the single-main distribution calls for some further remarks. The employment of a single main for both supply and return is restricted to buildings where the horizontal distances through which the heat has to be distributed are very short, but where the vertical distances are relatively great. These conditions occur more particularly when the warming is extended to several stories, as in single dwellings or office buildings covering little ground.

There are three principal methods of single main distribution. In the first, the main is devoid of any internal partition, and is carried up from the boiler at once to the highest point, without taking off from it on the way any distributing branches, all of which are led off from it afterward in its descending course. Wherever in the ascending course, before the highest point is reached, it has to take an inclined instead of a vertical direction, it must rise at an inclination of not less than 1 in 30 to the horizontal, in order to let the condensed water run back in spite of the current of steam passing in the contrary direction. To insure the size being large enough, the diameter for a vertical main should be taken at least equal to that furnished by tables VII. to X. in the appendix; but for an inclined main (rising 1 in 30) the diameter should be doubled. This first method, however, is much embarrassed by the air which gets entrapped within blind branches that offer no thoroughfare; the radiators are, consequently, not certain of getting heated, and the apparatus is apt to be noisy for the reasons subsequently explained.

The second method applies to distributions extending through considerable distances horizontally. Here it is more satisfactory to start with a primary circulation through separate inclined supply and return mains, in place of a single main, however large or however steep; and to relegate the single-pipe system to a secondary rank, employing it for vertical branches led off from the primary supply main. The course of the primary supply main is a descent with proper slope to the remotest horizontal distance; and, immediately underneath each single pipe branch rising vertically from it, a receptacle is provided in the primary main, large enough to catch all the condensed water returned from the branch; these receptacles are themselves drained back to the boiler by the return main. From the vertical single-pipe branches, short single offshoots are led off laterally to the radiators in the rooms of the different stories. The air difficulty is avoided with much success, by carrying each vertical branch first to the highest point required, free from all lateral offshoots; and supplying the several radiators from its descending or return course, by connections so arranged as to preclude lodgment of air.

In the third method of single-main distribution, which is possibly as satisfactory as either of the two preceding, a single upright pipe is employed, having a hoop-iron partition tightly inserted for separating the ascending from the descending current. Such a pipe need be no larger than prescribed by tables VII. to X. in the appendix.

The system of closed circulation requires the boiler to be placed so low as will allow all the return pipes to drain freely back to it above its water-level. This condition has been modified mechanically by the automatic "Albany trap," a device frequently employed for lifting from a lower level part or all of the condensed water, and delivering it into the boiler; it is in fact a displacement pump. The same result has been attained by draining into a closed tank, placed low enough to accommodate all the return pipes, and made strong enough to stand the full boiler pressure with safety; and then employing a steam-pump, either reciprocating or centrifugal, to raise the water from this tank to the proper level for enabling it to flow back into the boiler, the whole of the circulation being closed from communication with the atmosphere.

Steam mains and branches are apt to be noisy whenever any dipping bend or pocket in the pipes, or any recess in the fittings, allows water to accumulate, and to become cooled below the temperature of the steam supply. In such cases a rapid condensation occurs there, and the steam rushing in carries the water along with it; or sometimes two opposing currents of steam, rushing into the vacuum, meet each other, and characteristic noises of rattling and hammering are produced.

Where separate supply and return pipes are used, whether the system of circulation be open or closed, they should everywhere slope downward in the direction of the current of steam or of water. A fall of ½ inch in 10 feet (1 in 240) has been found ample to provide against all sag of the pipes or other mechanical defects in the work, and to insure silent working. When the levels at which the radiators have to be placed do not admit of this slope being continued in the so-called horizontal supply main, vertical breaks are made in the line by the insertion of pipes of larger diameter, which are trapped by check-valves or syphons into the return main. In any extended distribution by separate supply and return mains, the supply main should be connected to the return at the remote ends by the method of open circulation; and between any parallel or not very distant supply and return pipes, occasional drips should be provided, at intervals of say 600 to 1,200 times the pipe diameter, syphoned off to prevent any short circuit. Branches upon the horizontal mains, whether supply or return, should be connected upon the top of the main, not at the sides or bottom. Freedom for expansion should be allowed by horse-shoe or S bends, or when practicable by elbows judiciously arranged. Expansion joints are an established fitting for warming apparatus; but their use is not to be approved except in emergency. Repairs are facilitated by substituting at frequent intervals along the mains, in place of some of the screw couplings, cast-iron flange joints, the flanges being screwed upon the tube ends. Main pipes should in all cases be either carried on rollers or suspended, to allow freedom for expansion without straining the joints. The author does not attempt to describe completely all the minutiæ of detail in the construction of the mains for warming by steam; but simply notices some of the appliances commonly employed in America, which have been devised and worked out practically, and are regularly manufactured for general use.

Clothing of Steam Mains.—To prevent loss of heat, steam mains are protected by clothing, as described by Rumford in the last century. Felt is found to perish when applied direct to a surface as hot as 200° Fahrenheit; and Rumford's air-space, formed by inclosing the main within a rather larger casing of thin cast-iron, or, of sheet-iron either plain or tinned or zinced, is sufficient for enabling the felt to be employed as the clothing outside the casing. A covering of wire-netting has also been devised. Coats of porous terra cotta or of porous plaster answer, by their low conductivity, to save the felting, put outside them. Outside the felt again is applied some suitable sheathing protecting covering that will stand the exposure. When thus clad, the loss incurred in carrying a steam main to any distance—either out of doors, or inside rooms, in passages, in cellars, or in culverts or flues either underground or above—is found to be less than 1 unit of heat for each 100 square feet of external surface of the main itself. The ratio which this loss bears to the total quantity of heat transmitted is exemplified for particular cases in table XII. in the appendix.

* A paper read before the Institution of Civil Engineers, November 28, 1882.

TABLE VII.

Internal Diameters of Steam Supply Mains, with total resistance equal to 2 inches of water column.

Steam, Pressure 10 lbs. per sq. in. above atm. Temperature 239° Fahr.

Formula, $d = 0{\cdot}5374 \sqrt[5]{\frac{Q^2 l}{h}}$ where d = internal diameter in inches;

Q = 9·2 cubic feet of steam per minute per 100 sq. ft. of radiating surface;

l = length of mains in feet; h = 159.3 feet head of steam to produce flow.

Radiating Surface.	Internal diameter in in. for lengths of Mains from 1 ft. to 600 ft.

[1]*E*.—The elbows are assumed to occur at intervals of not less than 120 times the nominal inside diameter *D* in the corrected length of main *G*, and never to exceed twenty in number.

[2]*L*.—The outside surface of the water return mains, which are of the same length as the steam supply mains, is assumed to be only one-half that of the steam mains; and the cost per square foot of either surface is taken at double the cost per square foot of the radiating surface.

Correspondence.

PROF. BAUMEISTER'S PAPER ON SEPARATE SEWERAGE.

To the Editor of THE SANITARY ENGINEER:

Criticism, *ex cathedra*, is always interesting and generally instructive. Prof. Baumeister's paper (of which a translation appeared in the May 3d number of THE SANITARY ENGINEER) indicates a careful review and consideration of the whole question. With many of his arguments I am in full accord. There are some points, however, in which he seems to be mistaken, and these are points upon which his general conclusions are largely dependent.

I think he puts the difference between the area of the flow of combined and separate sewers at too low a figure. With a separation of all storm water, it is usually considered that in this country the difference is as one to fifty instead of one to thirty. He says that the beginning of decomposition may be of little importance when a good ventilation of the sewers is provided. He thinks that with the egg-shaped section of sewer we may get the same advantage of small invert radius that we have with small pipes. He thinks that "the whole comparison" is reduced to the amount of flushing water required in the two different systems. He fully agrees with what I have long believed as to the disadvantage of admitting street dirt into the sewer, and to overcome this disadvantage an enormous amount of flushing water would be required. He says that a disadvantage revealed itself in the Memphis work through the introduction of obstructing objects which would not have obstructed larger sewers. He seems to find fault with the digging up of the streets that has been required to remove obstructions in Memphis. He says that, "according to our ideas," dirt should not be allowed to accumulate in a gulley so that it would not be efficiently covered with water.

The most important point to which I would call attention is Prof. Baumeister's statement that with equal openings the ventilation of large sewers is more efficient than that of small sewers. This statement he emphasizes and sets forth so distinctly that it may almost be called the turning point of his argument.

Basing his opinion largely on the statements to which I have referred, he concludes, that the decision between the separate and combined systems is not to be decided on the ground of "sanitary advantage," but rather on financial considerations.

It seems to me that Prof. Baumeister is wrong in several small points, and very wrong in his most important one. The decomposition of organic matter in sewers cannot be regarded, however well they may be ventilated, as a matter of little importance. The use of egg-shaped sewers with a small invert, while it may secure the removal of ordinary house wastes without difficulty, provides, as Mr. Gardiner clearly showed, an almost ideal hotbed for microscopic growth. Theoretically speaking, the comparison may, perhaps, be reduced to quantity of flushing water; but in order to secure the same result in large combined sewers that we have in the small pipes of the separate system, the difference in the amount of flushing water is simply enormous beyond all *practical* consideration. Much has been said about the obstruction of sewers in Memphis by bones, chips, etc. It is a sufficient answer to this if we say that during the three years of use of the whole system, beginning with a length of eighteen miles and now double that length, there have been in house drains and sewers together only 75 stoppages; not more than half of these have been in the sewers, being equal to one stoppage per year for each three miles of the system. It is also to be considered that these stoppages occurred mainly at the outset and in undue proportion, in the work of a single engineer, who was evidently careless in making the joints between the pipes. The inconvenience to traffic and the cost of the work has been practically nothing, far less to either than would have been any system of inspection at man-holes and lamp-holes. The absence of man-holes was adopted originally from motives of economy. Careful observation and consideration have shown me that with sewers constructed as are those at Memphis, and efficiently flushed as they are, it is far better not to have man-holes and lamp-holes than it is to have them. I should not allow their construction if they cost nothing. They are much more likely to lead to the introduction of obstructing rubbish from the surface of the street than they are to aid in the removal of obstructions. In this conclusion I am sure that I am sustained by the official engineers of Memphis, who have had so much experience in the management of that work. The hand-hole pieces referred to by Prof. Baumeister are not inserted only where pipes are broken into to remove obstructions. They are placed at regular intervals along the line during construction and are carefully indicated on the plans; so that when obstructions are to be removed, they may readily be found, and the breaking of the pipe may be avoided.

My observation in European cities, where catch basins are used, has satisfied me that, whatever may be "our ideas" on the subject, those catch basins are often a disagreeable and marked nuisance, not so much so there as here, but sufficiently so to be considered objectionable.

On the question of ventilation, I must differ entirely in theory and in practice from Prof. Baumeister. In my judgment, he is entirely wrong with reference to the relative ventilation of large and small sewers. The retardation of the movement of air by friction in sewers is practically limited to the retardation by friction in the ventilating channels, and will be of no practical account in any case. If the ventilation is through house drains and soil pipes, it is here and not in the larger sewer that the controlling retardation will occur. A given amount of ventilating opening will move the air with which it connects, not perceptibly in proportion to the size of the chamber containing that air, but in proportion to the movement through the opening itself. Furthermore, one of the strongest ventilating agencies in sewers is the movement of the water flowing through them, producing an effect by friction on the superincumbent air. In the small pipe this movement will be communicated to the whole of the contained atmosphere, while in a large sewer there will be comparatively little effect, except on those layers which are within a few inches of the surface of the moving water. Where flushing appliances are used, the influence of the sudden discharge on the contained atmosphere of a small sewer insures complete renewal. With large sewers its effect would be but slightly greater than that of the ordinary stream. The Professor's subsequent reasoning on this subject, being founded in error, seems to me erroneous throughout, and I am confident that anyone who will thoroughly examine the sewers of Memphis and compare their condition with that of the best sewers constructed, even by Lindley, in Europe, will confess that there is practically a radical difference as to odor between the two.

If my comments are well founded, I think that I have shown a sufficient reason for disregarding Prof. Baumeister's conclusion, that the decision as to whether to use the separate or the combined system should rest on considerations of finance rather than of sanitary condition.

In closing, I must refer to the statement that, inasmuch as water seal traps separate the air of our houses from the air of the sewer, the bacterial growth may be disregarded. He says: "Only a relative, not an *absolute*, difference exists between both systems, and, so far as the safety of the population is concerned, this difference does not amount to more than that which exists between a wild animal confined in a cage, or not existing at all in a country." For my part, I adhere strongly to the opinion that this kind of wild animal had better not exist "at all in a country," and that if it does so exist, we shall need something more efficient than water seal traps to confine it to its insecure cage. This is a case where absolute prevention is the best and only proper protection.

GEORGE E. WARING, JR.

AN EXPLANATION.

MADISON, WIS., *May* 18, 1883.

To the Editor of THE SANITARY ENGINEER:

In the Construction Notes of your issue of the 10th inst., a copy of which I have just seen for the first time, you have a few lines referring to the Madison, Wis., Water Works, which are liable to create a very erroneous impression. The newspaper article from which you quoted was written because of impatience at the delay in completing the work, due to the following circumstances:

1st. The city, in attempting to obtain a supply of water from artesian wells, unfortunately awarded that portion of the contracts to an incompetent man, although he came well recommended, and when he failed to do what he contracted to do, he had no alternative but to "pack up his tools and leave the ranch." 2d. The contractors for machinery and foundations tried to do some "scamp" work on the latter, which I refused to pass, and their bondsmen had to take it out and replace it—the contractors having made an assignment during the past winter. This contract should have been completed late last fall, but the wells being unfinished, and the city not having a supply of water sufficient to test the machinery, did not insist upon a speedy completion of the work, but made temporary arrangements for supplying the city with water until the machinery could be completed. Other than the above, there is nothing that could come under any possible meaning of the term "sloppy work," and it naturally caused some "friction."

Since Dec. 1 the city has been supplied fully and regularly with water for domestic purposes; besides, the works, as now running, were the means of extinguishing what might have been a very serious fire at the large plow manufacturing works here.

The reasons why "no considerable portion of the citizens are yet supplied with water," are that until lately there was but one plumbing establishment here, and that there have been but eight weeks since the time we were ready to supply water during which the ground was not frozen so hard as to prevent making service connections. In that time about one hundred connections have been made, and applications are coming in faster than the connections can be made.

Very courteously yours,

C. B. DAVIS, *Engineer*.

[THE SANITARY ENGINEER simply made an abstract from the *Wisconsin State Journal's* account of the condition of things, making no comment thereon. It prints, with pleasure, Mr. Davis' explanation.—ED.]

CEMENT FOR GLASS PIPES, ETC.

BOSTON, *May* 10, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you please inform me what you consider the best kind of waterproof cement for connecting glass or pottery ware set in iron frames, like the glass pieces used in such water closets as the "Hartford Glass Closet?" In this closet a waterproof elastic cement is used. I see, however, by the London *Sanitary Record* of February 15, 1883, p. 362, that a silicated mastic is referred to as inalterable as glass for use in cementing glass coffins, and rendering them hermetically sealed.

Do you know of such a cement or mastic? If not, what kind should you think would come the nearest to the ideal referred to in the *Sanitary Record* for this kind of work?

Very respectfully yours, SUBSCRIBER.

[A practical glass-blower recommends the following for attaching glass to metal: A quantity of litharge is placed in a cup, into which is poured glycerine and stirred until about the consistency of condensed milk; this cement is waterproof, and will stand high temperatures. For cementing glass to glass, as glass labels on bottles, a mixture of three parts of resin to one of beeswax is used; this will not stand heat, however. We are not acquainted with the silicated mastic referred to by the *Sanitary Record*. In the construction of glass-lined iron pipe, plaster of Paris is used between the glass and iron, except for about an inch at each end of a section, where hydraulic cement is used. "Spon's Encyclopedia of the Industrial Arts, Manufactures and Commercial Products" gives many recipes for joining metal and glass, some of which you may find suited to your wants. The elastic cement used in the glass water closet referred to, can probably be obtained of the manufacturers of the closet.]

PAINTS FOR RADIATORS.

ST. JOSEPH, MO., *April* 30, 1883.

To the Editor of THE SANITARY ENGINEER:

You will confer a favor on me, and perhaps many others, by giving, through the columns of your paper, the best paints for painting steam radiators so as not to impair their efficiency. I should like a reddish brown color.

Yours respectfully, I. T. HOPPER.

[To prepare radiators for bronzing, wipe the oil off, and apply a coat of paint made of yellow ochre and boiled oil, with enough white lead in it to increase the "body" of the paint. When the painting is completed turn on the steam immediately and bake the whole until you can just break

Digitized by Google

the skin of the paint with your thumb nail. Then allow the paint to become hard by air drying, when you may size and bronze to suit your taste. If after the bronze is properly set you put a coat of varnish over the whole, the good appearance will last longer.

If you wish to paint the radiators only use ochre and oil, and any pigments you like to get the desired shade, and bake with steam heat as above; then varnish.

Repeated heavy coats of paint impair efficiency, but not to the extent commonly supposed.]

LEAD BURNING.

St. Albans, Vt., *May* 10, 1883.

To the Editor of The Sanitary Engineer:

Seeing in your issue of April 26 a remark from M. R., I would like to ask him, through the columns of your valuable paper, to please explain how he can burn his lead boxes as handily with a hatchet-bolt as with a machine. I have been at the business twenty years, and have never yet seen lead burning with a hatchet-bolt.

Respectfully yours, Jack.

[We refer this to M. R., for the information desired.]

STUPID WORK.

Baltimore, Md., *April* 21, 1883.

To the Editor of The Sanitary Engineer:

Inclosed I send you two pen sketches of some jobs of plumbing work done by some of our so-called plumbers in Baltimore.

The sketch marked Fig. 1 was done by a man who is part tinner, part stove man and part bricklayer, and I suppose part plumber—in other words, Jack of all trades and master of none. The stench arising from it was so bad that the owner was compelled to have an examination made by another person. When the examination was made and the glaring defects pointed out, the botch of all trades contended it was all right and threatened to enter suit for damages to his business against the man who made the examination. For the sake of truth, and justice to the trade, I am heartily sorry he has not carried out his threat. The public ventilation such work would have received in a lawsuit would have opened the eyes of our people to the urgent necessity of official inspection of plumbing. No 1 is bad, but sketch No. 2 is worse, but was done by another person, and in the heart of our city.

If the owner's statement about No. 2 is correct, and knowing him, I believe it to be so (for the man who did the work I know to be fully competent to recommend such work), originally there were traps under the water closet, but he recommended the owner to take them out and use a straight pipe to one water closet, and an eighth bend connection in the other, using hoppers in both cases instead of the water closet.

The end of the soil pipe was open, I suppose for the purpose of cleaning out, as there was no water attached to one of the hoppers, and the open end was lower than the hopper, and when I saw it the filth was running over the top and down the groove in which the pipe was put. The only fastening the pipe had was a piece of washboard, on which one of the bell ends of the pipe rested. The joints were made with sulphur. It was impossible for the pipe not to stop up, even if it had a proper supply of water, because about one half of the lower end rested on a brick at the bottom of the groove, immediately in which the cesspool is located.

No proper language I could use would be strong enough to condemn such work, and the jail or penitentiary is the only fit abode for the men who do it. Plumber.

[Baltimore needs a good plumbing law, well enforced, so that men found guilty of doing such wretched work can be punished.]

Fig. 1.

The pipe below the branch to which the trap is connected is 4-inch cast iron, and from the branch up, to and above the roof, is 4-inch tin pipe, with slop joints, and to make bad worse, there is a 4-inch opening in said pipe under the seat for to ventilate that space.

Fig. 2.

No attempt at ventilation in this case (except through the hoppers into the house or building), as offices on first floor and small manufactories on upper floors.

BOILER TOO SMALL.

Springfield, Mass., *April* 28, 1883.

To the Editor of The Sanitary Engineer:

I notice that you kindly answer questions on subjects treated of in your paper, hence the liberty I take.

In my private house, I have a boiler in connection with a low pressure steam apparatus, which has given me much trouble all through the winter, and the opinion of local experts leave me worse off than I was before I spoke to them on the subject, as they do not agree, three of them having three different theories.

The boiler makes steam rapidly enough, being a pipe boiler, when there is a good fire; but should the fire run down a little, and a fresh one be put in, it will take 10 or 15 minutes again before any steam will appear—not until the fire burns brightly. But this could be gotten along with, as the house is always warm enough, only for the fact that every time the steam goes down, the boiler fills up with water; which water has to be run off again if we want to prevent an inordinate amount of noise during the time things are getting into shape.

Where does this water come from?

I tested the automatic water feeder, and am pretty positive it does not leak, and to confirm my opinion in this respect I can say the boiler never fills when I am not using it.

One steam fitter said, "pipe boilers always act that way," and seemed to look on it as a foregone conclusion. Another said the boiler "made steam too fast," and carried the water into the pipes, while the third adhered to the idea of leaking under a certain condition, say when it is hot.

An early reply will be read with much satisfaction.

Very respectfully yours, W. H. C. C.

[The steam fitter who says the boiler makes steam too fast, evidently thinks that the steam when filling the pipes and radiators again, carries water up mechanically, which sometimes happen with poorly constructed apparatus, and the one who says all pipe boilers act that way, is influenced by the fact that pipe boilers are more likely to act so than shell boilers.

All pipe boilers do not act as you describe above, nor are all shell boilers free from the same trouble.

The number of pounds of steam which is necessary to fill all the coils, etc., and all the condensed water, which is in transit, represent the same number of pounds of water which have been drawn from the boiler during the time steam has been increasing in pressure. Or another way to make it plainer: one cubic foot of water will fill about 103 feet of what is known as one-inch pipe, or 95 feet of 1¼-inch pipe, and the same converted to steam at ten pounds pressure, though capable of occupying 1,000 cubic feet of space within the heaters, if no condensation went on, in reality occupies less than one-twentieth of that space in consideration of the water, which is forming dew-like on the internal surfaces of the radiators, and which is slowly running in the bottom of the pipes on its way back to the boiler, but of which may be said, though it goes out *on time* (in steam), it comes back *late* (in water).

Thus, if we imagine a pipe boiler made of 165 vertical one-inch tubes with the water-line within the tubes, before steam is gotten up, we will have to imagine the water one foot below the true or intended water-line after steam is up, for average conditions, should no water be admitted to the boiler.

But in ordinary apparatus with a feeder in good order, the feeder begins to let in water with a change of level of one-half inch, maintaining the boiler level while steam is up; but when the steam runs down, this water which has been the vehicle of the heat, begins to manifest itself again within the boiler, filling the boiler one foot higher than the intender or true water-line.

In a pipe boiler, with a drum on it, in a nearly horizontal position, with the water-line within the drum, this is different. For should the drum be only one foot in diameter by 6 feet long, with the true water-line in the middle of the drum, the fluctuations of the water for the same conditions could be only two-inches below or above the centre, requiring in one case a total range of two feet, and in the other only four inches if there is no water-feeder, and only half that difference with one.

Narrow upright shell boilers give the same trouble, though perhaps not in as great a degree, while in broad ones it is not perceptible.]

NOTES FROM CINCINNATI.

(From our Special Correspondent.)

The fire escape ordinance of Cincinnati is a failure. Following upon the excitement resulting from the Milwaukee calamity came a strong effort to force property owners to provide efficient means of escape from factories, boarding houses and hotels especially. The duty was imposed upon the Smoke Inspector. His threats to prosecute those who failed to provide escapes proved effective with but a small proportion of owners, each of whom determined for himself what he deemed sufficient. Some provided rope ladders to fling out or windows, some metal ladders running up the sides of buildings, and others mere excuses for compliance with the law. Most of them were so impracticable as to be mere death traps. The Inspector took a rope ladder man into court, and the court ruled the rope ladder to be a compliance with the ordinance, which loosely requires "a ladder or other sufficient means of escape." The hotels afraid of their reputations for safety, are nearly the only class of buildings which the inspector can control. These have been furnished with iron ladders and proper platforms to enable the occupants to find a footing upon them. A great local holocaust seems necessary to arouse public sentiment to the point of compelling the erection of

Digitized by Google

escapes. Public sentiment, it has been very clearly determined, is the only law in Cincinnati.

The consumption of smoke in this beclouded city may be said to have ended in smoke. Under the stimulus of a new ordinance and a man to enforce it, the nuisance has been somewhat abated; but devices have had their day and the general public is settling down to the conviction that the careful stoker is the only smoke consumer.

The frequency of boiler explosions in the Ohio Valley, and in fact their frequency everywhere, attended as they usually are with the destruction of both life and property, is a matter which seems to demand a more thorough scientific inquiry than it has yet received. The injection of water into boilers, which, through the carelessness of engineers, or a failure of the supply pump to work, have been permitted to become full of super-heated steam from a little water, doubtless accounts for some of the explosions, but by no means for all. Some time ago, in a case pending in our courts for damages resulting from the explosion of a boiler, a gentleman in the witness stand related the following interesting experiment: He constructed a small boiler some three feet in length by a foot in diameter and attached to it a guage. Through a packing box on the top he passed a rod to the end of which within the boiler he attached a perforated pan as large as could be conveniently raised and lowered within the boiler. Allowing it to rest below the water line, he made twenty pounds of steam. Then standing above the boiler he raised the pan quickly above the water line into the steam space. By reason of the numerous small streams flowing from the perforated pan a large surface of water became exposed in the steam space. He looked at his guage, and, behold, the dial hand showed a pressure of forty pounds. The pressure had doubled instantly. He dropped the pan below the water line precipitately, feeling thankful that he had not tried his experiment with his little boiler at a fifty pounds pressure, as in that event he would not probably have been present in court to testify to the result of his experiment. The theory of course is that the water brought suddenly up into the steam space was instantly vaporized by the latent heat. Against this theory, or despite this fact, if it be a fact, some engineers persist in feeding their boilers into the steam space directly, and claim that it is in no way dangerous. Indeed, there is no settled opinion upon the subject among practical operatives, and science ought to investigate. The priming or frothing of boilers, since it involves a danger against which the most watchful engineer cannot always guard, is also a matter for thorough investigation. The use of crude petroleum oil in boilers, with a view to prevent scales, is doubtless one prolific source of foaming. That any oleaginous scum or surface on water will produce such a result the cook's kettle daily demonstrates. The last boiler explosion here, occurring in the Globe Rolling Mills, general opinion refers to the use of oil. Generally, however, the causes of boiler explosions are veiled in mystery. A prominent engineer of this city, whose official position requires that his attention should be given to this question, says that he has noticed that the explosions of boilers are far more frequent among those using the waters of the Ohio and its tributaries than among those using the waters of the Northern Mississippi; and that those explosions nearly always occur during high water when it holds the greatest quantity of earth in solution. Insomuch as vegetable and mineral substances rise to the surface of water when ebullition begins, the explosions may be referable to the foaming likely to result. Your correspondent, however, makes no pretension of ability to solve the mystery. What part the carbonate of lime forming as a scale within the boilers may perform as an agent of destruction is a mere matter of speculation, and that as a poor conductor of heat it necessitates an increased expenditure for fuel in some proportion to its thickness every engineer knows. He knows also that the boiler plates are in consequence kept at a much higher temperature than they could attain to if directly in contact with the water, and that when it gathers in sufficient quantity over the furnace, the plates often attain a temperature so great as to bag down. The gathering of scale is the engineer's chief dread, and numerous devices to prevent it are resorted to. Until the theories of boiler explosions are solved it must continue to be a matter of interest to manufacturers and engineers, thousands of whom are daily asking for information.

A small-pox sufferer wandered around the Municipal Building in Brooklyn, last week, looking for the Health Department to take charge of him, and found a great scarcity of clerks who were willing to direct him. He was finally sent to the small-pox hospital at Flatbush.

Dr. J. H. Raymond, Health Commissioner of Brooklyn, asks the Board of Estimate to grant a hearing on the establishment of a hospital for contagious diseases.

Dr. J. S. Billings has been selected by the Secretary of War to represent the Medical Department of the Army, at the annual meeting of the American Medical Association, to be held in Cleveland next month.

At a recent meeting of the Newport Sanitary Association, Mr. A. B. Almon, of Salem, Mass., was elected treasurer in place of Mr. T. G. Ford. Professor Raphael Pumpelly presented an important report as to that portion of Easton's Pond from which the city's water supply is obtained. Persons before renting cottages take the trouble now to ask for a certificate from the Sanitary Association before taking a lease and by such wise action compel the sanitary arrangements to be in the best possible condition.

Walter J. Morris, C.E., died in St. Luke's Hospital on the evening of the 16th instant. He projected the Broadway underground railway, and was the engineer of the South Ferry and direct transit enterprise in Brooklyn.

On May 11, at a meeting of the Society of Medical Jurisprudence, a paper on "Prison Sanitation," read by Charles R. Kitchell, was discussed by Prof. Rice, of Columbia College, Dr. Spitzka, Dr. C. S. Woods and others.

The Hygienic Exhibition in Berlin was formally opened, on May 12, by the Crown Prince, Frederick William. A large number of State and city officials and many deputations were present at the ceremony.

Mr. Otto, the inventor of the gas engine of that name, has again instituted proceedings against unscrupulous parties for infringing his patents. Mr. Otto's right to claim a royalty from defendants in such cases has always been upheld.

The Wisconsin Legislature at its last session enacted a law which makes obligatory—first, the organization of a board of health in every town, village and city in the State within thirty days after each annual election; second, the appointment of a health officer by every board of health within ten days after its organization; third, the report of contagious diseases by all physicians.

An explosion of gas in a street sewer in Peterborough, Eng., recently, was attributed to dynamite and the Irish conspirators.

The Parkes Museum of Hygiene will be opened in its new quarters May 26. The use of the museum will be given to teachers of sanitary science, for instructing their pupils in the management of sanitary appliances.

To represent Western architectural and building interests, *The Inland Architect and Builder* has been established in Chicago. The journal is well printed—and this, by the way, is a noticeable feature of the latest class publications which we have seen—and gives considerable information about architects and architecture in the chief Western cities. It is issued by the Inland Publishing Company.

PLUMBING LAW VIOLATION.

Only three violations of plumbing regulations were reported to the health department of this city during last week, viz., two by Inspector Hooper and one by Inspector Hicinbothem. All were of a trivial nature. One violation of a light and ventilation plan was reported by Inspector Berry. No cases were referred to the attorney.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

NEW COIL.

Our illustration this week shows a flat coil of eight one-inch steam pipes, four feet long and set one over the other,

each pipe having a pitch in the direction of the steam of $\frac{3}{16}$ of an inch and occupying a perpendicular height of only 15 inches over its greatest measurements.

The bends are what is known by the steam trade as "box bends," and are so constructed as to hold the coil together without being strapped in the ordinary way, which show the straps; a butt plate tapped on the inside of the large bends being all that is required.

Each two pipes pitch in the same direction and the coil may be said to be in two sections, giving only a length of about 16 feet from inlet to outlet.

It was designed by one of our correspondents, to be used under parlor windows for hot water, though it will work equally well for steam.

Construction Notes.

CONEY ISLAND.—The contract for constructing about two miles of sewers has been given to the Improved Sewerage and Sewage Utilization Company, of New York.

MICHIGAN CITY —Bids for Northern prison sewer were opened May 12. The lowest was W. H. Meyers & Son's, Fort Wayne, $8.47 per foot. The award of contract has been deferred.

ANN ARBOR, MICH.—The Common Council have appointed a committee who will consider the question of water works.

NORTHAMPTON, MASS.—Engineer E. C. Davis has been making plans for the proposed reservoir in Roberts' Meadow Brook. Two reservoirs are talked of—one near the Roberts' Meadows to contain 15,000,000 gallons, the other at Bridgman's Farms to contain 99,000,000 gallons. The present reservoir has a capacity of only 4,000,000 gallons.—*Engineering News.*

RAILROAD BRIDGE.—The contract for a bridge over the Whitewater River, for the Cincinnati, Indianapolis, St. Louis & Chicago Railroad, has been awarded to the Keystone Bridge Company, at $21,000.

BELOIT, WIS.—A private company, Mr. John Hackett, President, has the construction of water works in hand, to be finished before next winter, at a cost of $100,000.

WEST SHORE RAILROAD CONTRACTS.—Plans for construction and repair shops at Frankfort, N. Y., to cost from $500,000 to $600,000, have been prepared. Contractors must submit bids to the New York office by June 1. The contract for the round-house has been awarded to W. Dickinson and C. L. Merrick, of Syracuse, at $52,000; for gas works for the railroads' use, to Moore & Carr, also of Syracuse, for about $25,000.

PHILADELPHIA.—The following contracts were awarded by the Highway Committee of Councils for constructing a main sewer from Fairmount to Girard Avenue Bridge: this contract was divided into three parts, first part being awarded to Cornelius Kennedy at $50 per cubic foot, second to P. S. McTague at $18 per cu. ft., third to Cornelius Kennedy at $16.18 per cu. ft.

CHICAGO.—Proposals for constructing several miles of brick sewers will be opened May 26.

The strike of the bricklayers, which goes on unchecked, has stopped, temporarily or permanently, for the season, three-fourths of building.

Digitized by Google

PHILADELPHIA.—It will be remembered that the Board of Experts, in a recent report, recommended that surveys and analyses of waters be made for determining possible sources of the future water supply of the city. These operations will be prosecuted at once. The surveys will be under the charge of Mr. Rudolph Herring, C.E., of this city, and the analyses of the water will be made by Prof. Albert R. Leeds, of Hoboken. The surveys include the territory upper Delaware, the Lehigh, Perkiomen and Schuylkill. Surveying parties will be sent out at once, and preparations are now making for rainfall observations, and gauging of possible sources of supply.

An ordinance has been reported favorable by the Highway Committee of Councils, for macadamizing South Broad street to Passayunk and Moyamensing avenues.

The Select Council, on May 17, passed the ordinance authorizing the Market Street P. R. W. Co. to lay a cable. This privilege is granted, providing the company reduces the fare to five cents.

LONG ISLAND.—The Long Island Water Supply Company has started to build its works to supply New Lots with water. The reservoir will be stationed on the hill upon which the Ridgewood reservoir is located, in that portion formerly known as the East New York Grove. Men are now clearing off the woods. The water pipe is being laid, and it is expected that the works will be in operation by the fall.

COLUMBIA.—The contract for the construction of the new centre building of the State Lunatic Asylum was given, May 3, by the regents, to Mr. R. W. Johnson, of Columbia, for $48,500.

KINGSTON, N. Y.—The Kingston Water Company, of Kingston, Luzerne County, was chartered at the State Department May 16. It has a capital of $30,000.

BIRDSBORO, PA.—The people of Birdsboro, Pa., are building water works at a cost of $40,000. The reservoir will hold 1,000,000 gallons.

ALBANY.—The Anglo-American Petroleum Company, formed for drilling oil wells, etc., in Genesee and Allegany Counties, was incorporated on May 15, with a capital of $750,000.

ALBANY.—Incorporated on the 14th were the New York Metal Exchange, formed to foster trade and commerce etc., capital stock $4,000; the New York and Rudolstadt Pottery Company, for the manufacture and sale of artistic and useful pottery, to be located in the city of Rudolstadt, Thuringia, Germany; capital $100 400.

BUFFALO.—The following bids for construction of Section C, of Trunk Sewer, were received by the Board of Sewer Commisioners, May 7: Lowry & Barton, Cleveland, Ohio, $139,361.50; A. H. Delamater, Cleveland, O., $128,204; McComas & Robbins, Cincinnati, O., $129 475; Chas. E. Williams, Buffalo, N. Y., $169,999. Contract awarded to A. H. Delamater at his bid.

NEW YORK.—The certificates of incorporation and articles of association of the Northern and Southern Telegraph Company were filed in the County Clerk's office May 15. Its capital stock is $100,000. The corporators are Ed. H. Hawkins, Chas. C. Sheldrake, Joshua Karnes, Wm. H. Hatfield, and Wm. S. Karnes.

NEW YORK.—At the office of the Board of Commissioners of the Fire Department, May 16, the contract for the furnishing of 2,000 feet of hose, was awarded to the Gutta-percha and Rubber Manufacturing Co., at $1,700; also the contract for furnishing hose, a new boiler to fire engine No. 6, and making repairs to said engine, was awarded to Clapp & Jones Manufacturing Company, at $1,300.

NEW YORK.—At the Department of Docks, May 21, the following contracts were awarded: For repairing pier (new) 43, North River, to Ryan & Cody, for $31,061; for repairing shed on pier (new) 43, North River, to Dever & Coddington for $66,000; for painting shed on pier (new) 43, North River, to Joseph D. Bliss, for $22,037. At the Department of Public Works, the following contracts were awarded, May 16: Sewer on 1st ave., between 13th and 14th sts., to Lawrence Rock, $1,188; sewer in 29th st., between 1st ave. and East River, Nutt & Kearns, $3,537.72; sewer in 125th st., between Boulevard and 10th ave., Lawrence Rock. $5,158; sewer in 127th st., between 8th ave. and Avenue St. Nicholas, Nutt & Kearns, $1,136; paving 70th st., from 1st to 2d aves., with trap block pavement, Wm. A. Cummings, $6,741.15; paving 97th st., from 1st to 2d aves., with trap block bavement, and laying crosswalks, Charles Guidet, $5.118.68; paving 97th st., from 2d to 3d aves., with granite block pavement, Charles Guidet, $5,065.12; paving 109th st., from 1st to 2d aves, with granite block pavement and laying crosswalks, Dennis McGrath, $4,827.20; paving 121st st., from 4th to Madison aves., with granite block pavement, Charles Guidet, $3,523.90; paving 127th st., from 7th to 8th aves., with granite block pavement, and laying crosswalks, Thos. Murray, $5,823.82; paving 128th st., from 7th to 8th aves., with granite block pavement, and laying crosswalks, Thos. Murray, $5,840.53.

PHILADELPHIA —Chief Engineer Ludlow suggests, in a report to the Water Department, the completion of East Park Reservoir and connections, at an estimated cost of $1,200,000. The completion of the new Cambria Basin and connections, at an estimated cost (exclusive of land damages) of $720,000. The completion of the new basin at Mount Airy at a cost (exclusive of land damages) of $225,000.

POINT PLEASANT CITY, N.J.—A company, with the title of the Point Pleasant City Water Company, has been organized to supply this section of the sea-coast with water.

GOVERNMENT WORK.

Custom House, etc., Toledo, Ohio.—Synopsis of bids, for labor and materials, opened May 16, 1883: Edward Moline, $49.000; Geo. O. Cooke, $40,900; Davidson & Marshal, $36,694; Miles, Cramer & Horn, $42,000; Belknap & Dumesne, $65.500; Edmund Knapp, $59,000; M. A. McGowan, $43,000; D. McCarty, $51,400. Davidson & Marshal awarded the contract.

Custom House, etc., St. Louis, Missouri.—Synopsis of bids for iron railing for areas; advertisement of April 14, 1883, opened May 4, 1883: Christopher & Simpson, St. Louis, $1,614; J. H. Van Dorn, Cleveland, $1,067.72; Kinsely Miller, Chicago, $2,088; Snead & Co., Louisville, $1,118; Champion Iron Fence Co., Kenton, O., $1,213.25; Hugh Ketcham. Indianapolis, $1,097.60; Ætna Iron Works, Quincy, Ill., $896; Sherfe Kokur, St. Louis, $1,600; Stupp Bros., $1,882.75. Ætna Iron Works was awarded the contract.

The Potomac Flats Improvement.—Bids were opened, May 16, at the office of Major Peter C. Hains, for filling about six acres of the Potomac flats, in the vicinity of Easby's Point: Andrew Gleason, 29 cents per cubic yard; M. A. McGowan, 29⅙ cents; J. A. Blundon, 29 cents; Jno. Cudmore, $33\frac{49}{100}$ cents; Wm. H. Mohler, 45 cents; Albert Gleason, 34½ cents. and Wm. Buckley, 34 cents. It is estimated that the amount of material to be removed will be about 49,000 cubic yards.

The Commercial Underground Electric Company, of this city, filed articles of incorporation May 17.

The Pneumatic Clock Co., of New York, have secured an order for 200 clocks for the Produce Exchange.

Mayor Edson's cabinet have requested Governor Cleveland to veto the Roesch bill, preventing the Board of Health of this city from prohibiting the use of stoneware pipe, which, as we go to press, is under the Governor's consideration.

The Charing Cross and Waterloo Electric Railway Company, has let a contract for the construction of a tunnel two-thirds of a mile long under the Thames River. The Messrs. Siemens have contracted to operate the railway for $25,000 a year, and one-fifth of the gross receipts in excess of $100,000.

SEWERS IN FLAT DISTRICTS.

The Lancet publishes the following letter from Robert Rawlinson, C. B., Chief Engineer Inspector of the Local Government Board.

SANITARY CONDITION OF CALCUTTA.

To the Editor of "The Lancet."

SIR: The inclosed letter was written at the request of Dr. Mouat, on the state of the sewers and drains at Calcutta, as detailed in *The Lancet* of the 24th inst. If you wish to use the letter it is at your service,

I am, Sir, yours truly,

R. RAWLINSON.

DEAR DR. MOUAT: I have looked over the remarks in the *Overland Mail* (Calcutta), of January 9, 1883, as to the condition of the main sewers and drains in that city. It appears that certain outlet sewers are large, and that tributary sewers and drains contain sediment, and are offensive. There are also statements that sewage sediment is allowed to accumulate both in the large main sewers and in the tributary sewers and house drains, consequent on absence of flushing, disease in excess, especially cholera, being attributed to the stenches from the sewers and drains. The large main sewers connect with the tidal river. There are about thirty-four miles of tributary sewers, and it said about fourteen million gallons of water per day pass out of the sewers. It is difficult to advise as to works in India other than on general principles. The following remarks and suggestions must therefore be taken for what they may be worth—namely, as the opinions of one who has had a wide experience, and who also has paid much attention to the subject. As a rule surface water in a tropical climate ought not to be carried away through sewers, as these should be proportioned to the volume of sewage. Natural watercourses may be improved, but should not be converted into sewers. Sewers formed in a flat district, and porous subsoil, should be of the best material; the bottom of the trench should be made watertight to prevent leakage of the fluids of sewage. The sewers and drains, in construction, should be absolutely true in line and in gradient, and should also be absolutely watertight, as, if not, the fluids will escape at the joints, leaving sediment to ferment and putrefy. All sewers and drains should be regularly flushed at short and regular intervals, as the ordinary flow of sewage is not, in all cases, in flat sewers, sufficient in volume to remove the sediment. Sewers and drains may be flushed each day, from an automatic flushing chamber, with a comparatively small volume of water, as under:—

DIAMETERS OF SEWERS AND DRAINS.

	Diameters.	Gallons for one foot.
Pipes	6 inches.	[illegible]
"	9 "	[illegible]
"	12 "	[illegible]
"	18 "	[illegible]
"	24 "	[illegible]

The above volumes of water may be liberated through the drains and sewers in from three to five minutes. To remove old deposits the flushing should be repeated as fast as the flushing tanks can be filled until the drain or sewer has been cleared. If the drains and sewers leak into the the subsoil, flushing may, in some cases, cause damage by washing away the sandy subsoil. I know of no remedy but repairs at such points with Portland cement. Sewers and drains in a flat district require unceasing attention in any climate, but under the climate of Calcutta unceasing special attention will always be necessary. Sewers and drains must have full means for ventilation that any gases of decomposing refuse may be dispersed and diluted in the open air. Stenches are offensive in the open air, but they do not kill, as when admitted within inhabited houses. If sewer and drain flushing has been neglected in Calcutta, greater attention to this necessary process will tend to reduce the nuisance caused by the unflushed and foul drains and sewers.

I am Sir, yours truly,

ROBERT RAWLINSON, C.B.

Chief Engineer Inspector, Local Government Board. Member of the Army Sanitary Committee.

PHILADELPHIA ENGINEERS' CLUB.

At the meeting, May 5, Mr. C. G. Darrach spoke with reference to the relative quantity of water at the top and bottom of deep reservoirs, and discussed the methods of meeting the difficulty encountered in the accumulation of impurities below the surface. A new method of manufacture of corrugated boiler tubes was discussed by Mr. George S Strong. The progress and condition of the manufacture of artificial fuels was sketched by Mr. E. H. Lorsean. Mr. T. M. Cleemann exhibited a map and profile of the Southern Pacific Railroad in California, showing where it crosses the dried-up bed of a lake, and attaining a depth below the surface of the Pacific Ocean of 266 feet. He also showed a number of photographs of the Tehachapi Pass on the same railroad near San Fernando. In order to attain the summit with a sufficiently reduced grade, the line was "developed," advantage being taken of a conical hill to wind about it in the form of a helix, crossing itself, and continuing on its way with several meanderings.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

The Society met at 8 P. M., May 16, Vice-President Wm. H. Paine in the chair, John Bogart Secretary.

Detailed announcements were made as to the convention, to be held at St. Paul and Minneapolis, beginning June 19, 1883. The paper recently published in *Transactions*, "On the increased efficiency of railways for the transportation of freight," was discussed at length by Mr. O. Chanute, and also by Messrs. Cooper, Forney, Emery, Hamilton and Shiner. Mr. F. J. Cisneros, M.Am. Soc., C.E., who recently visited the Isthmus of Panama, presented an informal statement of the progress of the work upon the Panama Ship Canal. He said that the line had been completely staked, cross sections taken, and the location made and stakes set for definite work for a large portion of the line. The contractors, Messrs. Haven & Co., for dredging the canal from Colon, have their first dredge in place, and will commence work directly. Much money has been spent in the purchase of materials for the work, including excavators, dredging-machines, and portable track. The company has ordered fourteen American locomotives, of which nine are now in service. Hospitals have been erected at Panama, and the health of the laborers is very much better than has generally been understood.

SEWAGE POLLUTION OF THE THAMES.

The Royal Commission on the Metropolitan Sewage Discharge, which was appointed last June in deference to reiterated complaints of the foulness of the Lower Thames, will probably complete its difficult and tedious task before long. Fortunately the Commission is an excellent one. With Sir John Coode, Mr. Abernethy, and Colonel Ewart as engineers, and Prof. Williamson, Dr. De Chaumont, and Dr. Stevenson as chemists, we have what dramatists would call a very strong cast. The inquiry has to a certain extent a judicial character. It has resolved itself into a kind of duel between the Metropolitan Board of Works, who devised and defend the present system, and the Corporation of London who, as port sanitary authority, lead the attack on what they hold to be a foul and disgraceful

Digitized by Google

nuisance. Each side is represented by counsel, and each side is doing what it considers its duty in bringing forward all the evidence it can collect. As to some of the facts, there can, of course, be no dispute. The sewage of nearly all London is thrown into the Thames, between Woolwich and Greenhithe, and no one can deny that the river is fouled by the excreta of nearly four millions of people. But the Metropolitan Board, who created the present outfalls, contend that the pollution is not of a serious kind, that it is rapidly removed by natural oxidation, and that if any evil arises from the sewage pollution it is not an actual, but merely a sentimental, one. At present, almost all the witnesses called have been on the side of the Corporation, and have testified to the existence and causes of the nuisances. Of the scientific witnesses there were Dr. Collingridge, Medical Officer of the City, Dr. Lionel Beale, and Dr. Corfield, as physicians; Mr. Baldwin Latham, Mr. Mansergh, Mr. More, Mr. Birch, and Professor Unwin, as civil engineers; Dr. Tidy, Professor Frankland, Mr. Way, Mr. Heaton, and Professor Tuson, as chemists; Mr. Whitaker, as geologist; and Mr. Symons, as meteorologist. The evidence given by these gentlemen was extremely elaborate, and will require careful examination when the time comes. But the other side has still to be heard, and will be represented by men of the highest scientific reputation. We prefer to reserve further remarks until we hear what Dr. Dupré, Mr. Able, Professor Voelcker, and the rest of their colleagues have to tell us. —*Lancet.*

THE PINGSUEY TEAS.

The injunction issued two weeks ago, stopping the sale and the removal of some 3,600 packages of Pingsuey teas, has been amended so as to include the proprietors of stores, F. W. Bampton & Co., 206 South street, where it is said about 1,000 packages belonging to a Boston firm, who were not mentioned in the former papers, had stored it. It was reported that these packages had been sold at private sale, and no notice having been served on the store keeper, it was the intention to remove them and give the authorities the slip. The action was taken to prevent such a contingency.

INDIAN TEAS.

The following is an analysis of a lot of Indian teas which were sold at auction on May 17.

Extract	37.80 per cent.
Total ash	6.24 " "
Ash soluble in water	4.28 " "
Ash insoluble in water	1.96 " "
Ash insoluble in acid	0.16 " "
Insoluble leaf	47.12 " "

The report also states that the tea contains neither foreign nor exhausted leaves, nor coloring matter.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

M. Howard; b, G. Arkle, st contractor.

MISCELLANEOUS.

BROOKLYN, N. Y.—The Board of Supervisors of Kings County, the 17th inst., passed resolutions directing the committee on county farm to consider the selection of a tract of 50 to 100 acres on which a new asylum for the insane may be built.

CHICAGO, ILL.—Theodore G. Springer has had plans made for a four story apartment house, at Division street and Lasalle av, cost $18,000. An apartment house house costing $16,000 will be built for J. F. Walch, by John Otrer, architect; also a three story residence for D. Donegan, cost $30,000, and four flats for C. P. Holmberg and Blomgren Bros., of brick, costing $40,000.

CHARLOTTE, MICH., will have a county court house costing $75,000.

GRAND RAPIDS, MICH.—The Y. M. C. A. intend to put up a building on property recently bought.

RACINE, WIS.—A large stone church is begun for the Roman Catholic denomination.

The highest building in New York, perhaps in this country, is to be built on the northwest corner of 57th st and 7th av. The owner is Mr. Thomas Osborn, and the architect Mr. J. E. Ware. The proposed structure will be 150 x 94 in size, 200 feet high from the tower to the ground, and will be entirely fire-proof. It will be used as an apartment house, and will accommodate 38 families. The cost will exceed $650,000.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

269,886. COCK. JAMES SEMPLE. Cincinnati, Ohio. Filed Mar. 28, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—1. In combination with the main valve D and a controlling-valve, the regulating-duct E, adjustable in its delivery by means of plug L, substantially as and for the purpose designated.

2. In the described combination with main opening C and its valve D, and with the duct E in said valve, adjustable in its delivery by means of plug L, the double conical controlling-valve H H^1 H^{11} in the corresponding double-seated chamber P, with wasteway T, substantially as set forth.

269,912. FAUCET. JOHN L. BERRY and SHADRACK GLADNEY, Antelope, Cal. Filed July 20, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—A spigot provided with slotted pipe A and a supplemental opening, and a tube and float adapted to communicate with the interior of the vessel above the liquid, in combination with the elastic retaining-band F to hold the tube and float within the slotted pipe A, as set forth.

269,921. CISTERN FOR WATER-CLOSETS. JOHN DEMAREST, New York, N. Y. Filed Aug. 21, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—1. The combination, with a water-closet cistern, of two valves, mechanism for raising such valves, floats, and levers for holding up such valves and for allowing the same to drop automatically when the water in the cistern descends to the two different levels, substantially as set forth.

2. The combination, with the cistern-valve, of a stem having a neck, a guide for such stem, a float, and a lever having a pawl to engage such stem and support the valve, substantially as set forth.

3. The combination, in a water-closet cistern, of two valves, two floats, and means for holding up the valves and for allowing the valves to drop automatically at different levels of the water, a lever and weight and catches on the lever at opposite sides of its fulcrum for alternately raising the valves, and means for disconnecting the catches, substantially as set forth.

4. The combination, with the water-closet cistern, of a valve, a stem, a guide for the stem, latches for lifting the valve and stem, a float, lever and pawl for holding up the valve and for allowing it to drop automatically, substantially as specified.

5. The combination of the water-closet cistern and the valve, the tubular stem to the valve having an open flaring upper end, for the purposes set forth.

270,084. MERCURY SEAL-JOINT TRAP FOR BATH TUBS, ETC. ABRAHAM EDWARDS, Asbury Park, N. J., and SAMUEL J. VAN STAVOREN, Philadelphia, Pa., assignors to said Edwards. Filed May 22, 1882. (No model.) Issued January 2 1883.

Claim.—1. A stench-trap composed of a body having lateral cleaning out opening and an eduction pipe, a top or cover for said body, having an induction pipe, and an inverted cup suspended within said body between the induction and eduction pipes, and provided with external vertical ribs or scrapers, substantially as shown and described.

2. A stench-trap composed of a body, a top or cover therefor, a cleaning out opening, eduction and induction pipes, and an inverted cup suspended between said pipes and adapted to be rotated to effect a cleansing of the trap, substantially as shown and described

3. The combination of body A, top A^1, and inverted cup D, the body A having lateral or cleaning out opening a^6, provided with the removable stopple C, mercury holding groove or trough a^4, eduction pipe a^2, flanged at a^3, and the top A^1, having induction pipe a^1, substantially as shown and described.

4. The combination of body A, having lateral opening a^6, provided with stopple C, mercury holding trough or groove a^4, and eduction pipe a^2, the top or cover A^1, having induction pipe a^1, and the inverted cup D, suspended between said induction and eduction pipes, and provided with vertical ribs d^2, substantially as shown and described.

5. A stench-trap composed of a top, with induction pipe, a body having eduction pipe, and a trough or groove with a mercury seal, and an inverted cup between said pipes, the lower edge of the cup dipping into said sealing medium, and said cup being of such size or diameter that the horizontal area or width of the space between the cup and the body of the trap is less than the width or extent of the mercury or sealing medium in said groove or trough, substantially as shown and described.

6. In a stench-trap, the combination, with a body having an eduction pipe and a top therefor, having an induction pipe, of an inverted cup between said eduction and induction pipes, adapted to be rotated on its bearings to cleanse the wall or sides of the trap, substantially as shown and described.

7. The stench trap herein shown and described, provided with cup D, having external vertical ribs, d^2, substantially as set forth.

270,066. COCK AND FAUCET. FRANCIS HICKMAN, New York, N. Y. Filed April 19, 1882. (No model.) Issued January 2, 1883.

Claim.—As a new and improved article of manufacture, a cock or faucet having a bead or shoulder on its nozzle, in combination with a coupling ring of flaring form having a screw thread in it, substantially as described.

270,111. TRAP FOR WASH STANDS, etc. CHARLES F. PIKE, Philadelphia, Pa., assignor to the National Anti-Sewer Gas, Co., Camden, N. J. Filed July 31, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—1. A stench trap for wash basins, etc., provided with a pipe connected to the water supply pipe of such fixtures, whereby a continuous flow of water is conducted into said trap, in combination with means for regulating the volume of such flow, substantially as set forth.

2. A stench trap for wash basins, etc., provided with a disinfectant-containing pocket, and a pipe leading thereto and connected with the water supply pipe of such fixtures, whereby a continuous flow of water is passed to said pocket to provide a running disinfectant seal for said trap, substantially as set forth.

3. The trap A, having induction pipe B, eduction pipe B^1, partition C, and curved bottom a^1, in combination with a water supply pipe, F, substantially as shown and described.

4. The trap A, having induction pipe B, eduction pipe B^1, partition C, curved bottom a^1, and pocket D, in combination with a water supply pipe F, substantially as shown and described.

270,080. WATER CLOSET. JOHN KELLY, Chicago, Ill., assignor of two-thirds to Thomas Kelly and James Kelly, same place. Filed June 28, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—1. In a water closet, a valve substantially as described, and connected by pipe N with the service tank O, such tank having stop valve *o*, float valve *p*, and air escape pipe P, the whole to oper. te substanstantially in the manner herein set forth.

2. In a water closet, a valve substantially as described, and connected by pipe N with the service tank O, such tank having float valve *p*, and air escape pipe P, that is interposed by a chamber T, containing disinfecting material, all substantially as and for the purpose described and shown.

269,656. STEAM-TRAP. ARTHUR L. FISH, San Francisco, Cal. Filed Oct. 19, 1882. (No model.) Issued Dec. 26, 1882.

269,676. PORTABLE PUMP. WILLIAM J. JOHNSON, Newton, and FRANK C. JOHNSON, Boston, Mass.; said Wm. J. Johnson assignor to the National Manufacturing Company, Worcester, Mass. Filed March 23, 1882. (No model.) Issued Dec. 26, 1882.

269,690. BOILER AND FURNACE. JAMES H. MACKINTOSH, Paterson, N. J. Filed April 26, 1882. (No model.) Issued Dec. 26, 1882.

269,720. FURNACE. CLAUS RUSSMANN, Hamburg, Germany. Filed Oct. 5, 1882. (No model.) Issued Dec. 26, 1882.

269,757. INCANDESCENT-ELECTRIC-LAMP HOLDER. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 23, 1882. (No model.) Issued Dec. 26, 1882.

269,759. ELECTRIC INCANDESCENT LAMP. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Dec. 13, 1881. Renewed Sept. 13, 1882. (No model.) Issued Dec. 26, 1882.

269,761. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 13, 1882. (No model.) Issued Dec. 26, 1882.

269,768. TUBULAR DRILL FOR BORING ARTESIAN WELLS. JAMES P. WINTZ, Charleston, W. Va. Filed Nov. 4, 1882. (No model.) Issued Dec. 26, 1882.

269,798. GAS-GENERATOR. JAMES E. LEADLEY, Camden, N. J., and JOHN HANLON, New York, N. Y., assignors to the United Gas Improvement Company, Philadelphia, Pa. Filed July 12, 1882. (No model.) Issued Dec. 26, 1882.

269,805. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. HIRAM S. MAXIM, Paris, France. Filed Aug. 31, 1882. (No model.) Issued Dec. 26, 1882.

269,807. INSULATING-WIRES. LEWIS H. MCCULLOUGH, Richmond, Ind. Filed July 21, 1882. (No model.) Issued Dec. 26, 1882.

269,813. GAS-ENGINE. LEWIS C. PARKER, Robinson, Kansas. Filed Aug. 29, 1882. (No model.) Issued Dec. 26, 1882.

269,827. AUTOMATIC SAFETY ATTACHMENT FOR STEAM-BOILERS. CHARLIE CASE, Emlenton, Pa. Filed Aug. 2, 1882. (No model.) Issued Jan. 2, 1883.

269,833 and 269,834. VAPOR-BURNER. ZEBULON DAVIS, Canton, Ohio. Filed Feb. 18, 1882. (No model.) Issued Jan. 2, 1883.

269,849. COMPOUND FOR THE MANUFACTURE OF ARTIFICIAL STONE. JOSEPH A. GREER, Galveston, Texas. Filed July 3, 1882. (No specimens.) Issued Jan. 2, 1883.

269,868. ELECTRIC WIRE-CABLE. JAMES MACKINTOSH, Philadelphia, Pa. Filed June 16, 1882. (No model.) Issued Jan. 2, 1883.

269,878. HEATING-FURNACE. HENRY W. MICHAEL, Denver, Colo. Filed Apr. 13, 1882. (No model.) Issued Jan. 2, 1883.

269,888. ELECTRIC MOTOR. WILLIAM L. SILVEY, Castleton, Ind. Filed Mar. 18, 1882. (No model.) Issued Jan. 2, 1883.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Registrars will please notify box 578, Washington, D. C., when their supply of blank Postals is running low, in order that they may be kept supplied.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

Notes and Abstracts.

Of an urban population of 6,796,930, there died, during the week ending May 12, 2,847 persons, which is equivalent to an annual death rate of 21.7 per 1,000; a slight decrease from that of the preceding week, viz., 22.0.

For the North Atlantic cities the rate was 24.0; for the Eastern cities, 22.4; for the lake cities, 18.2; for the river cities, 17.3; and in the Southern cities, for the whites, 20.5, and for the colored 41.2 per 1,000.

Of the whole number of deaths, 34.5 per cent. were under five years of age.

Accidents caused 3.4 per cent. of all deaths. Consumption caused 13.8 per cent. of all deaths. In the North Atlantic cities it caused 15.0; in the Eastern cities 14.4; in the lake cities 11.0; in the river cities 12.5, and in the Southern cities, for whites, 14.4, and for colored 15.5 per cent.

Croup caused 1.2, diarrhœal diseases 2.8, and diphtheria 2.9 per cent. of all deaths. In the Southern cities diarrhœal diseases caused 9.2 per cent. of all deaths among the whites, and 8.2 per cent. among the colored. In the North Atlantic cities diphtheria caused 4.8, in the Eastern cities 2.6, in the lake cities 4.9, and in the river cities 2.5 per cent. of all deaths.

Typhoid fever caused 1.1, malarial fevers 1.2, and scarlet fever 3.2 per cent. of all deaths. The highest rate from typhoid was in the river cities (2.5). The highest rate from scarlet fever was in the Eastern cities (4.4).

Pneumonia caused 9.6, and acute bronchitis 3.3 per cent. of all deaths. In the North Atlantic cities pneumonia caused 11.8; in the Eastern cities 11.0; in the lake cities 7.1; in the river cities 7.9, and in the Southern cities, for the whites 5.7, and for the colored 6.7 per cent.

Measles caused 1.6; small-pox 1.5, and whooping cough 5 per cent. of all deaths. Of the 45 deaths from small-pox reported, 30 occurred in New Orleans.

BOSTON, MASS.—C. E. Davis, Jr., reports 39 new cases of diphtheria, 21 of scarlet fever, and six of typhoid fever.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Y. M. Franklin reports 1,369 insane patients remaining under treatment at the close of the week ending May 12. The changes during the week were: admissions 15, discharges eight and deaths three.

LYNCHBURG, VA.—Dr. Thomas L. Walker reports the prevalence of a mild form of scarlet fever among the children. Two deaths took place from the disease during the week.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 25 new cases of scarlet fever and eight of diphtheria, making a total of nine of the latter disease and 52 of the former remaining under treatment on May 12.

BALTIMORE, MD.—The Board of Health reports 187 deaths as having occurred during the week ending May 12: Males 94, females 93; under five years, 66, over 60 years, 28. Annual rate per 1,000, white 21.45, colored 37.86. Small-pox caused only one death. Violence caused six deaths, consumption 27, croup two, diarrhœal diseases two, diphtheria 11, typhoid fever one, malarial fevers five, scarlet fever 15, puerperal diseases two, pneumonia 15, bronchitis four, and whooping cough one.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports but one death, from consumption, during the two weeks ending May 12.

DETROIT, MICH.—Dr. O. W. Wight reports 25 new cases of diphtheria and 15 of scarlet fever during the week.

MICHIGAN.—Dr. H. B. Baker reports the diseases prevailing in the State during the week ending May 5 as follows: Rheumatism, bronchitis, intermittent fever, neuralgia, consumption, tonsilitis, measles and influenza. Compared with the average in the preceding six years, measles was considerably more prevalent, and malarial fevers and diphtheria less prevalent in April of this year. During the week diphtheria was reported present at seven places, scarlet fever at 19 places, and measles at 25 places.

HUDSON CO., N. J.—C. J. Rooney's report for the week ending May 5 came too late to be tabulated. There were 87 deaths, 32 of which occurred in children under five years of age. Accidents caused seven deaths, cerebro-spinal meningitis four, consumption 12, croup, one, diphtheria three, erysipelas two, typhoid fever three, scarlet fever five, pneumonia 12, bronchitis six, and puerperal diseases three. No death was recorded from diarrhœal diseases, malarial fevers, pleurisy, congestion of lungs, measles, small-pox or whooping cough.

SAN FRANCISCO, CAL.—During the month of March, there were 449 deaths as compared with 584 in the corresponding month of last year; males 294, females 155; under five years 99, over 60 years 67. Croup caused one death, cerebro-spinal meningitis one, diphtheria five, diarrhœal diseases 13, erysipelas four, typhoid fever seven, malarial fever two, scarlet fever two, consumption 76, bronchitis 14, congestion of lungs eight, pneumonia 58, puerperal fever three, and violence 23.

PROVIDENCE, R. I.—In his report for the month of April, Dr. E. W. Snow notes the very large number of deaths from four principal causes. There were 129 deaths in April, or considerably more than one-half of the whole number of deaths, from the four diseases, consumption, typhoid fever, heart disease and pneumonia. The number (40) from consumption in April was larger than ever before in Providence in any single month, with the exception of January, 1881, when there were 41 deaths. The number from typhoid fever was larger than in any former month except in November last. The number from pneumonia (33) was larger than in any previous month except in January, 1875, when there were 35 deaths, and in January, 1879, when there were 38 deaths. An epidemic of typhoid fever began in October last, declined slowly in November, and almost disappeared in January; but about March 16, another epidemic began which reached its height in about 12 days, after which it rapidly declined. Since November last the localities of 300 cases of typhoid have been systematically examined, the results of which are promised hereafter. In the meantime it is stated that every case of typhoid fever depends for its existence upon some local source of foul air, or perhaps, in some cases, of impure water. "This statement has received a most remarkable but sad confirmation from the examination of some of the best residences in the city, where there have been cases of the disease this spring."

ONTARIO, CANADA.—The *Provincial Bulletin* for the week ending May 5, notes a general increase in zymotic diseases; mumps, measles, diarrhœa, whooping cough, diphtheria and scarlet fever, all appear at least once among the six most prevalent diseases in the sanitary districts. Measles, which for a few weeks has been receding, has again risen to 7.1 of the total. Pneumonia and erysipelas have receded. Cerebro-spinal meningitis reported present last week, shows a tendency to increase.

HAVANA, CUBA.—Dr. D. M. Burgess reports 598 deaths in the city during the month of April. Thirty-two of these were caused by yellow fever, 14 by typhoid fever, two by bilious fever, four by intermittent fever, 14 by pernicious fever, two by small-pox, and 12 by measles.

During the week ending May 4 there were seven deaths from yellow fever, and one from small-pox.

RIO DE JANEIRO, BRAZIL.—During the week ending April 7, there were 114 deaths from yellow fever in the city; those which occurred in the fever hospital are not included in this number. The mortality from all causes during the week is given by Consul-General C. C. Andrews as 407, of which 13 were caused by small-pox, 13 by typhoid fever, three by typhus fever, 15 by pernicious fever, and 34 by pulmonary consumption.

During the week ending April 14, there were 119 deaths from yellow fever, exclusive of those in the Hospital Santa Isabel, in a total mortality of 371. Small-pox caused six deaths, typhoid fever 11, typhus fever one, pernicious fever 11, and consumption 38.

During the month of March 122 persons died of yellow fever in the Santa Isabel Hospital.

PERNAMBUCO, BRAZIL.—Small-pox continues to affect the death rate in this city, but it is *not* regarded as epidemic. Latest advices from Consul H. L. Atherton, dated April 16, report 9.9, and five deaths from this disease during the three preceding weeks.

BUENOS AYRES, ARGENTINE REPUBLIC.—Consul E. L. Baker reports the continued prevalence of small-pox. During the month of March 182 deaths occurred from this disease in total mortality of 699, the population being 300,000. The disease is causing great apprehensions.

ENGLAND.—During the week which ended April 28, the annual rate of mortality in the 28 great towns of England and Wales averaged 22.7 per 1,000. Leicester registered the lowest rate, 16.9, and Oldham the highest, 32.9. No death was referred to any of the principal zymotic diseases in Norwich or in Huddersfield. The 23 deaths from diphtheria in the 28 towns included 20 in London and two in Leeds. Small-pox caused one death in London, three in Leeds, three in Newcastle-upon-Tyne and two in Birmingham.

London.—Births, 2,514; deaths, 1,635. The former were 268 and the latter two below the average numbers in the corresponding weeks of the past ten years. The annual death rate was 21.6. The deaths included one from small-pox, 40 from measles, 17 from scarlet fever, 20 from diphtheria, 35 from whooping cough, one from typhus, ten from typhoid fever, 19 from diarrhœa and dysentery, and 57 from violence. The deaths referred to diseases of the respiratory organs, which had declined from 672 to 474 during the four preceding weeks, further fell to 445, but exceeded the average by 73; 259 were attributed to bronchitis and 123 to pneumonia.

SCOTLAND.—The Registrar-General's return for the week ending April 28, shows the death rate in the eight principal towns to have been 27.6. The lowest rate was given by Aberdeen, 19.5, and the highest by Glasgow, 34.6.

Edinburgh.—Total deaths 89. Rate 19.6. No death was reported from small-pox or scarlet fever. Measles caused one death, diphtheria and typhoid fever two each, diarrhœa three, whooping cough two, acute lung diseases 22 and violence one.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the Registrar-General for the week ending April 28, a summary of which is given in our mortality table.

Dublin.—Births, 186; deaths, 203; equaling the respective annual rates 27.7 and 30.2. No death was registered from small-pox, measles, scarlet fever or diphtheria. Typhus caused three deaths, and typhoid fever one, whooping cough nine, diarrhœa three, consumption 35, acute lung diseases 51 and violence three.

Belfast.—Births, 150; deaths, 104; equal to the rates 36.4 and 25.2. No death was registered from small-pox, measles, diphtheria, typhoid fever or violence. Scarlet fever caused two deaths, typhus one, whooping cough five, diarrhœa three, consumption 18, and acute lung diseases 26.

IRELAND.—During the quarter ending March 31, according to the return of the Registrar-General, there occurred in the four principal

Digitized by Google

tary districts 6,614 births and 7,040 deaths, the former equal to an annual rate of 30.1, and the latter to a rate of 32.9. Small-pox caused four deaths, measles 56, scarlet fever 120, typhus 95, whooping cough 258, diphtheria six, typhoid fever 72, diarrhœa and dysentery 142, consumption 849, acute lung diseases 1,981 and violence 98. The death rate was lowest in Sligo, 20.4, and highest in Lurgan, 40.1 per 1,000. Measles prevailed in Lurgan and Armagh, causing death at the annual rate of 4.3 per 1,000 in the former and 6.0 in the latter town.

Dublin. Births, 2,700; deaths, 2,986, equal to the respective ratio 30.9 and 34.2. Measles caused one death, small-pox none, scarlet fever three, typhus fever 56, whooping cough 153, diphtheria one, typhoid fever 46, diarrhœa and dysentery 47, consumption 357, acute lung diseases 824 and violence 54.

Belfast. Births, 1,814; deaths, 1,700, equal to the annual rate 33.9 and 31.8. Small-pox caused three deaths, measles 18, scarlet fever 101, typhus eight, whooping cough 82, diphtheria one, typhoid fever 16, diarrhœa and dysentery 46, consumption 229, acute lung diseases 504 and violence 27.

PARIS, FRANCE.—The Bulletin for the week ending April 25 shows 1,330 deaths to have occurred, being at the annual rate of 30.86 per 1,000. Of the deaths, 700 were of male persons and 630 of female persons; 343 of children under five years and 310 of persons over 60 years of age. Typhoid fever caused 37 deaths, small-pox 12, measles 40, scarlet fever two, whooping cough 16, croup and diphtheria 44, dysentery two, erysipelas six, puerperal infection five, consumption 267, acute bronchitis 32, pneumonia 138 and violence 29.

On April 22 there remained under treatment in the hospitals of the city 134 cases of small-pox, 196 of fever and 37 of diphtheria. The births during the week numbered 1,233.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

MR. C. N. DOUGLASS' SCHOOL FOR BOYS

Thorough preparation for the best Colleges and Scientific Schools and for business. Pupils received at any time. The classes are small, and much of the teaching individual. References furnished on application.

No. 1298 Broadway cor. Thirty-fourth St., N. Y.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Proposals.

PROPOSALS FOR FUEL, FORAGE AND STRAW.

DEPOT QUARTERMASTER'S OFFICE,
HOUSTON ST., COR. GREENE, NEW YORK CITY, *May* 1, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, on the 31st day of May, 1883, at which time and place they will be opened in presence of bidders, for furnishing and delivering Fuel, Forage and Straw required at *New York City, Willet's Point, N. Y. H.*, and *David's Island, N. Y. H.*, during the fiscal year ending June 30, 1884.

The Government reserves the right to reject any or all proposals, or to accept as may be most advantageous to the Department.

A preference will be given to articles of domestic production, conditions of price and quality being equal, and such preference will be given to articles of American production produced on the Pacific coast to the extent of the consumption required by the public service there.

Blank proposals and printed circulars stating the kind and estimated quantities required at each post, and giving full information as to the manner of bidding, conditions to be observed by bidders, and terms of contract and payment will be furnished on application to this office.

Envelopes containing proposals should be marked:—"Proposals for Fuel, Forage and Straw," and be addressed to the undersigned.
HENRY C. HODGES, *Lt.-Col. and D. Q. M Gen'l, U. S. A.*

PROPOSALS FOR CONSTRUCTION OF POST HOSPITALS.

OFFICE OF CHIEF QUARTERMASTER, DEPARTMENT OF THE EAST,
GOVERNOR'S ISLAND, N. Y. H., *May* 11, 1883.

Sealed proposals in triplicate, subject to the usual conditions, will be received at this office, until 12 o'clock, noon, New York time, on the 31st of May, 1883, at which time and place they will be opened in the presence of bidders, for the construction of a twelve bed hospital, at *Fort Schuyler, N. Y. H.*, in accordance with plans and specifications, which can be seen at the office of the undersigned.

One copy of this advertisement should be securely attached to each triplicate proposal, and be mentioned therein as comprising a part of it.

Blanks for proposals, and information as to the manner of bidding, etc, can be obtained at this office. Proposals must be accompanied by a bond, with two sureties, in the sum of two hundred dollars. A proposal not accompanied by such a bond will not be considered.

Envelopes containing proposals should be marked "Proposals for construction of Post Hospital," and addressed to the Chief Quartermaster, Department of the East, Governor's Island, N. Y. H.

The Government reserves the right to reject any or all proposals.
C. G. SAWTELLE,
Deputy Quartermaster General, U. S. A., Chief Quartermaster.

THE "JUNIOR" ECLIPSE
Pipe Cutting Machine.

This tool meets the requirements of those who have use for a Screwing Machine light enough to be readily carried about, sufficiently powerful in its gearing (18 to 1) to work easily, and strong enough to bear rough usage. All of these points, with the very important one of MODERATE COST, are to be found in the "JUNIOR" ECLIPSE MACHINE.

It will cut off and thread Pipes from ¼ to 2 inch, inclusive; can be erected on any fence, box or plank in five minutes, by simply boring two ¾ holes, and weighs complete, about 125 pounds. It has no complicated parts and nothing to break or get out of order, and will do the work of a tool costing twice its price.

We offer it, as also the large size "Eclipse," cutting 2½ to 4 inch Pipes, with the understanding that if not found satisfactory after a fair trial, it may be returned to us, within thirty days, and the purchase money will be refunded.

PRICE, Complete with Dies ¼ to 2 inches, $60.00.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

A New Article of Manufacture.

CAST LEAD CISTERNS.

We have purchased patents that enable us to manufacture

CAST LEAD LINED WATER CLOSET CISTERNS.

The following advantages are claimed:

1. *They are cast entirely in one piece from Virgin Pig Lead, without any Seam, Joint or Solder. They are supported in Strong Wood Cisterns, and are not liable to burst, as would Iron Cisterns, if exposed to frost.*

2. *They are cast stronger at the Corners, tapered each way, and it is believed will last longer than any Cistern made from Sheet Lead, burnt or soldered together.*

3. *The Working Parts have Brass Bearings. Should the Cistern get damaged, it can be easily repaired, whereas the Iron ones would have to be replaced.*

4. *Should the Cistern be pulled out, or repaired, the metal has some value, whereas broken Iron Cisterns are comparatively worthless.*

5. *These Cisterns will not rust and the water from them will not discolor the bowls of the Water Closets.*

6. *The rush of water from a Wooden Cistern, lined with lead, occasions less noise than from a Cast Iron one.*

We are now making five different styles and will be able to furnish them adapted for any style of Water Closet. Plumbers having unexecuted contracts requiring cisterns are invited to call and examine those we have thus far made.

We designate them as follows:

No. 1 *"Em Ess" Lead Cistern.*
(This is intended for flushing Hopper Closets, has an independent overflow as required by the New York City regulations.)

No. 2 *"Em Ess" Lead Cistern.*
(This is the same as the No. 1, except that it has the overflow arranged to go to the Hopper, as is the usual practice in this country.)

No. 3 *"Em Ess" Lead Cistern.*
(Is the same as No. 2, with the addition of a service box of a size adapted for use over a pan closet.)

No. 4 *"Em Ess" Lead Cistern.*
(Is arranged to discharge a given amount of water by means of a syphon. The action of the syphon being started by the pulling up of a valve, a flush is sure to be obtained, since if for any reason the syphon should fail to act, a flush can be secured by holding the pull a few seconds as with the ordinary cisterns. This cistern may be used with the Hopper and wash-out style of water closets, and can be arranged to make a flushing apparatus for urinals.)

No. 5 *"Em Ess" Lead Cistern.*
(Is a double compartment waste-preventing cistern; constructed so that not more than three gallons can be drawn at one pull of the handle. It is also provided with the independent overflow, and arranged to secure the minimum tax of the New York Water Department.)

No. 1, 2, 3 and 4 are made 19 x 11 x 7 inches, over-all measure, and hold three gallons.

No. 5 is 19 x 11 x 13 inches. Experience has shown that for general use this size is ample, since when the water pressure is good, it is quickly filled through the ball-cock, and when the pressure is inadequate, large storage tanks must be provided for the upper parts of buildings from which water for all the lower fixtures can be taken. In either case it will be apparent that the three-gallon size, supplied with a good pressure of water, is ample, and admits of being inclosed in a neat cabinet, thus avoiding an unsightly tank in a bath-room, where water-closets are often placed, and where the usual cistern has often been objected to by householders.

We designate these Cisterns as follows:

No. — "Em Ess" Lead Cisterns.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted. Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes. Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

READERS WILL CONFER A FAVOR BY MENTIONING THE SANITARY ENGINEER WHEN THEY COMMUNICATE WITH ADVERTISERS.

DEMAREST'S

Patent VALVE WATER CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

We take great pleasure in calling the attention of our customers and all interested in fine sanitary work to the "Premier" water-closet, which is in all respects the same as our "Hygeia" Cistern Closet, only it is fitted with a large Valve (one inch waterway) suited to all pressures.

The valve is of the simplest kind, reliable and perfect in operation; it is positive in action, being operated by lever as shown in cut. The flushing rim ensures the wash of every part of the closet, and what is a most important feature, this is accomplished almost entirely without noise.

THE "PREMIER."

SIDE-OUTLET VALVE CLOSET.

THE "DEMAREST."

SIDE-OUTLET VALVE CLOSET.

The "Demarest" is undoubtedly the most popular closet of the kind in the market. Its large and largely increasing sale being proof of its superiority where a first-class article is required at a moderate price.

THE "CLIMAX."

DIRECT-OUTLET VALVE CLOSET.

The above is a very reliable direct-outlet closet, and has given good satisfaction wherever it has been used. The outlet is full four inches, which is an important feature in this style of closet.

We furnish Enameled Iron or Imported All-porcelain Slop Safes to fit all the above Closets.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, SENT ON APPLICATION.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

And may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

THE ELEGANT STATIONS OF THAT
Magnificent line of railway, the

NEW YORK, WEST SHORE AND BUFFALO,

Are to be furnished with water closet drainage by the Durham House Drainage Co., 187 Broadway.

The Durham System of House Drainage has been adopted for the new building for the

SCHOOL OF MINES,

COLUMBIA COLLEGE.

The splendid private stable of Wm. Pickhardt, Esq., East 75th Street, is now being furnished with drainage on the Durham System.

The use of inferior materials and workmanship for house drainage is a serious error of judgment. The adoption of the Durham System insures a saving of LIFE, HEALTH and MONEY; there will be no repairs required in a lifetime.

Examine the work personally, or send for the ILLUSTRATED PAMPHLET published by the Company.

MINTONS' TILES, *Glazed and Unglazed.*

For VESTIBULES, HALLS, HEARTHS, etc., and for Exterior Decoration. Also, Plain White, and Tinted Tiles, for KITCHENS, BATH ROOMS, WATER CLOSETS, etc.
Also, PLUMBERS' MATERIALS of all kinds.

MILLER & COATES,
279 PEARL STREET, near Fulton St., NEW YORK.

Otis Brothers & Co.

Standard Hydraulic Passenger and Freight Elevators, as used in the largest buildings and adopted by the United States Government, can be seen at United Bank Building, Liverpool & London & Globe Insurance Co. Building, Boreel Building, Post Building, in Hanover Street, etc.

Safety Steam Elevators for all purposes, such as Factories, Warehouses, Stores, Mills, Mines, Blast Furnaces, etc., etc.

☞ *Circulars sent on application.*

WORKS AT YONKERS, N. Y.
OFFICE AT 348 BROADWAY, NEW YORK.

HEAT SAVING and VENTILATING

GRATE,

EDWIN A. JACKSON & BRO.,
77 Beekman Street, New York.

THE CHEERFUL, COMFORTABLE FIRE OF THE OPEN GRATE. THE HEATING POWER OF THREE ORDINARY GRATES. CAN BE ARRANGED TO HEAT ROOMS ON TWO FLOORS. AN UNLIMITED SUPPLY OF PURE WARMED AIR. MADE OF THE FINEST FINISH IN NICKEL, BRONZE OR BRASS.

☞ Send for descriptive circulars and designs.

American Photo-Engraving Co.

13 & 15 VANDEWATER ST., NEW YORK.

Make Type Metal Plates for illustrating Catalogues, Books, Papers, etc. From Drawings in Pen and Ink, Pencil or Crayon, Wood or Steel Engravings, Lithographs and Photographs, same size, reduced or enlarged. See Illustrations of this Paper.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

THE ABOLITION OF MALARIA.

During the last few years an interesting experiment has been in progress in the vicinity of a Trappist convent on the Campagna, near Rome, at a station known as the Three Fountains, which for a number of years has been pre-eminently unhealthy. So much so indeed that it was practically impossible for anyone to live there during the summer and autumn, and a visit to it, except in midwinter, ranked as a dangerous expedition.

At last the monks undertook to drive away the malaria by means of drainage, the culture of the vine, and especially by extensive planting of the eucalyptus. The effect produced was good, the level of the sub-soil water was lowered several feet, the monks were able to remain throughout the year, and the Government taking a strong interest in the experiment sent in 1880 a large gang of convicts to extend the work.

All went well in 1881; there was very little sickness among the convicts or their guards, the plantations were largely extended and many believed that the problem of the abolition of malaria had at last been solved. But in 1882, while the malarial fevers were much less prevalent and less severe throughout the Campagna, which diminution was supposed to be due to an unusually dry summer and cool autumn, there was one exception to this, and that was, most unfortunately, the Three Fountain station.

Every person who remained at this place during the summer and autumn of 1882 suffered from malarial fever.

Among the monks the fever assumed a mild form, among the guards it was unusually severe, and most of them had to be promptly relieved and sent elsewhere. Of the prisoners some had mild attacks, others very severe.

Upon this condition of things, Professor Tommasi Crudeli, the well-known author of the *bacillus malariæ* theory, remarks that "the object of sanitary work as regards malaria is to modify the physical conditions or the chemical composition of the soil in such a manner that it shall be no longer capable of producing it. If all malarial soils were alike, we might be certain, or nearly certain, that we could make them healthy by a system of culture and drainage which has evidently succeeded in some instances.

"Unfortunately, malaria may be produced in the most diverse soils, and that which perfectly succeeds in abolishing it in one place may have little or no effect in another.

"Plantations of eucalyptus appear to have had a good effect in some cases, yet Professor Liviesedge, of the University of Sydney, states that he has seen malaria very prevalent in a eucalyptus forest. As yet we are working blindly; sometimes we obtain good results, sometimes it seems as if we made matters worse. We need careful study of the natural history of malaria, of the effects upon it of change of character or condition of soils, etc., etc."

These views of Professor Tommasi Crudeli are no doubt influenced by his idea of the persistence of the germ of the *bacillus malariæ;* and extensive experience in this country of the good results of drainage and culture would seem to leave little room for doubt as to the sanitary value of these measures, yet his propositions are so far true that no one familiar with the subject would be willing to guarantee to free a locality from malaria by such means, although he might strongly recommend them, and there can be no doubt that careful study of the subject is extremely desirable.

Just how and where this study is to be made does not appear as yet, but the interests involved are so great, and the education of the public in these subjects is progressing so rapidly, that it cannot be long before we shall see a systematic investigation of malaria by competent scientific men undertaken and carried out as it should be.

THE NATIONAL BOARD OF HEALTH.

We have seen with great regret during the last two months, a series of news items from Washington in the daily press, which indicated that the National Board of Health was struggling to obtain control of the special epidemic fund, of one hundred thousand dollars, placed by Congress at the disposal of the President for prevention of the spread of epidemic diseases. With regard to the attempts of friends of the Board to induce the President to commit the charge of this fund to the Board, we have only to say that we have not considered such attempts expedient, first, because the action urged upon the President was directly opposed to what everyone knows was the intent and purpose of the House of Represenatives in granting this appropriation, and second, because we were convinced that the attempts would not succeed.

Had the President been induced to turn this fund over to the Board, and had the Board used any part of it to pay their office or clerical expenses, for which no other appropriation has been made, we believe such action would have been wrong, contrary to the intent of Congress in making the appropriation, and extremely detrimental to the interests of a National Health Organization.

Digitized by Google

The President has, however, placed the expenditure of this fund under the direction of the Secretary of the Treasury, who has written a letter to the Surgeon-General of the Marine Hospital Service, of which the following is a copy:

"The President has directed the Secretary of the Treasury to take charge of the expenditure of the appropriation in the sundry civil appropriation act of March 3, 1883, for the prevention of the spread of epidemic diseases. This Department has determined to commit to the Surgeon-General of the Marine Hospital Service the inquiry into the need of the use of the money, and the duty of applying it in cases that arise thereupon; and you are hereby authorized to make requisition from time to time for such sums as may be deemed necessary to carry into effect the purposes of said appropriation, to be expended in accordance with the existing regulations of the marine hospital service."

It seems to us that the only dignified and proper course for the members of the National Board to pursue is to at once resign their positions. This course is desirable not only for their own sakes, but in the interest of a national public health organization.

Personally we have the highest regard and respect for those members of the Board whom we happen to know, but they are not the only men in this country who are fit to be in such a position, and the President should be allowed the opportunity to try some new men, and see whether it is not possible to organize a Board which will command the confidence of Congress.

It is very clear to us that such a Board should not be composed wholly of physicians, no matter how learned they may be; the great business interests of the country should be represented on it.

During the next Congress we must have some legislation with regard to our National Health Organization, and with the experience gained, we believe it will be possible to put such an organization on a permanent and satisfactory basis.

The present plan has proved a failure, for reasons which we pointed out last fall, but the friends of the National Board and of National Sanitary Work have no reason to be discouraged.

Let the present members of the Board resign, in order that no one can discredit their advice by charging them with a desire to hold office, or carrying out a sort of a dog-in-the-manger policy, by refusing to let any others have an opportunity of seeing whether they cannot secure better results; and having resigned, let them then give the country the benefit of their experience, and advice as to what legislation is necessary to properly organize the Board, and to enable it to do good work.

We are glad to see that the Boston *Herald* is calling attention to the mischievous bill that recently passed the lower house of the Massachusetts Legislature, which should be entitled "A Bill to Protect the Adulterators of Food." In our issue of May 10, we called attention to some of its bad features. The friends of an honest anti-food adulteration law should see that this measure is defeated. In our opinion it was dishonestly conceived, is dishonestly pushed, and would encourage dishonesty if a law. If the Legislature will grant the necessary appropriations for its enforcement, the present law is ample to afford protection to both the consumer and the honest dealer.

One of the humors of the "Tariff Debate" was the zeal with which certain members went for free trade, coupled with judicious protection for the products of their own sections. An equally amusing illustration of the same principle was given when the wells of Brooklyn were discussed by the Aldermen last week. It was evident that certain members, since our last report, had posted themselves up. They expressed strong sentiments on the danger of well pollution, but when it came to the particular wells in their particular wards a universal exception was made, and the Board at large must have been delighted to find that every well had its own defender, who might be presumed to know most about it. The whole question was finally disposed of by *leaving it to the alderman of each ward to decide on the quality of the wells in that ward.* Brooklyn is to be congratulated on the quality of pure well water, which will be discovered within her limits, and might reward the aldermen by gifts of it as something strange and new to them.

An elegant cottage has been built during the past winter at a favorite seaside resort, the water for which is to be taken from a well 30 feet deep, close to the house. Not 30 feet from the well, and close to the house, a cesspool was excavated 10 feet deep, the bottom left unpaved, and the walls laid up with brick, dry, and then arched over, with no ventilator. The contractor, a plumber, who knew better, on being remonstrated with by an outsider who saw the work, said that he had followed the architect's express instructions. Thinking over it, however, he took the liberty, on his own responsibility, of plastering the walls and bottom, leading a ventilating pipe to the roof and providing an overflow into a pipe leading to tide water. If the owner of that house had had his own and the architect's way, and had suffered from it, he would, doubtless, have deemed his affliction an "inscrutable dispensation of Providence."

LETTERS TO A YOUNG ARCHITECT ON VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U. S. A.

No. XLVI.

While the ventilation and heating of the Barnes' Hospital, as described in my last two letters, have proved very satisfactory, as is shown not only by continued and carefully applied tests, but also by the fact that while for the last four years this hospital has been constantly overcrowded in the sense that it has contained from 25 to 40 per cent. more patients than it was intended for, no evil results have thus far been produced, and the air in the hospital is, as shown by very recent examination, quite free from unpleasant odor; there are, nevertheless, some points in regard to which the arrangements for ventilation might be improved.

In the first place, there are no means by which the temperature of the fresh air issuing from any given register can be rapidly changed without interfering with the amount of air introduced. I say "rapidly changed," because the change can be effected by varying the amount of hot water allowed to circulate through the coil, by means of the valves placed in the supply pipe for each coil; but it requires nearly an hour for the coil to cool down to the extent that it is

PLAN OF CELLAR

NEW YORK HOSPITAL BUILDINGS

sometimes desirable should occur in five minutes. The means by which this rapid change can be effected will be described presently.

In the second place, the proportions of the air ducts, fan and chimneys are not quite such as to secure the best results obtainable with a given expenditure of force. The amount of air delivered at some registers is greater than that which comes from others, and the same is true as regards the foul air exhausts, so that in order to secure sufficient supply and exhaust at all points we must have more than is necessary at some points. It is very true that this excess is useful, and that as regards hospital ventilation, "nothing less than too much is enough."

A third objection is the position of the foul air registers in the floor along the centre of the ward. The tendency of patients to spit down these registers or to throw things into them is very great, and while no evil results have followed in a hospital which is under military discipline, and where the foul air boxes are cleaned every day, it is better to transfer these registers to a point beneath the beds, where they are out of the way and equally efficacious.

The placing of the kitchen in the third story of the hospital was a decided success in more ways than one. The odors from cooking are almost entirely excluded from the building, although sometimes the lift which passes from the kitchen down to the dining room acts as a sort of air pump, and draws or forces some of the air from the kitchen down to the second floor.

This principle of placing the kitchen on the upper floor was adopted in the new New York Hospital, the plans for which, prepared by the architect, Mr. Geo. B. Post, were adopted in 1875.

This hospital is located near the centre of New York City and is an illustration of an attempt to make up in height for deficiency in ground area.

The general arrangement is shown in the accompanying plans, which are copied from those prepared by the architect to illustrate his description of the building, which is of brick and contains 163 beds. In the wards there is one window to each bed, each external pier of the building being a flue which is lined with hollow bricks to prevent, as far as possible, loss of heat by radiation. Through the centre of these flues run cast iron pipes intended to be fitted so as to be air-tight, and through which fresh air is taken to the building, being forced in by a fan.

The spaces outside these fresh air pipes are the foul air flues. These terminate above in pipes leading to an exhaust fan, which is located in the top of the centre building.

The heating is by steam, the coils being arranged at the bottom of the fresh air pipes in such a way that by a valve the cool air from the propelling fan can be sent either through or around the heating coil. The fresh air is admitted to the wards through slits in the window sills, forming a jet directed upward on the principle of Tobin's tubes. A similar arrangement exists in the pavilion of the London Hospital, erected in 1875–6.

The openings for the exit of foul air from the wards, are in part placed in the walls of the piers, and in part beneath the beds.

No effort or cost was spared in the construction of this building, to overcome the difficulties connected with the arrangement of heating and ventilation of a building of so many stories, all of which through the staircase halls and elevator shafts, are practically in free communication with each other, and a fair amount of success has been attained. I do not know of any published observations showing what the actual operation of the apparatus is, but I have visited the hospital several times and have twice tested the currents with the anemometer. These testings made the average air supply to be about 2,400 cubic feet per bed per hour—an insufficient amount, if all the beds were full, which, however, was not the case.

The principle of placing fresh air pipes inside of the foul air ducts is one that cannot be approved of for hospital ventilation, for although the fresh air pipes are of iron—and may have been tightly fitted—it is a mere question of time when some communication will be established between the inner and outer surfaces of these pipes, either by rusting or by alternate expansions and contractions, and then the foul air may be carried back into the wards. The iron pipes are not readily accessible, inclosed as they are in the brick walls, and there is no ready means of determining their condition. On one occasion, when I visited the hospital, the fumes of burning sulphur, which was being used to disinfect a room at some little distance, entered the room in which I was. Precisely how this was effected could not then be ascertained, but it indicated that the system was not working satisfactorily.

The principle of having two fans, one for propulsion and the other for exhaust, is not peculiar to this hospital; it was tried for several years

Digitized by Google

in the hall of the House of Representative at Washington, but the results were not satisfactory, and the plan is not one to be recommended. A single powerful exhaust is the system best calculated to overcome the peculiar difficulties met with in attempting to secure a satisfactory distribution of air in a lofty hospital of many stories.

But while the resources of modern engineering are no doubt competent to secure satisfactory ventilation in a hospital ten stories high, if necessary, they can only do this at a comparatively great cost, and it is therefore now generally admitted that it is best to put hospitals where they can have plenty of room and fresh air without being compelled to go upward for them.

THE PROMOTION OF ORIGINAL RESEARCH IN SANITARY SCIENCE.

We note with great satisfaction the scheme proposed by the Grocers' Company of the city of London for encouraging original research in sanitary science. This scheme, as reported in the *British Medical Journal*, is as follows:

"It consists of two forms of endowment: the one, meant as maintenance for work in progress, in fields of research to be chosen by the worker himself; the other, meant as a reward for actual discovery, in fields of research to be specified from time to time by the Company. With the former intention, the Company establishes three Research Scholarships, each of £250 a year; with the latter intention, they appoint a Discovery Prize of £1,000, to be given once in every four years.

"*Research Scholarships.*—The Research Scholarships are intended as stipends for persons engaged in making exact researches into the causes of important diseases, and into the means by which the respective causes may be prevented or obviated. The Court of the Company propose to appoint to two of the scholarships in May, 1883, and to a third in May, 1884, after which the vacancies which occur will be filled in each succeeding May. Subject to the conditions of tenure, each appointment will be for one year, and the holder will be eligible for reappointment.

"*Candidature for Scholarships.*—Applications for appointments to scholarships must be made during the month of April in each year, by letter addressed to the Clerk of the Grocers' Company, Grocers' Hall, London, E. C. Candidates must be British subjects, and, when competing for a first appointment, must be under the age of thirty-five. Each candidate, in his application, must make an exact statement of the research or researches which he proposes to undertake, and must declare that, if appointed, he will conform to the conditions under which the scholarships are held. His application must be accompanied by first class testimonials; both general, as to his personal and scientific character, and special, as to his qualifications for the research or researches which he proposes to undertake; and he may, if he pleases, also adduce, in support of his application, the evidence of any work which he has in progress, or has already published, in the same, or in any kindred field of study. Candidates may be required to wait upon the Court, or upon the Scientific Committee appointed by the Court, at some time in the month of May. * * * The general intention will be, that, as between candidates whose evidence, of character and qualification are considered adequate, preference shall be given to the candidate whose application proposes the more important research; and that researches shall be considered important in proportion as they are judged likely to throw new light on the causation or preventability of some important disease or diseases.

"*Quadrennial Discovery Prize.*—The quadrennial discovery prize is intended to reward original investigations which shall have resulted in important additions to exact knowledge in particular (previously defined) sections of sanitary subject-matter. The Court will, once in four years, propose some subject for investigation, and a period of at least three and a half years will on each occasion be allowed for the investigation of the subject that has been proposed. In determining, on each occasion, what particular subject shall be proposed for the prize, careful regard will be had to all the scientific circumstances of the time, both as to the urgency of existing needs for particular kinds of knowledge, and as to the expectations which may reasonably be held that discovery in the needed kinds of knowledge can be made within the allowed period.

"The subject for the first discovery prize will be announced in May, 1883, and the period for investigation will extend to the last day of December, 1886. The Court will announce the award in May, 1887, when also (as at present advised) they will propose a further subject for investigation. The general conditions of candidature and award will be as below stated, but with liability to amendment from time to time; and on each occasion when a subject for the discovery prize is announced, special conditions referring to the particular subject may also have to be laid down. All the conditions which at any particular time shall be in force will be obtainable from the Clerk of the Company.

"*Candidature for Discovery Prize.*—The discovery prize will be open to universal competition—British and foreign. The period allowed for the competition will begin with the day of announcement of the subject for investigation, and will end with the last day of the fourth following December. Any person who desires to be regarded as a candidate for the prize must deliver or cause to be delivered at the hall of the Company, within the allowed period, a letter in which he declares himself to be a candidate for the prize, and the treatise on which he bases his candidature; such letter, and such treatise, to be addressed to the Clerk of the Company, who will give a dated receipt for the same. The competition treatise of a candidate may, if the candidate so prefer, be delivered in successive parts, each bearing its proper date. Each treatise in competition for the discovery prize must be an original work by the candidate who sends it in. It may be a treatise which he has published at any time within the allowed period, or may be a treatise which he has not previously published. Although candidature is not restricted to any one nationality, all treatises and all communications with the Company in relation to them must be in the English language. Translations into English of competition treatises published (within the allowed period) in a foreign language will be received on a like footing with treatises originally in English. All treatises must be in print. Each treatise must bear the name of its author. Any particular candidate may be required to demonstrate practically to the Court or the Scientific Committee any fact or result which he claims to have discovered. Candidature will be held to imply that the candidate undertakes to accept as regards himself the award which the Court shall make."

This is going to work in the right way, and we sincerely hope that the example thus set will be followed in this country.

PLAN OF SECOND, THIRD, AND FOURTH STORIES

NEW YORK HOSPITAL BUILDINGS

HEALTH MATTERS IN TENNESSEE.

Dr. C. C. Fite, the Secretary and Executive Officer of the State Board of Health of Tennessee, has presented to that body an interesting report for the quarter ending March 31, from which we take the following notes:

The greater part of the work of the Board during this period has been connected with small-pox, which has appeared at various places in the State. Dr. P. D. Sims, of Chattanooga, reports the total number of cases in that city from Jan. 7, 1882, to April 1, 1883, to be 685; number of deaths 335; a very heavy mortality.

Dr. Richard Cheatham, of Nashville, reports the number of cases in that city from Jan. 1, 1883, to March 31, 1883, to be 151; 103 of which were in the colored population:

"Knoxville had a good deal of trouble for a while—in December and January—but early in January the City Board of Health induced the City Council to appoint nine vaccinators, who did their work well, and the disease was soon under control. Up to Feb. 5 they had thirty-one cases, not including the cases developed previous to January 1.

"Dr. A. McNabb, President of the Cleveland Board of Health, reported, Jan. 26, that there were ten cases; by Feb. 13 three more cases had developed. No report from that point since the above date.

"Dr. S. P. Hood had charge of the cases at Mossy Creek, and displayed an unusual amount of executive capacity in the way he managed it. Up to Feb. 27 he reported forty-eight cases. Of eighty exposed persons, only four had ever been vaccinated. By prompt isolation and vaccination, the disease was controlled successfully.

"Early in February a case was developed near Gainesboro, Jackson County. The county authorities had a great deal of trouble in preventing the neighbors from visiting the case, but by prompt and vigorous measures the disease was limited to six cases, and the entire county is now well vaccinated.

"The cases at Johnsonville created a great deal of alarm up and down the Tennessee River, and on the line of the railroads the demand for quarantine was general and vigorous, but the safer plan of vaccination was finally adopted, and a large scope of country that has had no vaccination since the war is now well protected. At Nixon, a boat-hand who had helped carry a case at Johnsonville, was the cause of no little alarm, but as the local board was ready to take charge of it, there was no new cases. Jan. 4 a case was developed at La Guardo, Wilson County. Dr. W. W. Prater reported five other cases developed from that one in the same household.

"Nearly every other town in the State has asked for permission to quarantine against the infected points, but the advice has always been—Small-pox is a continuous epidemic, and an absolute quarantine almost impracticable, differing from the limited summer epidemics.

"The danger on the rivers is from steamers; they ship hands without ascertaining whether or not they are vaccinated, and if they take sick they are put off without regard to consequences.

"If vaccination was a new and untried preventative against the small-pox, the experience of this office, in the past three months, would establish its value beyond controversy. If we were to enumerate the points at which it was exemplified, it would take page after page to give the plain facts. Vaccination, genuine, complete and exhaustive, will put out an epidemic of small-pox as certainly as a bucket of water will a lighted torch. Wherever vaccination has been neglected, or carelessly or superficially done, the battle against the loathsome disease has been long and tedious. Quarantine is, of course, a necessity, as vaccination is so much neglected and avoided. But this office has certainly taught the doctrine to quarantine the diseased, but vaccinate, vaccinate, until everybody is protected."

WATER CLOSETS AND RADIATORS.

AN ILLUSTRATED CHRONOLOGICAL ACCOUNT OF ALL PATENTS WHICH HAVE EXPIRED AND ARE NOW PUBLIC PROPERTY.

BY F. B. BROCK, ESQ., WASHINGTON, D. C.

No. II.—RADIATORS.

January 25, 1848, Anthony E. Hitchings devised the heat-radiating apparatus shown by the accompanying cut, which is a vertical sectional view. The nature of the invention consists in providing a series of double concentric cylinders, connected alternately at top and bottom, and in communication with a boiler for supplying and circulating hot water to and through the apparatus and back again to the boiler. A ball cock is provided to guard against overheating, and to keep the water at its proper level.

A is the outside and *E* the inner concentric cylinders. The hot water from the boiler (not shown) passes up the pipe *f* into the first cylinder *A*, and between it and the cylinder *E*, round which it circulates. When it reaches the top of the cylinder it passes through pipe *c* to the second cylinder, down this and through the connecting pipe to the third, and then to the fourth, or through as many as may be used. From the last it is forced into the reservoir *G*, which is filled a few inches above the pipe *f*. The water here escapes down the return pipe *g*, through the air-box pedestal having opening *D*, back again to the boiler. *e* is an overflow pipe, *d* is a ball-cock allowing of the automatic communication through pipe *b* with the radiators and reservoir, should the water get low, thereby relieving any pressure which may be generated in the radiators under such circumstances.

In the construction patented by Adrian Janes, January 29, 1850, a number of horizontal pipes are arranged one above the other, connected by a header at each end, and form what the inventor terms a "gang." Several of these gangs are placed side by side, having suitable connections, and are called a "cluster." The whole is inclosed in a non-conducting chamber, into which external air is admitted, and from which it is drawn after being heated.

HITCHING'S RADIATOR.

WILSON'S RADIATOR.

C represents the series of headers, having sockets for the reception of the horizontal pipes. Any number of gangs thus formed, each independent in itself, is placed side by side to form a cluster or radiator of the desired magnitude.

The gangs are all connected at one of the vertical headers near the top by a "union box" *D*. At the opposite end of the radiator, at the bottom, is another box *D*. *A* represents the inlet pipe from a boiler *G*, and a return pipe *B* connects with the other union box *D* and leads back to the boiler, forming a complete circulation.

The elongated union boxes *D* have as many connecting pipes in communication with the headers as there are gangs in the cluster or radiator.

Nov. 4, 1851, Joshua K. Ingalls devised a steam radiator, for which he obtained letters patent.

The cut illustrates, in sectional view, his construction, the nature of which consists in giving a tapering form to the radiating surfaces. Ingalls states that by applying this principle to extremely narrow chambers and air spaces alternately repeated, he brings the air in contact with the whole extent of heating surface, and imparts a current to the heated air which, it is stated, it would not have without the tapering form. The radiator is made of sheet or cast metal, in the form of a system of concentric cylindrical chambers *a*, each being about an inch thick at the bottom, with a slight but gradual taper toward the top. The alternate spaces *b* are for the air, and are made to increase toward the top by the receding of the chambers. The several chambers are united by means of pipes *d*, so as to allow free circulation through them. The series of chambers *a* and air chambers *b* may be arranged in square form, if desired. The air is supplied at the bottom; as it enters the spaces *b* where they are narrowed, it is forced upward by the action of the heat. The expansion of the heated air causes the spaces *b* still to be filled, so that the air absorbs the maximum of heat, the heat becoming latent in the air in consequence of its expansion, and is re-supplied from the upper surfaces. Thus, it is said, a greater amount of heat is taken up and thrown out (by the current imparted) in consequence of the expansion and the tapered surfaces.

Tasker's improvement consisted of a method of putting together the radiator tubes for warming buildings either by hot water or steam.

A represents a single series of tubes of the radiator, composed of a number of tubes, *a*, joined together, and having free communication with each other by means of the tubes *G D*, and the end or terminal sections *E*. These sections are fitted to each other by the shoulder and flange joints *E F*, and made water-tight by the through bolt *H*, which passes through all the sections, the joints being provided with washers of vulcanized rubber.

The through bolt *H* being surrounded by hot water or steam, expands immediately on the first application of heat, thus preventing, it is said, the breaking of the bolts, or the forcible stripping of the screw-threads by the expansion of the tubes.

INGALL'S RADIATOR.

JANES' RADIATOR.

The novelty lies in the mode of securing the several systems of radiator tubes by the employment of four terminal sections, *E*, to each system, the whole being made water-tight by the through bolts *H*. The date of this device is March 9, 1858.

Wilson's apparatus (patented July 26, 1859) comprises a radiator consisting of long, narrow boxes or tubes of cast iron, of a corrugated form transversely. Through bolts are used, whereby the boxes can be built upon one another so as to form a connecting series of chambers of any desired height, and allow of unequal expansion under the action of the heating media.

In the accompanying cut, 1, 2, 3, etc., are tubes or boxes of cast iron, having transverse corrugations *F*, in order that they may expand with the through bolts *D*, or yield to their contraction. Each box has in its lower side two circular apertures, *A*, to receive corresponding but slightly smaller nozzles, *B*, which project from the upper side of all the sections.

The through bolts, *D*, traverse the series of boxes from top to bottom, and are secured below the bottom box by nuts *d*, and serve to hold the radiator firmly together. *G* are pipes for the entrance and escape of steam.

Increased capacity is had by adding to the height of the radiator without increasing the floor space, bolts *D* of suitable length therefor being required. A sheet iron cap covers the top of the apparatus.

[TO BE CONTINUED.]

NOTE.—In these articles it is proposed to alternate appliances used in connection with plumbing and steam heating. The odd numbered articles are on plumbing appliances, beginning with water closets, the even number on steam apparatus, as stated in the title. They will include all patents which are now free to be used by the public.

THE FARMER'S HOME.—The home should be favorably situated in respect to drainage; the region round about the house should be well drained, either naturally or artificially, so as to secure exemption from all diseases of malarial origin. The immediate site and surroundings of the home should be well drained, so as to secure a dry, warm, and wholesome atmosphere. A wet or damp situation is liable to produce colds, or even more serious lung affections. Good sewerage, to carry off the waste of the household, is still more important; if the sink drains and sewers of a house are imperfect, no matter how convenient or elegant the house may appear, it is not fit for anybody to live in.

Pure air, and plenty of it, is another essential of good health; little bed rooms, or even larger rooms without the means of securing a sufficient change of air, should not be tolerated. No fact in hygiene is better established than the tendency of confined air breathed over and over again, to favor the development of tubercle, or what is usually known as consumption. Hence it is, that a man's worst enemy is his own breath.—*Exchange.*

TASKER'S RADIATOR.

Correspondence.

URINAL FOOT DRAINS—A CORRECTION.

NEW YORK, *May* 24, 1883.

To the Editor of THE SANITARY ENGINEER:

In the description, published in your issue of this date, of the plumbing work done by me in a commercial building of this city, my ideas about foot drains for urinals are not correctly given. It is true that I believe them to be of greater harm than good—not because the trap is unsealed most o the time, but because it is not flushed out often enough, the contents being allowed to become stagnant, when they give off sickening odors. The underside of the strainer, too, becomes coated with offensive matter, which adds to the foul smells.

I would also call attention to the fact that by means of the method of ventilation employed in the above-mentioned job, the room containing the fixtures is ventilated, as well as those portions of the waste pipe between the traps and fixtures, air being constantly sucked in at every fixture outlet. Very respectfully,

EDWARD DUGGAN.

BOILERS AND MAINS.

BURLINGTON, VT., *May* 16, 1883.

To the Editor of THE SANITARY ENGINEER:

I don't know but that I am asking too much of the privileges you grant some of your subscribers. I am a comparatively new subscriber, but have been an interested reader for some time, so I know I could not go to better for answers to the questions I ask.

I have been called to look at a steam job in a neighboring town to discover why it does not work satisfactorily. You will see my sketch of it in which I have tried to give information enough to form an answer to my question. One party claims that the piping is too large and the boiler is large enough, and I claim that the piping is large enough but the boiler is too small. Which is right? The mains and branches are too small if estimated from Baldwin's Diagram.

By answering either in your paper or by mail you will greatly oblige A SUBSCRIBER.

[The No. 7 boiler you refer to is not too small, neither are the mains too large.

You do not tell us what the trouble is, but from the fact that you say in your memoranda "the job is perfectly noiseless at all pressures," we must assume the trouble, if any, to be that you cannot get the house sufficiently warm, in which case you must use large heaters, though according to general averages 900 square feet of surface should be enough for 42,692 cubic feet of air space.

Though the piping near the boiler is not as large as called for in Baldwin's Diagram, it may be sufficient for the difference of level between the water-line and the mains in this case, his diagram being based on ultimate conditions.]

LINING A TANK.

SPRINGFIELD, May 9, 1883.

To the Editor of THE SANITARY ENGINEER:

I write to you for information in regard to tank wiping. I understand my trade thoroughly with the exception of tank wiping, and feel as if I would like a little instruction on that point, and trust you will favor me with a reply. I have been a constant reader of THE SANITARY ENGINEER for the past year and like it very much. I have a copper tank to line—four feet high, seven feet long and four feet wide, seams up each corner and on the bottom; the tank is stationary. Yours in haste. H. C. H.

[How to line a tank with copper was explained on page 294 of the current volume. The question of lead lining was discussed on pages 559 and 583 of the fourth volume.]

A BOTCH OF A SPECIFICATION.

SALT LAKE CITY, UTAH, *May* 4, 1883.

To the Editor of THE SANITARY ENGINEER:

Inclosed you will find a copy of plumbing specifications shown me some days since, and under which plumbers here are asked to figure. In justice to the plumbers of Salt Lake City, I will say that there is some good work done here, but the majority of the work is done under specifications similar to the one inclosed, or under none at all. We have no city ordinance regulating such matters.

H.

SPECIFICATIONS TO GUIDE THE PLUMBER AND GAS FITTER IN THE WORK TO BE PERFORMED ON.....,

ALSO TINNERS' WORK TO BE DONE.

GAS PIPES ON FIRST FLOOR. The rooms on first floor to be provided with drop lights in the centre of ceilings. Kitchen, dining room and east chamber, or sitting room to have side lights as follows:—Kitchen one in partition, at the northwest corner of room. Dining room, one on the west wall, south of window. Sitting room to have one on *each* side of the chimney breast. Also parlor to have one on each side of chimney breast. Hall to have one drop light in ceiling in the centre, or as near as may not interfere with stairway.

GAS PIPES ON 2D FLOOR HALL AND IN OTHER ROOMS. Hall to have drop light in centre of the largest part. Other rooms to have drop lights in centres.

GENERAL REMARKS. The contractor to furnish all pipes, elbows, and T joints necessary to make a good, satisfactory job, and to place the pipes in the wall so they can be well covered with the plaster. Pipes to be best quality. All necessary excavation to be done by contractor. Work to be done as much as possible before the floors are laid. No fixtures included in contract.

WATER SUPPLY. All necessary excavations to be done by contractor deep enough to insure against frost, and in such place as to be least liable to freeze and gain the desired point of supply.

KITCHEN BOILER. Place and supply range boiler with proper pipes and connections to supply sink and wash bowl in northwest corner of kitchen,

BATH ROOM, ETC. as per plans; also furnish pipes to bath and wash bowl on second floor.

SINKS, 1ST FLOOR. Sink to be lined with zinc and have beneath, with lead pipe of proper diameter to carry off waste; also supply of warm and cold water brass cocks. Wash bowl supplied with warm and cold water brass cocks, waste Y trap; also furnish wash bowl in chamber on first floor on north side with necessary supply and waste. Marble top and top with back piece. Nickel trimmings.

2D FLOOR. Furnish tinned bath tub, 5 feet 6 inches long, and supply it with all necessary and nickel plated trimmings; also furnish marble wash basin in bath room with trimming, etc., to be placed as shown on plan.

HALL. Hall to have basin in corner as shown on plan, with supply, waste. Trimmings same as before mentioned.

REMARKS. The owner will furnish range, but the contractor must place the same where directed and furnish all other necessary appurtenances for hot and cold water supply and waste. Dig cesspool and lead waste pipes into it.

WATER CLOSET. Water closet furnished in bath room with all necessary appurtenances as selected by owner. The whole to be done in a good, substantial, workmanlike manner, and no advantage taken of any omission or discrepancy that may appear in this specification as this is intended to show the general idea of arrangement. All work to be tested and made satisfactory to owner.

Porch and bay window to be covered with good tin, flashed around posts and against the wall. The exposed door and window caps to be covered with tin and flashed against wall.

The owner reserves the right to reject any or all bids.

[It is creditable to the plumbers of your city that citizens get any good work done, especially if this memoranda is a fair specimen of the so-called specifications estimates are made on. If this owner paid to have a plumbing specification drawn, he has received nothing for his money; if he was unwilling to do so, and relies on this to secure a good job, it will be a wonder if he does not get fooled.]

PLANE OR PLAIN.

SPRINGFIELD, *May* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you settle the orthography of the term *plain* or *plane* surface, as applied to the outside surface of radiators?

In nearly all catalogues and other trade books it is spelled *plain*, but when used by writers it is generally *plane*. Why this difference?

An answer through your paper will settle a dispute, and may be of some importance to your readers.

Respectfully yours, STEAM FITTER.

[The difference evidently comes from the view taken of what plain or plane surface is.

The trade was long accustomed to a certain kind of heaters or coils made of pipe or castings, which was smooth, or nearly so, on the outside; but then the innovation came, and surfaces were put on the market which had projections on the outside surface, but too small to be "coredout" in the projection, and they were called "extended surfaces." Then the manufacturers of old styles of heating surface found it necessary to call their surface *plain*, to indicate it was ordinary or common.

But soon again surface was made and put on the market, which was not ordinary or common, as it was corrugated or extended in such a manner that the inside or coring of the casting followed the contour of the outside of the radiator, and which could not be said to be "extended surface" in the first acceptation of the word; nor was it the old kind, which had been called plain for the sake of distinction; but, nevertheless, it had the *distinction* which the advocates of the old school claimed as a point in favor of the pipe method—namely—that the inside or steam surface was the same, or nearly the same, as the outside surface, but as it was not *plain* it was called *plane*, to distinguish it from hilly or uneven surface.

Thus, pipe may be called *plain* or *plane* surface, while irregular shaped surface may be either *plane* or *extended*, according to how the coring is done; but if the coring does not follow the shape of the outside it is *extended*, therefore, all that is not extended may be called *plane*.]

BOILER CIRCULATION.

KANSAS CITY, MO., *May* 10, 1883.

To the Editor of THE SANITARY ENGINEER:

In the last few numbers of your paper, I have noticed some sketches on hot water circulation, the last being by J. T. Armstrong, Keene, N. H. My experience with a

Digitized by Google

job of that kind, would lead me to believe, that the only time he would get hot water at any point from boiler would be when the fire made steam enough to force water through hot water pipes to tank, he then might obtain hot water at furthest point.

In this city where the hydrant water is not very good, cistern water is used very much, and as rains do not come when wanted, the water is used carefully.

Inclosed find sketch of a job I did, when it was necessary to have hot water circulate below boiler, also draw hot water at fixtures below. Most of the fixtures are on ground floor; it is 65 feet from boiler to furthest fixture. The sketch only shows hot water pipe; an expansion pipe is taken off at highest point to tank. I only use one pipe as hot water and circulating pipe, and there are no check valves to interrupt circulation.

The small sketch shows what I believe to be a new contrivance for forcing a circulation, at least, I have never heard of one before. *A A* 1-inch copper from boiler to stove. *B B* 2 inch jacket around same, water from hot water pipe passes through *B*, and is heated by hot water passing through *A* from water back to boiler. Circulation is started as soon as fire is kindled. If there is any hot water in boiler it can be drawn at once. It does not matter how the water runs from boiler, as it must come out of top of boiler. Do you know of any better way of circulating and drawing hot water below boiler? Yours truly,

JOHN A. RONEY.

[We have no reason to suppose that J. T. Armstrong does not get warm water at all the warm water faucets in a reasonable time after the fire is started or that the supply is not continuous.

The experiences of others also go to prove that dipping all the pipes below the kitchen floor can be made practicable under certain conditions.

The condition required is, the sum of the weights of the water in the ascending columns must not be less than in the descending. The covering of all the ascending pipes with a good non-condnctor, and the exposure of all the descending pipes will assist the circulation.

Your arrangement of jacketing the pipe from the waterback to the boiler, we think will allow a person at a basin to get a certain quantity of water (warm) by drawing slowly in a much shorter time after the fire is started, but should a considerable quantity of water be required, then the draught will come on the boiler delivering water no hotter than in any ordinary case. But aside from that, we think it will quicken the circulation only in proportion as it prevents loss of heat to the air in an ascending pipe; but the question then arises may not the return water which is naturally colder than the outgoing counteract or more than counteract the gain from excluding the air from the pipe?]

THE HYGIENIC EXHIBITION AT BERLIN.

The Hygienic Exhibition was formally opened May 12, by the Crown Prince, Frederick William. A large number of State and city officials and many deputations were present at the ceremony. The Crown Prince expressed the thanks of the Emperor to the exhibition committee and to its promoters generally, and extended a hearty welcome to the foreign commissioners. He hoped that the exhibition would prove a success, as its object is to benefit humanity of all nations. The remarks of the Crown Prince were greeted with great enthusiasm. The building has just been completed and is erected on a scale far superior to the one which was burned down last year. It displays a large collection of articles for the preservation.

AMERICAN PRACTICE IN WARMING BUILDINGS BY STEAM.*

BY THE LATE ROBERT BRIGGS, M. INST. C.E.

(Continued from page 582.)

Radiators for diffusing heat.—In respect to the radiating surfaces for the diffusion of the heat, there are three distinct classes of warming apparatus in use in America, according to the object to be effected.

First, there is the apparatus for warming the rooms by so-called direct radiation; that is, by means of radiating surfaces exposed in the rooms themselves.

Secondly, there is the apparatus for what is sometimes called indirect warming, by means of currents of air; the heated surfaces are placed in a chamber, through which a limited supply of air is allowed to pass on its way into the room. In neither of these two methods is the warming accompanied by any systematic ventilation.

Thirdly, there is the apparatus for both warming and ventilating, arranged so that the warming shall take effect upon the whole supply of air admitted for ventilation.

The first and second methods are, withr are exceptions, employed for all dwellings, offices, and mills; the third is reserved for hospitals, asylums, public buildings, and the like. On the first and second plans the warming apparatus is required to be capable of maintaining a comfortable warmth in the very coldest weather, when the outdoor

temperature ranges as low as 15° below zero Fahrenheit; whence it is argued in favor of these two methods that in moderately cold weather their warming capacity will be so largely in excess as to admit of ample ventilation by opening windows or doors at pleasure. There are some who condemn altogether the first method or direct radiation, and strongly recommend the second or indirect, on the ground of the supply of fresh air secured by the warming currents in the latter method. But, as a rule, this supply of fresh air is inadequate; and with the prevalent construction of apparatus, the temperature of the warming currents on issuing from the heating chambers is too high, and cannot be controlled; and the regulation of the warmth in the room has to be effected by opening wider or partially closing the hot-air inlet from the heating chamber into the room, thereby altering the admission of fresh air. On the score of ventilation, the second method is perhaps preferable to the first, because for any temperature of the external air the second method does certainly supply some admission of fresh air, however varying and inadequate. But in the estimation of the community at large, the first method—direct radiation from surfaces exposed in the room itself—offers the pre-eminent advantage that the warming of a room is effected with great certainty and rapidity, and is under the immediate control of the occupant. Direct radiation has also the merit of requiring the smallest consumption of fuel; and although the cost of the apparatus is increased by the superior finish required for the radiators, which are here exposed to view, and by the greater length and complication of the mains, in comparison with the indirect method, yet the increase is about counterbalanced by the saving in extent of radiating surface and in diameter of mains with the direct system; and the special constructions of heating chambers, flues, and dampers, attending the indirect system, make the latter the more costly mode of warming any building.

The conditions of American ventilation and warming, in relation to health and comfort, differ materially from those prevailing for the same latitudes in Great Britain and other western parts of Europe. The temperature agreeable to Americans in cold weather* is about 70° Fahrenheit on the Atlantic coast, rising to 80° or 85° for inland localities and for the severest and driest cold. The American and European requirements differ therefore so completely, that in the tables given in the appendix no attempt has been made to establish any relation between the area of radiating surface in the warming apparatus and the extent of building to be warmed, whether as regards floor area, outside surface of walls or roof, and cubic capacity, or in connection with ventilation for varying numbers of persons or of lights; the tables are presumed to be equally applicable to data derived from experience on either side of the Atlantic.

In the buildings warmed in America by direct radiation there is generally no provision whatever of air-flues, either inlet or outlet, to aid ventilation. This is true for dwelling rooms, offices, and mill or factory rooms. Recently in many of the better living-rooms, and in offices also, open fire-places have been built, mainly for show, but possessing some utility in producing a little radiating heat for speedy warming. Fire-places, while valuable for ventilation, are chiefly important from the advantages they offer for the attainment of an equable temperature throughout a room. The outlet aperture in any room must be at or near the floor, at any rate in cold weather, so as to remove the air from the bottom of the room where it is coolest. Although the fouler air is of course at the top of every warm room, yet the discomfort consequent upon removing the warmer air from the top, and allowing the cooler air to stagnate below, is found too serious to be endured. A healthy atmosphere would indeed be maintained throughout the room, provided that, in removing air enough from the top, care were taken to supply an equal quantity of fresh air by a diffused admission suitably arranged for comfort; but complete ventilation will always fail to receive due consideration wherever it clashes with comfortable warmth. Gas lights are used, to the exclusion of all others, in American dwellings; and no inconvenience or unhealthiness is considered to result from the unventilated burners. It is fully recognized that the vitiation of air by the combustion of gas is not organic; and although, when the products of combustion are in excess, the air becomes unbreathable, it is by no means the source of disease.

In warming a room by direct radiation, the proper situation of the radiating surface for the attainment of an equable temperature is in some respects a moot question. As long ago as 1846 Dr. Morrell Wyman † called attention to the way in which heat was distributed in any room, when the source of heat was situated as usual at the back of the room, against an inner wall, with windows and exposed outside wall at the front or side of the room; and he showed that a layer of highly heated air collected next the ceiling

*A paper read before the Institution of Civil Engineers, November 28, 1882.

* This branch of the question was touched upon by the author in a paper read before the American Institute of Architects at their Boston meeting in October, 1877, and reprinted in January, 1878, in the "Quarterly Journal of Science."

† Dr. Wyman published in Boston, in 1846, "A practical treatise on Ventilation and Warming," containing much of novelty at the time and of lasting excellence. The work, now out of print, is as suggestive as Walker's "Hints on Ventilation," with which it may be compared.

Digitized by Google

whence descended a sheet of air along the cooler wall and window surfaces, becoming itself cooled in its descent, until at about the height of a man, a uniform temperature of comfortable warmth was established throughout the room. It is in conformity with this principal that, in the practice of warming in America by means of a hot-air furnace, the hot-air flues from the furnace are generally led up inside an inner wall, remote from windows or outside walls, and a tolerably equable and comfortable warmth is obtained by admitting into the room a limited quantity of very hot air, sometimes nearly as hot as 400° at the inlet. A closed stove, situated likewise against an inner wall, proves similarly effective; but with an open fire the draught of cold air, which from some source or other takes its course along the floor to the fire-place, seriously impairs the desirable uniformity of temperature in a room.

In warming by steam with direct radiating surfaces, the practice for many years was to arrange the steam pipes in lines or groups, called coils, along the bottom of the outside walls or under the windows. But present usage seems to indicate that better results can be obtained by placing the radiating surface where it will apparently be warming what is already the hottest part of the room; in reality it then promotes the natural circulation, whereby the proper diffusion of the warmth is aided, instead of being retarded. For warming rooms in mills, the most recent practice is to place the direct radiating pipes in rows overhead, suspended a foot or two from the ceiling, and two or three feet from the outside walls. Although by this arrangement the heat would apparently be expended in the top of the room, yet very satisfactory results are thereby obtained, in regard both to equability of warming and to efficiency of radiating surface.

In rooms warmed by direct radiation, the attempt has repeatedly been made to effect the ventilation by admitting air direct upon the radiating surfaces which are then placed under the windows, so as to intercept any descending currents of cooled air. Not much success has attended this plan, inasmuch as through some of the inlet apertures outward currents of warm air are then apt to escape from the room, producing no perceptible warming of the external air; while through others a flood of cold air enters from the outside, and, passing only some one coil or radiator, gets hardly warmed at all, the effect being far from comfortable.

[To be Continued.]

In a few days the Secretary of the Interior will promulgate a series of regulations to govern the importation of sugar.

On May 18 a bill passed the Michigan Legislature to amend an act to establish a State Board of Health and to provide for the appointment of a superintendent of vital statistics, and to assign certain duties to local boards of health.

Small-pox is developing to an alarming extent in Jacksonville, Ga. It is especially confined to negroes.

The London Sanitary Assurance Association, is going to recommend legislation which will compel builders of new dwellings to obtain a certificate from some authority as to their sanitary condition before such buildings can be inhabited.

Nothing has been definitely settled yet by the local steamboat inspectors as to what they will do with regard to the present method of storing gas, used in illuminating ferry-boats. Engineers of the ferry-boat companies are drawing plans which will be submitted to them in the course of a week. Action will then be taken upon them by the inspectors.

Louisville, Ky., has been selected for the tenth annual meeting of the National Conference of Charities and Corrections, which begins the 24th of September next. This year charity organization in cities, which as our readers know has been of the subjects to which most attention has been directed in this city, under the lead of Mrs. J. R. Lowell, and other earnest women and men, will be a special subject of discussion. Charitable penal and reform institutions are invited to have representations at this conference.

Food and Drugs.

ADULTERATED TEA.

The recent action of the State Board of Health in stopping a sale of "faced" teas has naturally led to the inqury whether this action indicates the future policy of the Board.

In other words, is the sale of faced teas to be looked upon as a violation of the Food and Drug Act, and as such prohibited?

The practice of adding a certain amount of coloring matter to the tea-leaf for the purpose of improving its appearance is so common, and of so long standing, that it is hardly to be wondered at that many should ask whether such a practice is to be prohibited.

The law distinctly states that an article of food is adulterated "if it be colored, or coated, or polished, or powdered, whereby damage is concealed, or it is made to appear better than it really is, or of greater value." There can be no doubt, therefore, that the practice of facing tea, or the sale of an article so treated, is a violation of the law, and any person violating the law is liable to prosecution.

The law, however, gives the Board of Health the power to declare certain articles exempt, and to establish standards. Some time ago the dealers in coffee and in mustard applied to the Board for permission to sell mixtures of these articles. The Board thereupon declared certain mixtures of coffee and of mustard to be exempt from the provisions of the law, and established certain conditions to be observed in the sale of these articles.

If tea importers and dealers wish a like privilege they should apply to the Board without delay. It would seem reasonable that the Board will not make any exemption until the tea merchants have applied for one.

If there are any good reasons why faced teas should be sold, or if there is any practicable way of determining what in the way of facing is allowable, and what may be prohibited, it should be made known. Tea merchants, therefore, if they desire that exemptions be made by the State Board of Health, will do well to get together and agree upon what they consider a proper standard. The Board will, do doubt, be glad to confer with them, and after due investigation accede to any demand that it considers just, proper and for the public interest. Meanwhile, under the laws of this State, the sale of all faced teas is illegal.

Two hundred and seventy packages of teas, intended for shipment to the coal districts of Pennsylvania, were seized in this city last week by Inspector Davies. The teas, know as *Chulan Ponchong*, were found to be adulterated with chulan berry. The importers made no contest, but shipped the whole lot back to London.

On May 26 another seizure of tea was made in New York under the act of March 2. The lot comprises 245 half chests of tea dust, styled fannings and siftings, of all colors and grades. Mr. J. R. Davies, the inspector, states that the Collector is now awaiting the decision of the importer, whether he will appeal from the assistant appraiser's decision, or whether he will export the teas without delay.

TEA ANALYSIS.

The following is the result of analysis of 418 pecks of Indian Teas, sold in this city May 25.

Extract	39,625
Total ash	5,427
Ash soluble in water	3,244
Ash insoluble in water	2,183
Ash insoluble in acid	0,137
Insoluble leaf	57,886
Tannic acid	18,868
Theine	3,140

No coloring and facing matters, nor foreign leaves or exhausted leaves were found.

THE PARIS LABORATORY FOR DETECTION OF ADULTERATION.

The following sketch of the operations of the Paris Municipal Laboratory is taken from the *Medical Press and Circular:*

This institution was established in 1881, and in it all qualitative analyses are made gratis, the reports being given in the following words: "Good, passable, bad (not injurious), bad (injurious)" A tradesman, whose place of business is pointed out as one in which adulterated articles are sold, is visited by two officers (inspectors).

They request to be allowed to examine the products on sale, and do so, both microscopically and chemically, on the spot, with the means they carry with them. If articles appear to be adulterated, two samples, one for examination at the laboratory, the other to be preserved in case of dispute, are taken and attested by the signatures of the tradesman and both officers.

Suspected samples can be lodged at the nearest bureau of police, by means of the prison van. Every article that enters the laboratory is analyzed quantitatively, the results, however, being only made known to the sender on payment of a fee, varying according to the nature of the substance, from five to thirty francs.

It is upon the figures obtained in this analysis the chief of the laboratory bases his opinion.

Each analysis is registered in a book for the purpose which remains at the laboratory and forms part of an important collection.

Photographic apparatus have been provided, affording the analysts the advantage of putting before the eyes of the jury and judges a palpable proof of the fraudulent adulteration, for instance in pepper, flour and confectionery, or showing them the presence of trichini, cysticerci, etc.

The cost of the laboratory amounts to [illegible] $25,000 thus divided:—

1 Director of the Laboratory	[illegible]
1 Sub-Director of the Laboratory	[illegible]
1 Analyst (1st class)	[illegible]
3 Analysts (2d class), £72 each	[illegible]
16 Inspectors (1st class), £105 each	[illegible]
16 Inspectors (2d class) £72 15s each	[illegible]
3 Employes, porters, " " "	[illegible]
General expenses,	[illegible]
Total	[illegible]

The rest of the sum is applied to the purchase of instruments, books, etc. Drugs are not liable to be analyzed at this laboratory. In France *Pharmaciens* can only be inspected by members of the School of Pharmacy, who alone have the right of entering into their *officines*. It is interesting to note the report for last year of M. Charles Girard, director of the establishment, as a sorry evidence of misplaced confidence in what the public swallow. In butter alone there were only eleven samples pure out of sixty-two examined. Preserved vegetables, on examination, showed the presence of copper in eleven out of thirty-five samples. Milk showed oat meal, white of egg, dextrine, sugar, brain matter, oils and fat. Wines showed oxide of lead, alum, salt salicylic acid, and sometimes arsenic in liquids colored with fuchsin. In the matter of wines, M. Charles Girard values the loss annually sustained by the treasury at more than £140,000.

Beer showed picric acid, gall, aloes, colocynth, cocculus indicus, cubeb mixed already for use, nux vomica and carbonate of soda, strychnine, bitter leaves, juniper, etc. The report even mentions, among various adulterating materials in different articles, rancid *fecula* manufactory. It is pleasant to find that the endeavors of the Laboratory have brought on a notable decrease in the number of adulterated articles sold in Paris and France generally.

The fruit dealers of New Orleans have made a proposition to the Board of Health, that if they are allowed to carry on the fruit trade between that city and Jamaica in the summer months, they will carry out the following rules:

First, that in trading the north side of the island shall alone be visited. Second, that they will send with each vessel a medical man to be chosen by the president of the Board of Health and paid by themselves. Third, that the purser of every vessel shall be acclimated to yellow fever. Fourth, that the doctor and purser alone shall first go ashore at each of the parts visited, on every trip, and if yellow fever be found to exist, the ships shall neither land nor receive cargo or passengers. Fifth, that the vessel shall be cleaned and disinfected in all cases before receiving cargo. Sixth, that the medical officer shall make and give to the quarantine physician of the complete absence of yellow fever from every port visited.

FLORIDA SHIP CANAL.

The Florida Ship Canal Company completed its organization May 9, and is ready for business. J. C. Brown, of Tennessee, is president, ex-Senator Windom, vice-president, George C. Gorham, secretary, S. T. Meyer, of the firm of Seligman & Co., of New York, treasurer, and Gen. Charles S. Stone, chief engineer. The Board of Directors comprises J. C. Brown, B. F. Butler, W. Windom, W. Mahone, Townsend Cox, of New York, Senator Jones, of Nevada, A. S. Mann, of Florida, Michael Jacobs, of New York, A. W. Jones, of Virginia, S. T. Meyer, Gov. W. E. Cameron and V. D. Grover. The capital stock is fixed at $60,000,000. About $10,000,000 has been divided among the incorporators and officials.—*Boston Herald.*

E. G. LOVE, Ph.D., *Gas Examiner.*

NEW YORK PLUMBING REGULATIONS.

The Board of Health of this city have now issued an improved edition of the rules and regulations governing plumbing, which incorporates changes already in the specifications issued by the Board, or which have been suggested by two years' experience of the inspectors and engineers of the Health Department. It will be observed that the changes make the regulations more clear and explicit, and in some cases now require what was before only recommended. Several important paragraphs have also been added. The practice of the Board in regard to stoneware pipe, expressed in their ruling last June, and found in the specifications, is now also incorporated into the rules and regulations; the weight of lead pipe is now defined; express provision is made for enlargement of trap vent pipes in high buildings; cisterns for water closets must be so fitted and adjusted as to prevent waste of water; the material of rain leaders, when inside the house, is fixed, and the grade of the house drain within both least and greatest limits of descent is determined. We give below a summary of these and other changes, and quote in full the new paragraphs:

Hereafter—"The drain, soil, and waste pipes, and the traps *must*, if practicable, be exposed to view for ready inspection at all times, and for convenience in repairing. When *necessarily* placed within partitions or in recesses of walls, soil and waste pipes *must* be covered with woodwork so fastened with screws as to be readily removed. In no case *shall* they be absolutely inaccessible."

"Shafts not less than three square feet in area are required in tenement houses, to ventilate interior water closets."

Iron pipe for house connections with the street sewer are now required only in "made" or "filled in" ground.

"Where the soil consists of a natural bed of loam, sand, or rock, the house-sewer may be of hard, salt-glazed and cylindrical earthenware pipe, laid on a smooth bottom, free from all projections of rock, and with the soil well rammed to prevent any settling of the pipe. Each section must be wetted before applying the cement, and the space between each hub and the small end of the next section must be completely and uniformly filled with the best hydraulic cement. Care must be taken to prevent any cement being forced into the drain to become an obstruction. No tempered-up cement shall be used. A straight edge must be used inside the pipe, and the different sections must be laid in perfect line on the bottom and sides. * * * Any house-drain or house-sewer put in and covered without due notice to the Health Department, must be uncovered for inspection at the direction of the Inspector."

A fresh air inlet of at least four inches in diameter is now required, "opening at or near the street curb or at a convenient place not less than four feet from the nearest window. No cold-air box for a furnace shall be so placed that it can by any possibility draw air from this inlet pipe. The inlet pipe should never be carried up to the roof inside or outside the house."

"No brick, sheet-metal, earthenware, or chimney flue shall be used as a sewer-ventilator, nor to ventilate any trap, drain, soil or waste pipe."

The extension above the roof of a soil or waste pipe receiving the discharge of fixtures on only one floor is not required.

"Soil, waste and vent pipes in an extension must be extended above the roof of the main building when otherwise they would open within twenty feet of the windows of the main house or the adjoining house."

"The minimum diameter of soil pipe permitted is four inches. A vertical waste pipe, into which a line of kitchen sinks discharge, must be at least two inches in diameter with one and a half inch branches."

"Where lead pipe is used to connect fixtures with vertical soil or waste pipes or to connect traps with vertical vent pipes, it must not be lighter than D pipe."

The large buildings for which extra heavy soil pipe is recommended are now defined to be those over sixty-five feet in height above the curb.

In place of the recommendation that "iron pipes, before being connected with fixtures, should have openings stopped, and be filled with water and allowed to stand twenty-four hours for inspection," the following is substituted:

"When required by an inspector from the Board of Health, the plumbing must be tested with the peppermint or the water test, by the plumber in the presence of the inspector, and all defective joints made tight, and other openings made impermeable to gases. Defective pipe discovered must be removed and replaced by sound pipe."

The following exception is made to the rule that all fixtures must be separately trapped: "where a sink and wash tubs immediately adjoin each other, the waste pipe from the tubs may be connected with the inlet side of the sink trap; in such a case the tub waste pipe is not required to be separately trapped."

The following paragraphs are new or entirely rewritten:

"Traps must be placed as near the fixtures as practicable, and in no case shall a trap be more than two feet from the fixtures.

"In no case shall the waste from a bath tub or other fixture be connected with a water closet trap."

"Traps must be protected from syphonage, and the waste pipe leading from them ventilated, by a special air pipe, in no case less than two inches in diameter, for water closet traps, and one inch and a half for other traps. Except in private dwellings, the vertical vent pipes for traps of water closets in buildings more than four stories in height must be at least three inches in diameter, with two-inch branches to each trap, and for traps of other fixtures not less than two inches in diameter, with branches one and a half inches in diameter, unless the trap is smaller, in which case the diameter of branch vent pipe must be at least equal to the diameter of the trap. In all cases vertical vent pipes must be of cast or wrought iron."

"Traps of fixtures near the fresh air inlet may be ventilated by being connected with it."

"No trap vent pipe shall be used as a waste or soil pipe."

"Overflow pipes from fixtures must, in each case, be connected on the inlet side of the trap."

"The sediment pipe from kitchen boilers must be connected on the inlet side of the sink trap."

"The valves of cisterns must be so fitted and adjusted as to prevent wasting of water, especially where cisterns are supplied from a tank on the roof."

"The overflow-pipes from water closet cisterns must discharge into an open sink or where its discharge will attract attention and indicate that waste of water is occurring, but not into the bowl of the water closet, not into the soil or waste pipe, nor into the drain or sewer. When the pressure of the Croton is not sufficient to supply these tanks a pump must be provided."

"When within the house the leader must be of cast-iron, with leaded joints; when outside of the house and connected with the house-drain it must be trapped beneath the ground or just inside of the wall, the trap being arranged in either case so as to prevent freezing. In every case where a leader opens near a window or a light shaft, it must be properly trapped at its base."

It is recommended that steam exhausts or flow-off pipes from steam boilers be discharged into a tank or condenser, "the waste from which, if to be discharged into the sewer through the house-drain, must be connected on the sewer side of the running trap."

The recommendation that yard drains be effectively trapped has been made a rule, and the following added: "Front area drains must, where practicable, be connected with the house-drain inside of the running trap."

The recommendation that cellar and foundation walls be rendered impervious to dampness has also been changed to a command, with the limiting clause, "where possible."

The following rules are all new:

"No privy vault or school sink will be allowed in any cellar or basement; nor shall the general privy accommodation of a tenement or lodging house be allowed to be in the cellar or basement."

"School sinks must be of cast-iron, not more than two feet in depth, connected at the upper end with the Croton supply, and at the lower end with a drain leading to the street-sewer, and provided with an outlet at the lowest point, and on the bottom so as to admit of a complete discharge of the contents whenever the outlet is opened and the sink flushed with water."

"The sink must be set so that the flange will be at least two feet below the yard surface, to prevent freezing. It must be at least ten feet from any window or as near that distance as practicable."

"The waste pipe from a hydrant sink in the yard must be properly trapped, especially where it discharges into a school sink, a privy vault, or cesspool, or the house drain."

"Open light and air courts must be properly drained."

"When a privy vault or cesspool must necessarily be used, and the water supply of the premises is from a well, they must be at least fifty feet from the well, and the privy vault must be absolutely tight."

AN ACKNOWLEDGMENT.

On the map of the subsurface irrigation work at Brynmawr, published at page 555, issue of May 17, should have appeared the name of Col. Geo. E. Waring, Jr., as the engineer who designed the scheme. The map from which our illustration was re-drawn made no mention of Col. Waring's connection with the work, nor were we advised of the fact. We cheerfully make the acknowledgment, therefore, now that our attention has been called to the omission. Its appearance in the same issue with Mr. Philbrick's article on the same subjects was without the latter's knowledge, and simply because we thought it of interest. The flush tank was made to hold ten thousand gallons.

RHODE ISLAND MASTER PLUMBERS.

PROVIDENCE, *May* 14, 1883.

To the Editor of THE SANITARY ENGINEER:

The first annual meeting of the Association of Master Plumbers of the State of Rhode Island and vicinity, was held at the Mechanics' Exchange, this city, April 26, 1883, and the following officers were elected: Thomas Phillips, President; Patrick Tierney, first Vice-President (second and third Vice-Presidents not elected); James C. Conroy, Recording Secretary; E. F. Carey, Corresponding Secretary; Patrick O'Connor, Treasurer; John Tierney, Seg't-at-Arms. Auditing Committee: George R. Phillips, Daniel Holmes, Wm. B. Thompson. License Committee: Geo. R. Phillips, Patrick Tierney, James C. Conroy.

We are in hopes to send three delegates to the national convention in June.

Little Rhody is never behind. We keep the ball moving. We never stop. Our motto is, "Onward and Upward."

Very truly, E. F. CAREY,
Corresponding Sec'y, 379 High St.

BOSTON PLUMBERS.

The Boston plumbers have organized a Master Plumbers' Association for that city and vicinity, and will be represented at the approaching convention in this city. The officers of the association are as follows: President, James Tucker; First Vice President, Isaac Riley; Second Vice President, Wm. Trainer; Third Vice President, Thomas J. Tute; Treasurer, T. H. Capper; Recording Secretary, Henry W. Tombs; Corresponding Secretary, James F. Davlin; Financial Secretary, John W. Cosden.

EXPLOSION IN A CESSPOOL.

We are indebted to a correspondent for the information that a gentleman in Columbus, Ohio, recently dropped a lighted match down the ventilating pipe of his dead-well, in order to see whether the water was draining off properly. The result was a sharp explosion, which blew the filth out of his house trap and frightened him into at once ordering sewer connections to be made and the well to be filled up. The well was about 40 feet from the house, received only the slops from the kitchen sink and the cistern overflow, and had no connection with the sewer.

WATER WASTE PREVENTION IN CINCINNATI.

The Committee on Water Works of the Cincinnati Board of Public Works, in their recent report recommending the purchase by the city of a perpetual right to the use of the Bell waterphone, present a considerable amount of interesting statistics regarding the decrease in the water consumption in that city since the introduction of the waterphone in 1881. With most of these our readers are already familiar. The present consumption *per capita* is given as about 55 gallons, while that of Chicago is stated to be 120 gallons; St. Louis, 75; Detroit, 130; Pittsburg, 102, and Boston 100, notwithstanding the "peculiar conditions for waste in the old water pipes and fittings," and the great demand by the hydraulic service, which alone takes over one-eighth of the whole supply.

From Fall River, comes the report that a plumber doing repairs in a beer saloon, opened a faucet to get a drink of water, and observing its rusty color, which he took for iron, let it run to clean itself, until the proprietor observed what he was about, and without ceremony ordered him to shut off that beer faucet.

Pall Mall Gazette says the Suez canal is in a fair way to become a stagnant sewer. The stations on its banks drain into it, it is never flushed, there is no tide and the stench is becoming unbearable.

The Mayor of New Orleans, on May 15, submitted a suggestion to the Council in reference to the improvement of the drainage of the city. It is said that the city is in great need of a general plan of drainage.

Novelties.

Under this heading we propose to supplement our section of patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

URINAL WITH OIL FLUSH.

[We give this illustration and translation as indicating a certain line of invention, with no idea that water will ever become so valuable as to make this substitute tolerable or practicable.]—ED.

For the following illustrations and descriptions we are indebted to the *Gesundheits Ingenieur* of March 15. The device consists of an arrangement for automatically flushing urinals with oil instead of water every time they are used. It is designed for places where the introduction or use of water is expensive, and it is claimed to be less odorous. Aemil Ritter, in Rostock, is the inventor and patentee. The following explanation of the drawings will make clear the operation of the apparatus:

A piston *d* is forced down into a cylinder *e* filled with oil by the person stepping upon the board *c*. The oil is at the same time pressed out through the pipe *g* into the channel *h*, from which it flows over and runs down the face plate *i*. The oil not only carries down the urine, but covers the plate with a coat of oil and prevents the adhesion of the urine. As soon as the pressure is taken off the board *c*, the spring *m* forces it up and raises the piston *d*, which by suction draws the

FIG. 1.

oil back into the cylinder. At the points *f* and *n* are valves which regulate the flow of the oil. When the piston descends, the valve *f* is opened, and at the same time the valve *n* closed. When it rises the valve *f* is closed, preventing the oil from flowing back, and the valve *n* opened, allowing the oil which has run down from the plate *i* to enter the cylinder and be used over again. Both the urine and the oil are collected in the

FIG. 2.

trough *a*, but the latter remains on top and thus forms a *perfect seal*. The urine flows off through the pipe *C*, which is bent downward like a gully trap to near the bottom, and thus prevents the oil from being drawn off. The same oil can be used over and over again, the only loss being from evaporation. To further insure disinfection, it has been found advisable to add carbolic acid to the oil.

Construction Notes.

WASHINGTON.—The farce now being enacted in the proceedings against Supervising Architect Hill of the Treasury Department are thus alluded to by a contemporary. "Mr. Murch is evidently about to commence beginning to begin to inaugurate an inquiry to ascertain whether or not he can find anything on file in the office of Supervising Architect Hill on which to base charges of misconduct against that official. Mr. Murch has been anxious to begin all the while for several months, but not being a lawyer, and not being allowed by the Secretary of the Treasury to have at government expense counsel, a clerk, an office, stationery, lights, ice water, and such, and not being furnished with papers that never existed, and not being given by law compulsory process for witnesses, and not being altogether clear in his mind as to what he had better start in on first, and divers other considerations him thereunto moving not to move, he has not yet got under that full headway which a longing public had been led to expect."

CHESAPEAKE BAY.—The following bids for iron work, Sandy Point caisson, were received by Major O. E. Babcock, U. S. A., May 19, 1883, at Sandy Point Shoal Lighthouse, Chesapeake Bay:

H. A. Ramsey, $6,900; Lewis Colwell, $6,300; The Southwark Foundry and Machine Works, $8,750; E. G. Smegser, $7,278; Phœnix Iron Co., $13,127.50; West Point Foundry, $6,190; Bartlett, Hayward & Co., $7,500; Pusey, Jones & Co., $11,340; Cooper Manufacturing Co., $9,000. Joseph M. Duclos, $7,390; Wendell Bollman, $5,142.15; Allentown Rolling Mills, $6,167.

QUEBEC.—The following bids for an extra supply of water for the city were opened at the meeting of the Water Committee of the City Council, May 15:

John P. Whelan, $594,000; R. R. McGreevy & Son, $495,000; Isadore Samson & Co., $435,000; H. Beemer, with six schemes, $400,000, $375,000, $440,000, $415,000, $535,000, $525,000; Michael Starr & Co., Ottowa, $400,000; W. McLea Millbank & Co., four schemes: $439,853, $538,925, $634,592, and $649,880; C. W. Carrier, six schemes: $428,391 for eight million gallons; $493,398, $460,712, steel pipe instead of iron; $460,000, $492,000, and two and one-half cents per pound for pipe; W. L. Scott, two schemes, $550,000 and $530,000. The Water Works Committee have recommended to the City Council to adopt the tender of Messrs. McLea, Milbank & Co., for constructing water pipes from Lorette, at $439,853.

COHOES, N. Y.—On May 17 a bill was signed by the Governor amending an act providing Cohoes with a larger water supply.

LANSINGBURGH, N. Y.—A bill was signed, on May 17, providing Lansingburgh with a supply of pure and wholesome water and with proper drainage.

PHILADELPHIA.—Select Councilman O'Rourke intends to execute his $15,900 contract with the Gas Trust for ditch digging, paving, etc., although it is claimed said contract between a member of Councils and the Trustees of the Gas Works is unlawful.

COLUMBIA, TENN.—New water works were begun here on May 22, to be completed by the middle of September.

TRENTON, N. J.—The following bids for furnishing work and materials for a gasometer, 30 feet diam. by 12 feet deep, were received by Charles B. Moore, Supervisor, May 23, for the New Jersey State Prison: Phœnix Iron Works, $1,975; McKenzie & Wilkes, $1,272. The contract has been awarded to McKenzie & Wilkes.

The following bids for furnishing and materials for an iron truss roof, were received by Charles B. Moore, May 23, for New Jersey State Prison: Phœnix Iron works, $1,300; McKenzie & Wilkes $1,075. The contract has been awarded to McKenzie & Wilkes.

The Commissioners of the District of Columbia have accepted the bid of the Maryland Paving Co. for furnishing 100,000 compressed asphalt paving blocks at $62 per 1,000. They have awarded the contracts for laying the asphalt pavements on the several streets of the city, heretofore mentioned, to the only two bidders there were—Messrs. H. L. Cranford and A. L. Barber.

Gen. Wright, chief of engineers, has approved the recommendation of Major Hains to reject the bids for filling in a portion of the Potomac flats in the vicinity of Easby's Point, and has requested the acting Secretary of War to find out from the Secretary of the Navy if permission can be obtained to cut down a portion of Observatory Hill, for the purpose of filling the flats. If there is no objection the work will probably be done under the direction of Major Hains at once, as it is desired to have some firm ground there on which to accumulate material for the sea wall, etc.

PHILADELPHIA, PA.—Proposals for the construction, erection and equipment of the following machinery were opened at the Water Department by the Water Committee of Council: For two, each 15,000,000 gallon, pumping engines for the Spring Garden Station; Holly Manufacturing Co., $134,000 for both; R. Wetherill & Co., $90,000 for both; H. R. Worthington, $81,000 for both; Southwark Machine Co., $88,950 for both; Gordon & Maxwell Co., $174,840 for both; Chas. E. Bigelow, $89,000 for both. For one 10,000,000 gallon pumping engine to be placed in the Frankford Station, W. Cramp & Sons, $49,500; Philadelphia Hydraulic Works, $42,500. For a 7,500,000 gallon pumping engine for the Roxborough Station: Knowles' Pumps Works, $[illegible]; Holly Manufacturing Co., $67,000; Robt. Wetherill & Co., $45,000; H. R. Worthington, $36,000; Gordon & Maxwell Co., $78,650.

The bids were referred to the Chief Engineer and the Committee on Extension.

The Distribution Committee of the gas works has recommended the purchase of 200 improved gas lamps to be used on Broad street, from Dickinson street to Montgomery avenue, from J. Dyoit, at $9 per lamp.

CINCINNATI, O.—Benjamin Barton is the lowest bidder for sewers in Fifth, Avery, Webb and other streets, at $16,771; in District 1, Division 3, Charles M. Steele is lowest, at $102,913. The contracts have been awarded to the above named parties.

CHICAGO.—Extensive contracts for curbing, filling, grading and paving streets have been let to J. B. Smith & Co., J. A. Sackley, Conway & McAdam, Mr. P. Gerrity.

Contracts for day service pipes in sundry streets were let, May 22, to A. J. McKean & Co.

One of the numerous companies experimenting in underground conduits in which to bury telegraph and telephone wires have just received a permit to operate in the principal "down town" streets, beginning at the Chamber of Commerce.

NEW YORK.—The Argentine Edison Light Company, formed to acquire the patents granted to Thomas A. Edison by the Argentine Republic, for his inventions relating to electric lighting, etc., and to manufacture, erect, maintain, etc., apparatus in said Argentine Republic, was incorporated May 17. Capital stock, $500,000.

CINCINNATI.—The Electric Burglar and Fire Alarm Co. of Cincinnati was incorporated May 15. Capital stock $100,000.

OHIO.—Were incorporated May 15: The Greenville Building Company, of Greenville; capital stock $[illegible]; The Patent Light Company, of Kent; capital stock, $[illegible] 000.

LOWELL, MASS.—The Lowell Telephone Syndicate, on May 18, closed the purchase of the Southwestern Bell Telegraph and Telephone Co., with a capital of $[illegible]. The price paid is understood to have been fifty dollars per share.

GOVERNMENT WORK.

Custom House and Post Office, Philadelphia, Pa., opened May 23, 1883. Synopsis of bids for encaustic tile floor, received under advt. of May 2, 1883:

Edward Roote, $13,550.00; U. S. Encaustic Tile Co., $10,890.00; Wm. L. Wilson, $10,292.00; American Encaustic Tile Co., $10,500.00; Sharpless & Walter, $[illegible] 300.00; John Gibson, $12,500.00.

Custom House and Post Office, Baltimore, Md., opened May 23, 1883. Synopsis of bids for iron work (columns, beams, etc.) received under advt. of May 8, 1883:

Haugh, Ketcham & Co., $6,578.31; Bartlett, Hayes & Hayward, 6,375.00; Wendell Bellman, $6,073.45; Jones & Co., on beams, $5,852.50; H. A. Vanderbecker, $6,[illegible]; Smead & Co., $7,058.96; Phœnix Iron Co, of Trenton, N. J., $7,913.79; H. A. Ramsey, $6,495.00.

The lowest bidder for furnishing marble window sills for the St. Louis, Mo., Custom House, was the Hickey Stone Co., $436; on glass for the Paducah, Ky., Custom House and Post Office, was De Paw, $899; on slate door plates for the Baltimore Custom House and Post Office, Francis Shenton, $190; on cut granite for entrance steps, buttresses, fence coping, street curb, etc., for the Albany Custom House and Post Office, Mt. Waldo Granite Co., $2,448 for steps, buttresses, etc., and $818 for street curb.

The water debt of Brooklyn, N. Y., is now $8,859,500, and an addition of $662,500 has been authorized. The sinking fund for the redemption of this debt is made up by an annual taxation on property of $50,000, and the revenues of the Water Department, over and above its expenditures. There is at this time, in the sinking fund, the sum of $2,443,609.98. The Commissioner of City Works calculates that to pay off the existing bonds, as they fall due, out of the Sinking Fund and its accumulations from taxation and accrued interest, will require a surplus revenue of $2,798,912.77 during the next 19 years, as in addition to this, the extension of the works must be provided for, to meet the increasing demand for water. Mr. Ropes thinks that the time has not arrived for a reduction of the water rents. In this connection the *Eagle* protests against the bills which are introduced into the Legislature from time to time, to furnish water to charitable institutions gratis, and takes the ground that persons who establish such institutions ought to maintain them, and not attempt to throw a part of the burden on the taxpayers.

The Board of Health in Canada will recommend to the government the desirability of introducing a special study of hygiene in all the public schools of Ontario.

Reviews of Reports.

FOURTH ANNUAL REPORT OF THE BOARD OF HEALTH OF THE TAXING DISTRICT OF SHELBY COUNTY (City of Memphis), for the year 1882. By G. B. Thornton, M.D., President. 25 pp., 8vo. Memphis, 1883.

Dr. Thornton begins his report with the remark that the public health of the city for the past year has been better than for many years previous—certainly better than for either year since the organization of the Board in 1879. With reference to the statements which have been made in the daily press to the effect that the death rate of the city has increased since the construction of the sewers, and in consequence of them, Dr. Thornton makes an emphatic denial.

Admitting that the deaths of the city for the past two years have exceeded in number those of 1880, he explains this in part by the increase of population, and in part by atmospheric influences, which have caused a high mortality, not only in Memphis, but throughout West Tennessee, and in portions of States immediately adjacent. The number of deaths due to diphtheria, typhoid fever and scarlet fever during the last three years has been comparatively small.

As regards the sewers themselves, an extract from the report of Mr. Merriweather, the city engineer, informs us that the general system is composed of $34\frac{5}{10}$ miles of new sewers, with $4\frac{1}{10}$ miles of old sewers; $34\frac{8}{10}$ miles of subsoil drains, 4,715 water closets, 3,224 slop sinks, 179 urinals, 234 bath tubs, * * * 184 flush tanks, 36 manholes and 217 observation openings; the total cost to date being $263,136.16.

"The obstructions thus far for the two years have been altogether in the four and six inch laterals, a total of seventy-five; occasioned by sticks, rags, snuff bottles, sardine boxes, small tin cans, etc., all of which are improper substances, forbidden by law and ordinances.

"The entire cost attending the removal of these obstructions has been, for the last two years, $1,012.55. The main line sewers have never been entirely obstructed, but have had more or less of accumulations in them, requiring them to be cleaned with ball and rope on six occasions at given points where the gradients are very light; the cost of which has thus far been about $285.40 in the past two years.

"The system in the main has so far worked admirably, and has given entire satisfaction. It has, however, grown so rapidly, and now covers so much territory on the east and west side of Bayou Gayoso, that the main lines are at times taxed quite to their full capacity, showing that they will, in time, have to be enlarged at certain points.

"The new outlet, flowing directly into the Mississippi River, should be constructed as soon as assurance can be given that it will not be broken or interrupted by sudden radical changes in the course of the river in that vicinity. Until such assurance can be given, it would, in my judgment, be better to rely upon the present outlet."

The expenses of the Board of Health during the year amounted to $24,049.65, and the statement of work done shows that the city got its money's worth.

The report concludes with the recommendation that the remainder of the rotten wood pavement be removed and replaced with some kind of stone pavement, that the bayous be improved according to the plans of the Commissioner of the National Board of Health, and that the source of water supply be changed from Wolf River to the Mississippi.

We congratulate Dr. Thornton upon having produced a very interesting, instructive and practical report, and we recommend its careful perusal to all who are interested in questions of municipal sanitation.

TOTTENHAM SANITARY ASSOCIATION. Ninth Annual Report. 1882.

This little pamphlet of ten pages is mainly devoted to a discussion of the cause of the high death rate in Tottenham during 1882, as compared with that of preceding years or that of the other suburbs of London.

This high death rate is largely due to measles, scarlet fever, and diphtheria, and it is curious that the excessive mortality from these diseases is purely local and does not extend to the adjoining parishes. The committee are disposed to consider the system of sewerage as the cause of the trouble, but no evidence whatever is presented on this point.

As the object of the association is "to watch over the sanitary condition of the parish and to diffuse *sound information* on all matters connected therewith" [the italics are ours], it seems to us that such a charge against the sewer system should be based upon some facts or observations, and that these should be published. Upon the same ground we must object to the committee's method of estimating the population by taking the number of inhabited houses and multiplying it by the average number of persons per house as shown by the last census, instead of accepting the method of computation used by the Registrar-General.

The total expenses of the association during the year were about one hundred dollars, nearly one-half of which were for "election expenses."

BOOKS RECEIVED.

PRACTICAL CARPENTRY: being a Guide to the Correct Workings and Laying out of all kinds of Carpenters' and Joiners' Work. By Fred T. Hodgson. New York: The Industrial Publication Company, 1883.

ANNUAL REPORT OF THE DEPARTMENT OF CHARITIES AND CORRECTIONS OF KINGS COUNTY, for the year ending July 31, 1882.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Registrars will please notify box 578, Washington, D. C., when their supply of blank Postals is running low, in order that they may be kept supplied.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

Notes and Abstracts.

Of an urban population of 6,658,858, there died during the week ending May 19, 2,904 persons, which is equivalent to an annual death rate of 22.7 per 1000.

For the North Atlantic cities the rate was 20.6; for the Eastern cities, 24.1; for the lake cities, 19.7; for the river cities, 16.9; and in the Southern cities, for the whites, 24 3, and for the colored, 36.7 per 1,000. Of the whole number of deaths, 35.6 per cent. were under five years of age.

Accidents caused 3.5 per cent. of all deaths. Consumption caused 14 per cent. of all deaths. In the North Atlantic cities it caused 14.7 in the Eastern cities 15.6; in the lake cities, 9.5; in the river cities 13.6, and in the Southern cities, for whites, 9.8, and for colored, 3.8 per cent.

Croup caused 1.1, diarrhœal diseases 2.2, and diphtheria 2.7 per cent. of all deaths.

In the Southern cities diarrhœal diseases caused over 5 per cent. of all deaths. In the North Atlantic cities diphtheria caused 4.6 in the Eastern cities 2.4; in the lake cities 5.3, and in the river cities 6 per cent., while in the Southern cities it caused none among the colored and 0.9 per cent. among the whites. Typhoid fever caused 1.1, malarial fever 1.1, and scarlet fever 2.8 per cent. of all deaths.

The highest rate from typhoid was in the lake cities (2.1), and the lowest in the Eastern cities (0.8). The highest rate from malarial fever was in the Southern cities, for the whites (4.6). The highest rate from scarlet fever was in the lake cities (7.0 per cent. of all deaths). Pneumonia caused 9.3, congestion of the lungs 5.7, and

Digitized by Google

acute bronchitis 3 per cent. of all deaths. In the North Atlantic cities pneumonia caused 13.4, in the Eastern cities 13; in the lake cities 9.1; in the river cities 5.5, and in the Southern cities, for whites, 3.9; and for the colored 4.6 per cent.

Measles caused 2.3, puerperal diseases 1.3, small-pox 2.2, and whooping cough 6 per cent. of all deaths. The high mortality from whooping cough is among the Southern colored population, where it is 4.9 per cent. of all deaths.

BOSTON, MASS.—C. E. Davis Jr. reports 41 new cases of diphtheria, 27 of scarlet fever, and five of typhoid fever.

LYNCHBURG, VA.—Dr. Thos. L. Walker reports scarlet fever in a mild form as very prevalent.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 18 new cases of scarlet fever and six of diphtheria. The reported cases under treatment May 19 were eight of diphtheria, and 55 of scarlet fever.

PITTSBURG, PA.—Dr. Snively reports one case of small-pox.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths; under five years two; consumption caused one of the deaths.

DETROIT, MICH.—Dr. O. W. Wight reports 21 new cases of diphtheria, nine of scarlet fever and one of small-pox.

QUINCY, MASS.—Mr. Geo. L. Gill reports the prevalence of scarlet fever. During the week ending May 19, in a total of six deaths, four were caused by this disease.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISD.—Dr. T. M. Franklin, reports 1,378 insane patients remaining under treatment May 19. During the week the changes were, admissions 17, discharges five and deaths three.

PROVIDENCE, R. I.—Dr. E. M. Snow in his report for the week ending May 19, remarks, that "the number of deaths from pneumonia is quite large for the season, but will rapidly decrease when summer comes. There was one death from typhoid fever, the only one in in two weeks. The number of deaths during the week was about the average for the season, but will probably be less within the next five or six weeks. There is no epidemic of any disease in the city at the present time, and the evidences of malaria are much less prominent than at any previous time during the last year."

BALTIMORE, MD.—The Board of Health reports for the week ending May 19, shows 148 deaths; males 64, females 84; under five years 52, over 60 years 24. Small-pox caused five deaths, measles five, scarlet fever six, croup four, diphtheria seven, whooping cough none, erysipelas two, cerebro-spinal meningitis one, pneumonia four, bronchitis seven, congestion of lungs one, consumption 24, diarrhœal diseases two, typhoid fever one, malarial fever one, and violence 6. The annual death rates are reported as follows:—Whole population 18.81; white, 15.64; colored, 37.26.

MICHIGAN.—Dr. H. B. Baker, Secretary of the State Board of Health, reports the prevailing sickness of the week, ending May 12, as due to intermittent fevers, neuralgia, bronchitis, rheumatism, influenza, consumption, tonsilitis and measles. Diphtheria was reported present at 11 places, scarlet fever 16 places and measles at 31 places.

CAMDEN, N. J.—The report of Dr. H. F. Palm, for the week ending May 12, has been received. Deaths from all causes eight, under five years four. Consumption caused two deaths. No death was referred to any of the other diseases embraced in our table.

HUDSON CO., N. J.—The mortality rate in this county, for the month of April, rose 3.0 per thousand above the average rate for the corresponding months of the six preceding years. Lung diseases, according to C. J. Rooney, clerk of the county, constituted the principal causes of this increase. Consumption alone caused 67 deaths against an average of 38 in the six years and against a previous highest record of 45 deaths.

ONTARIO, CANADA.—The Provincial *Bulletin*, for the week ending May 12, shows a continued high degree of prevalence of bronchitis. Intermittent fever has increased and typho-malarial fever made its appearance. A decline from 7.1 to 4.2 per cent. has marked the progress of measles, whooping cough and diphtheria show an increase. Cerebro-spinal meningitis continues to increase in one of the sanitary districts.

SANTIAGO DE CUBA.—Consul John C. Landreau reports 17 cases of yellow fever, 11 of which were fatal during the month of April. The harbor and its vicinity is not infected.

ENGLAND AND WALES.—The return of the Registrar-General for the week ending May 5, shows the annual rate of mortality in the 28 large towns to have averaged 21.7 per 1,000. Bradford gave the lowest rate, 15.3; and Hull the highest, 31.1. No death was referred to any of the principal zymotic diseases in Wolverhampton, Derby or Halifax; whooping cough had its greatest mortality in Cardiff and Hull; measles in Sheffield, and scarlet fever in Sheffield and Leeds. The 21 deaths from diphtheria (see table) included 16 in London and two in Liverpool. Small-pox caused two deaths in London, two in Birmingham, one in Liverpool and one in Cardiff.

London.—Births 2,545; deaths 1,504. The births were 249 and the deaths 92 below the average numbers in the corresponding weeks of the past decade. The annual rate fell to 19.8. Small-pox caused two of the deaths, measles 55, scarlet fever 22, diphtheria 16, whooping cough 24, typhus three, typhoid fever nine, and diarrhœa and dysentery 17. The deaths from acute lung diseases which had declined from 672 to 445 in the five preceding weeks further fell to 371 during the week under notice, but exceeded the corrected average by 26; 198 were attributed to bronchitis, and 110 to pneumonia.

The report of the Registrar-General for the year 1882 has been received. The twenty-eight large towns included in the report comprise all the cities or municipal boroughs in which the population at the date of the last census numbered as many as 70,000 persons. The mortality rates for the aggregate was 22.3 per 1,000. Derby registered the lowest rate, 18.7 and Preston the highest 27.6. The highest annual death rates from measles, a disease from which the mortality was above the average of the preceding decade, were 1.71 in Blackburn, 1.61 in Sunderland and 1.57 in Bolton. The highest rates from scarlet fever were 1.67 in Hull, 1.45 in Nottingham and 1.42 in Sunderland. The highest rates from diphtheria were 0.82 in Portsmouth where 1.06 deaths ascribed to it, 0.25 in Cardiff and 0.22 in London. The highest rates from whooping cough were 1.20 in London, 1.11 in Brighton and 1.01 in Birkenhead. The mortality from diarrhœa, owing to the absence of continued heat in the summer, was generally below the average; the death rate from it, however, was 2.48 in Preston, 1.75 in Hull, and 1.66 in Leicester. The mortality from small-pox owing to the subsidence of the disease in London was much below the average, the rates from it were 0.39 in Newcastle, where it caused 57 deaths, and 0.26 in Nottingham, where 51 deaths were due to it.

In the 28 large towns 297,934 births and 187,931 deaths were registered, the former being equal to a rate of 35.3 per 1,000 and the latter to a rate of 22.3. Small-pox caused 675 deaths, measles 5,691, scarlet fever 4,679, diphtheria 1,330, whooping cough 7,600, fever 3,081, diarrhœa 7,194, and violence 6,160.

London.—Births, 133,200; deaths 82,905, equal to the respective rates 34.3 and 21.4. Small-pox caused 431 deaths, measles 2,329, scarlet fever 2,004, diphtheria 863, whooping cough 4,647, fever 1,117, diarrhœa 2,162, and violence 2,911.

SCOTLAND.—Consul J. A. Leonard sends report for the week ending May 5. The death-rate in the eight principal towns was 25.0 or 1.3 above that for the corresponding week of last year, but 2.6 below that for the previous week of the present year. Perth recorded the lowest rate, 15.3; and Paisley the highest, 35.3 per 1,000. Measles was the most fatal miasmatic disease, the mortality therefrom being greatest in Glasgow, where it caused 34 deaths. A slight increase is shown in the deaths from acute lung diseases.

EDINBURGH.—Deaths 74; rate 16.3. No death was recorded from small-pox, diphtheria or fever. Measles caused two deaths, scarlet fever and whooping cough, one each, diarrhœa five, acute lung diseases 14, and violence two.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the registrar-general for the week ending May 5, for a summary of which see table given above.

DUBLIN.—Births, 210; rate, 31.2; deaths, 222; rate, 33.00. No death was recorded from small-pox or measles. Scarlet fever caused two deaths, typhus and diphtheria, one each, typhoid fever and diarrhœal diseases two each, whooping cough 4, consumption 32, acute lung diseases 44 and violence four.

BELFAST.—Births, 140; rate, 34.0. Deaths, 146; rate, 35.5. No death was registered from measles or diphtheria. Small-pox caused one death, scarlet fever seven, typhus two, typhoid fever three, whooping cough six, diarrhœa six, consumption 26, acute lung diseases 30 and violence two.

PARIS, FRANCE—During the week ending May 10, there were 1,272 deaths; males 649, females 623; under five years 356, over 60 years 270. Typhoid fever caused 57 deaths, small-pox 13, measles 25, whooping cough 16, croup and diphtheria 43, scarlet fever two, dysentery one, erysipelas 3, puerperal fever seven, consumption 254, acute bronchitis 37, pneumonia 119, and violence 30. The annual rate for the week was 29.51.

On May 6, there remained under treatment in the hospitals of the city 107 cases of small-pox, 303 of typhoid fever, and 40 of diphtheria.

RHEIMS, FRANCE.—Consul John L. Frisbie reports 56 deaths during the week ending April 28; males 33, females 23; under five years 18, over 60 years 17. No death was registered from whooping cough, croup, diphtheria, puerperal fever, scarlet fever, typhoid fever or small-pox. Erysipelas caused one death, measles one, acute bronchitis two, broncho-pneumonia three, bronchial catarrh nine, pneumonia three, consumption seven, diarrhœa two and violence one. Annual mortality rate 31.03.

COPENHAGEN, DENMARK.—During the week which ended April 24 there were recorded 139 deaths; under five years, 54; over 60 years, 39. Annual mortality rate 28.1. No death was reported from small-pox, measles, croup, scarlet fever, typhoid fever or puerperal fever. Diphtheria caused two deaths, whooping cough six, diarrhœa seven, erysipelas one, consumption 10, pneumonia nine, pleurisy two, acute bronchitis five and violence two.

During the same week the following new cases were reported: Measles two, scarlet fever 10, diphtheria 14, croup five, whooping cough 47, typhoid fever four, diarrhœa 83, erysipelas 23, puerperal fever one, intermittent fever four, bronchial catarrh 252, pneumonia 76 and tonsilitis 108.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 82 deaths during the week ending April 21; males 44, females 38; under five years 28, over 60 years 17. No death was reported from small-pox or scarlet fever. Measles caused two deaths, whooping cough one, puerperal fever one, diphtheria and croup three, tyyhoid fever two, diarrhœa six, consumption 11, pneumonia 11, bronchitis five and violence four. Annual mortality rate 24.5.

During the week ending April 28 there were reported new cases of disease as follows: measles 15, scarlet fever 26, erysipelas two, whooping cough five, croup four, diphtheria four, intermittent fever 11, typhoid fever six, tonsilitis 14, pneumonia 21, pleurisy five, bronchitis 57 and diarrhœa 25.

BRUSSELS, BELGIUM.—During the week ending April 28 there were 268 births and 223 deaths, equal to rates of 33.3 and 29.0. Of the decedents 90 were under five years of age. Small-pox caused seven deaths, measles two, diphtheria one, croup four, whooping cough three, diarrhœal diseases 22, bronchitis and pneumonia 40 and consumption 34.

GIBRALTAR, SPAIN.—Consul H. J. Sprague reports, under date of April 30, that six cases of small-pox were landed on that day from British S. S. "Gulf of St. Vincent," from Bombay, India. They were conveyed to the civil hospital for treatment.

VIENNA, AUSTRIA.—Consul-General Jas. K. Weaver reports 534 deaths as having occurred during the week ending April 28, which number is equivalent to an annual mortality rate of 37.0. Small-pox caused two deaths, measles none, scarlet fever three, diphtheria six, whooping cough 14, consumption 152 and acute lung diseases 99. The deaths under five years numbered 187.

FIRST ANNUAL REPORT OF THE PROVINCIAL BOARD OF HEALTH OF ONTARIO, being for the year 1882. XXXVI. 187 pp. 8vo. Toronto, 1883.

The act establishing the Provincial Board of Health of Ontario was passed in the spring of last year, and the first regular meeting of the Board was held on the ninth of May, 1882, the Secretary, Dr. Peter A. Bryce, having entered on his duties on the first of the same month. It at once set vigorously to work to inform itself as to the best means of performing the duties imposed upon it, and seems to have taken the State Board of Health of Michigan as a model in many respects.

The most interesting part of the volume to us is that which gives an account of investigations into the causes of the prevalence of intermittent fever, and of typhoid fever, in certain localities.

The first of these relates to typhoid fever in the town of Sarnia, where this disease has prevailed to a considerable extent since a general water supply was introduced into the town. When we learn that the supply main, which extends into the bay about 280 feet, is not more than 150 feet away from the point at which the main trunk sewer empties into the bay, this prevalence of typhoid is readily understood. All the houses are not connected with the water works, some being supplied by wells. In one such house, where typhoid fever had existed for months, water was found in the privy vault within two feet of the surface of the ground. The well was fifty feet from the privy, and the soil was a loose, sandy loam.

Another report relates to an outbreak of typhoid at Stratford, which seems to have been connected with very defective sewerage and polluted drinking water. The sewer in this case had little or no fall, and was of very defective construction, so that it became in fact a long cesspool.

Two investigations were made into cases of malarial prevalence. In the first, the main question was whether large accumulations of saw-dust on the edge of a river had anything to do with causing a very extensive epidemic of intermittent fever in the village of Coboconk. The case is thus stated:

"A village situated high and dry on a rocky island between two currents of an originally swift-flowing river, with high dry rocky banks on either side. A dam at the upper end of the island on the left and another dam at the lower end of the island in the right channel. A saw-mill on the right bank, with much saw-dust distributed along the bank and in the water along the shore. Complete immunity from ague up to a period one or two years after this mill was built and saw-dust had largely accumulated. This immunity is still almost complete in the farm houses a few hundred yards back from the river bank. At a point on the right bank, some hundred yards above the saw-mill, was a small marsh of several acres, but this marsh had existed for twenty years previous to the building of the saw-mill. Here the connection between the malaria and the accumulation of damp, decomposing saw-dust seems sufficiently shown to have warranted the conclusion that such accumulation must be stopped.

A more difficult problem was presented in an epidemic at Madoc, of a peculiarly severe type of malarial fever following the construction of dams, etc.

There was a large amount of swamp lands in the vicinity, there was a mill-pond in the town, and the water in the wells varied in height with that of the pond, and both are contaminated by soakage from privy vaults and cesspools. The commission concluded that while the swamp lands were probably the original cause of the malaria, yet their ill results had been aggravated by the unsanitary condition of the village, and that the first thing to be done was to insure local cleanliness.

The reports on the Sarnia and Madoc epidemics are illustrated with maps, and are good specimens of work.

The report of the president of the Board, Dr. Oldbright, has no map, and is therefore unintelligible to those not perfectly familiar with the locality.

The Board has engaged in the work of diffusing sanitary information among the people, by means of circulars, lectures, sanitary conventions, etc., a full account of all which is given in the report before us.

The work thus far accomplished, and this its first report, are certainly very creditable to the Board, and we hope that this is but the first of a long series of valuable contributions to the literature of public medicine.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

270,112. SEALING DEVICE FOR THE OPERATING MECHANISM OF WATER CLOSETS. CHARLES F. PIKE, Philadelphia, Pa., assignor to the National Anti-Sewer Gas Company, Camden, N. J. Filed July 27, 1882. (No model.) Issued Jan. 2, 1883.

Claim.—1. A water closet bowl and receiver, or container, provided with a pan or clapper, and mechanism for operating the same, which is sealed by a fluid seal, substantially as shown and described.

2. In a water closet, the combination of the following elements, viz.: a bowl, a receiver or container, a pan or clapper for said bowl, operating mechanism therefor, and a water supply pipe having branch leading into a receptacle or chamber to form a seal for said operating mechanism, substantially as shown and described.

270,113. WATER CLOSET. CHARLES F. PIKE, Philadelphia, Pa., assignor, by mesne assignments, to the National Anti-Sewer Gas Company, of New Jersey, Filed October 5, 1881. (No model.) Issued Jan. 2, 1883.

Claim.—1. In combination with a water closet bowl, a cap or cover, a water supply pipe and a valve therefor, constructed and arranged substantially as shown and described, whereby a stream or a flow of water is caused to continuously pass through the water supply pipe to form a running water seal between said bowl and the cap or cover, substantially as set forth.

2. A water closet bowl provided with a sealing groove and a cap or cover designed and adapted to enter said groove, in combination with a water supply pipe furnished with a cock, constructed and arranged substantially as shown and described, whereby a stream of water will continuously pass through said pipe and into and out of said sealing groove, as and for the purpose set forth.

270,334. COCK FOR WATER CLOSETS. CHARLES F. PIKE, Philadelphia, Pa., assignor to the National Anti-Sewer Gas Company, Camden, N. J. Filed August 7, 1882. (No model.) Issued January 9, 1883.

Claim.—1. A cock for water closets, provided with two passage-ways, one larger than the other, the smaller of which is never closed, while the larger passage-way is adapted to be closed and opened at will, substantially as shown and described.

2. A cock for water closets, etc., provided with two passage-ways, one of which is always open for the passage of a continuous flow of water, while the other is adapted to be closed and opened at will for the passage of the flushing-water, substantially as shown and described.

3. A cock composed of a casing, a passage-way adapted to be closed by a valve having an operating stem and reacting mechanism, and an additional passage-way which is always open to permit a diminished continuous flow of water through the cock, substantially as shown and described.

4. A cock for water closets, composed of a casing, A, seat D, having opening *d*, spindle *b*, having pin *y*, valve B, and reacting mechanism G, substantially as shown and described.

270,211. WATER CLOSET SHUT OFF. JOHN FARTHING, Chicago, Ill. Filed Aug. 31, 1882. (No model.) Issued January 9, 1883.

Claim.—1. The combination, with a bowl or receptacle and its discharge pipe or tube, of an interposed flexible connection, D, lever or arm E, having fork *a*, with a return, a^1, carrying a compression bar, *b*, and bars or rods *d e* for compressing the tube, substantially as and for the purposes specified.

2. The combination, with a bowl or receptacle and its discharge-pipes, or tubes, of a flexible tube, D, weighted arm or lever, E E^1, fork *a* a^1, bar *b*, and bars or rods *d e*, substantially as and for the purposes specified.

3. The combination, with a bowl or receptacle and its discharge pipe or tube, of the flexible tube D, arm or lever E, fork *a* a^1, bars or rods *b d e*, and lift F, substantially as and for the purposes specified.

270,333. CASINGS FOR WATER CLOSETS. CHARLES F. PIKE, Philadelphia, Pa., assignor to the National Anti-Sewer Gas Company, Camden, N. J. Filed July 31, 1881. (No model). Issued January 9, 1883.

Claim.—1. A water closet casing or frame composed of removable parts or sections; whereby they may ber eadily placed in their normal positions and knocked down therefrom, substantially as shown and described.

2. A water closet frame or casing the sides and top of which are hinged together, substantially as shown and described, to permit of their being folded together, substantially as set forth

3. A water closet frame or casing the parts of which are hinged to one another so as to fold together, in combination with mechanism, substantially as shown and described, for retaining said parts in their normal position, as set forth.

270,335. WATER CLOSET. CHARLES P. PIKE, Philadelphia, Pa., assignor to the National Anti-Sewer Gas Company, Camden, N. J. Filed August 7, 1882. (No model.) Issued January 9, 1883.

Claim.—1. A water-closet bowl provided with a sealing-valve and a water supply pipe having a branch which leads into the bowl above said valve, in combination with an overflow-pipe, the lower end of which connects with the bowl below its sealing-valve, substantially as shown and described.

2. In combination with a water closet bowl, a clapper, C, operating mechanism therefor passing through a bearing in the container, a chamber surrounding said bearing, a water supply-pipe for the bowl, having a branch leading to said chamber, whereby a running water seal is provided for said bearing, substantially as shown and described.

3. A water-closet bowl provided with a sealing-valve, a water-supply pipe, a flushing pipe, an overflow-pipe, and a connection between the supply-pipe and bowl, whereby a flow of water continuously passes from said supply-pipe to the bowl, substantially as set forth.

4. The retainer or receiver B, having bearing or opening *b*, with slots b^1, in combination with inverted cup H, substantially as shown and described.

5. The combination, with a water-closet bowl, of cap E, flushing pipe F, supply-pipe D, and branch I, to form a running seal for said bowl, substantially as shown and described.

6. The combination, with a water closet bowl and sealing-valve, of water supply-pipe connections for the bowl, and a cap or cover therefor, arranged substantially as shown and described, whereby a running seal is provided for the bowl and for the operating mechanism of the sealing-valve, as set forth.

269,913. FORCE-PUMP. WILLIAM A. BICKFORD, Brantford, Ontario, Canada. Filed June 29, 1882. (No model.) Patented in Canada Oct 24, 1881, No. 13,594; extended Nov. 27, 1882, No. 15,858 and No. 15,859. Issued Jan. 2, 1883.

269,929. GAS APPARATUS. JOHN HANLON, New York, N. Y., assignor to the United Gas Improvement Company, Philadelphia, Pa. Filed July 10, 1882. (No model.) Issued Jan. 2, 1883.

269,931. GAS-BURNER. ALPHONSO S. HARRIS, Chelsea, Mass. Filed Nov. 27, 1882. (No model.) Issued Jan. 2, 1883.

269,933. INSULATOR FOR THE SUSPENSION OF ELECTRICAL WIRE CONDUCTORS. PAGET HIGGS and WILLIAM COURTENAY, New York, N. Y. Filed Dec. 31, 1881. (No model.) Issued Jan. 2, 1883.

269,937. ELECTRIC LAMP. CHARLES A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed Jan. 21, 1882. (No model.) Issued Jan. 2, 1883.

269,938. ELECTRIC-ARC LAMP. CHARLES A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed May 20, 1882. (No model.) Issued Jan. 2, 1883.

269,939. ELECTRIC-ARC LAMP. CHARLES A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed May 23, 1882. (No model.) Issued Jan. 2, 1883.

269,950. OIL AND GAS STOVE. EDWARD A. MEYSENBURG, St. Louis, Mo., assignor to the Mascotte Stove Company, same place. Filed Mar. 2, 1882. (No model.) Issued Jan 2, 1883.

270,000. CALORIC-ENGINE. THOMAS BEESLEY, Muscatine, Iowa. Filed Apr. 19, 1882. (No model.) Issued Jan. 2, 1883.

270,009. STRAIGHT-WAY VALVE. DANIEL R. BURNS, Dayton, Ohio, assignor to himself and Albert L. Jackson, Washington, D. C. Filed May 26, 1882. (No model.) Issued January 2, 1883.

270,017. DYNAMO-ELECTRIC MACHINE. ALEXANDER CHERTEMPS and LOUIS DANDEN, Paris France. Filed October 5, 1882. (No model.) Patented in France Jan. 23, 1882, No. 147,003; in Belgium March 31, 1882, No. 57,494; in England April 12, 1882, No. 1,747, and in Italy, July 24, 1882, No. 14,434. Issued Jan. 2, 1883.

270,022. MACHINE FOR PREPARING TIN PLATES FOR ROOFING. ANDREW J. CONNOR, Louisville, Ky. Filed July 25, 1882. (No model). Issued Jan. 2, 1883.

270,053. STEAM RADIATOR. PATRICK GORMLY and LEWIS BRIDGE, Philadelphia, Pa. Filed October 9, 1882. (No model.) Issued Jan. 2, 1883.

270,064. HOSE-NOZZLE. FRANCIS HICKMAN, New York, N. Y. Filed April 19, 1882. (No model). Issued Jan. 2, 1883.

270,065. HOSE-COUPLING. FRANCIS HICKMAN, New York, N. Y. Filed April 19, 1882. (No model.) Issued Jan. 2, 1883.

270,097. HYDRAULIC CEMENT. JOHN MURPHY, Columbus, Ohio. Filed Sept. 20, 1882, (No specimens.) Issued January 2, 1883.

270,100. FURNACE GRATE. BERNHARD S. NIEBELL, Scranton, Pa. Filed Nov. 23, 1882. (No model.) Issued January 2, 1883.

270,102. PUMP VALVE. WILLIAM P. OLDEN, Springfield, Ill. Filed April 26, 1882. (No model.) Issued January 2, 1883.

270,127. HEATING FURNACE. DAVID W. ROBB, Amherst, Nova Scotia, Canada. Filed June 23, 1882. (No model.) Issued Jan. 2, 1883.

270,132. ILLUMINATING TILING FOR VAULTS, etc. C. HANSEN ROSS, Chicago, Ill., assignor of one-half to L. Otis Dauchy, same place. Filed Aug. 12, 1882. (No model.) Issued Jan. 2, 1883.

270,157. BOILER FURNACE. EZRA W. VANDUZEN, Newport, Ky. Filed May 6, 1882. (No model.) Issued Jan. 2, 1883.

270,181. GAS APPARATUS. HERBERT COTTRELL, Newark, N. J., assignor to the Automatic Gas Machine Company, same place. Filed July 28, 1882. (No model.) Issued Jan. 2, 1883.

270,191. VAPOR BURNER. CHARLES A. KOEHLER, Decatur, Ill. Filed April 10, 1882. (No model.) Issued Jan. 2, 1883.

270,194. VAPOR BURNER. T. TRASK WOODWARD, Pana, Ill., assignor to Duane T. Davis, same place. Filed Oct. 13, 1882. (No model.) Issued Jan. 2, 1883.

270,202 and 270,203. GAS ENGINE. JOHN CHARTER, Sterling, Ill. Filed July 5, 1882. (No model.) Issued January 9, 1883.

270,212. RETURN FLUE BOILER. CHARLES H. FITCH, New Haven, Conn. Filed Nov. 13, 1882. (No model.) Issued January 9, 1883.

270,280. DYNAMO ELECTRIC MACHINE. JOSEPH LEWIS, Chicago, Ill. Filed Apr. 3, 1882. (No model.) Issued January 9, 1883.

270,253. VAPOR BURNER. WILLIAM SCHERER, William A. MOLL and JAMES A. MARCH, Cleveland, Ohio; said Scherer and Moll assignors to said Marsh. Filed Jan. 29, 1882. (No model.) Issued January 9, 1883.

Dr. C. W. Siemens has given a description of several electric railways to the Institution of Civil Engineers. The Lichterfelde line in Berlin has a gauge of 3 feet 3 inches, and is or nearly 1½ miles in length. It has been in operation since May 16, 1881. The line between Portrush and Bush Mills is six miles long. The two rails, which are 3 feet apart, are not insulated from the ground like the Berlin rails, but are joined electrically by means of copper staples, and form the return circuit, the current being conveyed to the car through a T-iron placed upon short standards, and insulated by means of insulated caps. At present power is produced by a steam-engine, but arrangements are in progress for the utilization of a waterfall by means of turbines. The line is to be extended to Dervock, six miles distant, so as to be brought into communication with some of the Ulster railways. Dr. Siemens believes that the electric system of propulsion is sufficiently advanced to be adapted for suburban tramways, elevated lines, and, above all, for lines through tunnels, such as the Metropolitan and District Railways. But he does not advocate its competition with the locomotive on main lines of railway.—*Metropolitan.*

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

Instruction.

Cornell University,

COURSES IN

Mechanical Engineering, Electrical Engineering, Civil Engineering and Architecture.

Entrance Examinations begin at 9 A. M. June 18, and Sept. 18, 1883.

SITUATION wanted by a married man (28), as Engineer; steady sober and attentive. Good references.
A. EATON, 65 McKibbin St., Brooklyn, E. D.

A YOUNG MAN desires a situation as plumber and gas fitter; can furnish good references. Address,
J. W. BROWN, 707 Warren Street, New York.

A GERMAN (25), learned mechanic, wants a situation as plumber; has first-class experience in setting up water-closets, baths, pumps and in gas fitting. Address,
FRANCIS HALBIG, 29 Stanton Street, New York.

WANTED.—Situation as plumber and book-keeper by a young man, aged 25, who has been in present situation 5½ years. Address, WM. S. KNIFFIN, 114 River Street, Hoboken, N. J.

A YOUNG MAN two years in plumbing trade, fair at wiping, desires opportunity to go jobbing under instructions. Address,
J. C., 81 Schenck Street, Brooklyn.

A PRACTICAL Steam Fitter and Mechanical Engineer who has had 14 years' experience in fitting up factories, etc., with gas, steam, water and the planting of machinery in general, desires a permanent situation in either a factory or a hotel.
Address, J. R., Yonkers, N. Y.

Proposals.

NOTICE TO BUILDERS OF WATER WORKS' PUMPING MACHINERY.

OFFICE OF THE COMPTROLLER,
CITY OF ALLEGHENY, PA., *May* 28, 1883.

Sealed proposals and specifications will be received at this office until 3 P. M., Monday, June 25, 1883, for the construction and erection of three four-million or two six-million pumping engines, to be located on Water Works property, River avenue, Eighth Ward, Allegheny, Pa.

The specifications will include all necessary excavating and masonry for foundations for pump well, also foundations for engines and engine house (the erection of pump house to be done by the city).

The pumping engines to be vertical with outside packed plunger pumps, and to be of a combined capacity of twelve-million gallons, pumped against a head of 220 feet in 24 hours, with a piston speed not exceeding 120 feet per minute.

The guaranteed duty must be given on the evaporation of the present boilers now in use at works.

The contractor must furnish specifications and detail drawings of engines, also plan of pump well and foundations for engines.

The whole to be erected and completed in eight months from signing of contract, in accordance with such plans as may be selected by the Superintendent of Water Works and approved by the Water Committee and Councils of the City of Allegheny, Pa.

No proposals will be considered unless in accordance with the above and accompanied by a bond equal in amount to the bid.

All information in regard to the above work will be furnished by Edward Armstrong, Superintendent of Water Works, City Hall, Allegheny, Pa.

The Committee on Water reserves the right to accept or reject any or all bids. JAMES BROWN, *Comptroller.*

PROPOSALS FOR ORDNANCE SUPPLIES.

PICCATINNY POWDER DEPOT,
DOVER, N. J., *May* 28, 1883.

Sealed proposals, upon the blank forms furnished from this office only, will be received by the undersigned until 12 o'clock M., on Thursday, June 28, 1883, for furnishing the supplies, in such quantities and at such times during the fiscal year ending June 30, 1884, as the commanding officer of this depot may require, viz.: Bricks, Lumber, Cement, Coal, Paints, Oils, Forage, Phosphates, Stationery, etc, etc.

A preference will be given to articles of domestic production. Catalogues giving the estimated quantities and articles required can be had on application at this office. Also, full information as to manner of bidding, conditions to be observed by bidders and terms of contract and payments.

The Government reserves the right to reject any or all bids.
J. P. FARLEY, *Major of Ordnance.*

PROPOSALS FOR STEAM-HEATING APPARATUS FOR FIRE PROOF BUILDING FOR PENSION OFFICE ON JUDICIARY SQUARE.

OFFICE SUPERVISING ENGINEER & ARCHITECT, 1316 N ST., N. W.
WASHINGTON, D. C. *May* 21, 1883.

Sealed proposals are invited from engineers and firms engaged in this business, for making, delivering and setting up in complete working order, a low pressure steam heating apparatus, for heating the new Pension Building on Judiciary Square, in Washington, D. C. The apparatus to be constructed in accordance with the requirements of the specifications, copies of which, and plans of the building, can be obtained at this office.

Bids should be addressed to the undersigned, and will be opened in the presence of bidders who may chose to be present, on the 25th of June, 1883. M. C. MEIGS.
Supervising Engineer and Architect.

PROPOSALS FOT IRON ROOFS, ETC., AT KANSAS CITY, MISSOURI.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEPARTMENT,
WASHINGTON, D. C., *May* 19, 1883.

Sealed proposals will be received at this office until 12 m., on the 6th day of June, 1883, for furnishing and fixing in place, complete, the Iron Roofs, Attic floor, beams, etc., required for the Custom House and Post Office building at *Kansas City, Mo.*, in accordance with drawings and specification, copies of which, and any additional information, may be had on application at this office or the office of the Superintendent. JAS. G. HILL,
Supervising Architect.

CITY COMMISSIONER'S OFFICE, BALTIMORE, *May* 22, 1883.

Proposals will be received until June 6, 1883, at 1 P. M., for furnishing 1,000,000 granite paving blocks.

Proposals will be received by the American Committee of the Statue of Liberty, 171 Broadway, until 28th inst., for demolishing the brick buildings on Bedloe's Island, and the removal of the materials.

Proposals will be received by the Selectmen of the Town of Spencer, Mass., until June 21, for building about 50 man-holes and laying about 10,000 feet sewer pipe.

Proposals for furnishing stone for a lock in Big Sandy River, Ky., and W. Va., will be received until June 20, 1883.
CAPT. JAMES C. POST, *Engineer*,
82 *W. 3rd street, Cincinnati, O.*

Proposals will be received by Richelieu Bridge Co. until June 15, 1883, for building bridges over the Richelieu River, St. Thomas, Canada.

Will be received by the Depot of Public Works, Montreal, Canada, until June 17, 1883, for new roof over Drill Hall.

Proposals will be received by the Commissioners of Hamilton County, Ohio, until June 9, 1883, for improving the Carthage pike, from the gas tank to the Colored Asylum, Millcreek and Springfield Townships. Also, for improving the Carthage pike from the canal through St. Bernard, Millcreek Township.

Will be received by the City Clerk, Columbus, Ohio, until May 26, 1883, for furnishing materials and doing the following work, to wit, Friend street; from the west side of Ohio avenue to Rose avenue, by grading and graveling the roadway.

Proposals will be received by the City Clerk, Columbus, Ohio, until June 11, 1883, for furnishing materials and doing the following work, to wit: For completing the work of constructing the brick sewer known as the "Northwest Main Trunk Sewer," in the City of Columbus.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

CHAS. J. GOOCH, Patent Attorney, St. Cloud Building, Washington, D. C. P. O. Box 76. 19 years' practice. Inventions, &c., protected in all countries. Investigations made. Legal and all other business affecting patents and inventions receive prompt PERSONAL attention. No contingent work done. Reliable service at moderate rates. Good references.

ASH'S PREPARED SOIL.

For Sale by all Leading Plumbers' Supply Stores in the United States. The demand steadily increasing. Cheaper and better than the Plumbers make themselves. Try it.

Manufactured by J. H. ASH,

55 BOERUM PLACE, BROOKLYN.

THE "JUNIOR" ECLIPSE
Pipe Cutting Machine.

This tool meets the requirements of those who have use for a Screwing Machine light enough to be readily carried about, sufficiently powerful in its gearing (18 to 1) to work easily, and strong enough to bear rough usage. All of these points, with the very important one of MODERATE COST, are to be found in the "JUNIOR" ECLIPSE MACHINE.
It will cut off and thread Pipes from ¼ to 2 inch, inclusive; can be erected on any fence, box or plank in five minutes, by simply boring two ¾ holes, and weighs complete, about 125 pounds. It has no complicated parts and nothing to break or get out of order, and will do the work of a tool costing twice its price.
We offer it, as also the large size "Eclipse," cutting 2½ to 4 inch Pipes, with the understanding that if not found satisfactory after a fair trial, it may be returned to us, within thirty days, and the purchase money will be refunded.
PRICE, Complete with Dies ¼ to 2 inches, $60.00.
PANCOAST & MAULE, 243 and 245 South Third Street, Philadelphia.

CAST LEAD LINED WATER CLOSET CISTERNS.

The following advantages are claimed:

1. *They are cast entirely in one piece from Virgin Pig Lead, without any Seam, Joint or Solder. They are supported in Strong Wood Cisterns, and are not liable to burst, as would Iron Cisterns, if exposed to frost.*

2. *They are cast stronger at the Corners, tapered each way, and it is believed will last longer than any Cistern made from Sheet Lead, burnt or soldered together.*

3. *The Working Parts have Brass Bearings. Should the Cistern get damaged, it can be easily repaired, whereas the Iron ones would have to be replaced.*

4. *Should the Cistern be pulled out, or repaired, the metal has some value, whereas broken Iron Cisterns are comparatively worthless.*

5. *These Cisterns will not rust and the water from them will not discolor the bowls of the Water Closets.*

6. *The rush of water from a Wooden Cistern, lined with lead, occasions less noise than from a Cast Iron one.*

We are now making five different styles and will be able to furnish them adapted for any style of Water Closet. Plumbers having unexecuted contracts requiring cisterns are invited to call and examine those we have thus far made.

We designate them as follows:

No. 1 *"Em Ess" Lead Cistern.*
(This is intended for flushing Hopper Closets, has an independent overflow as required by the New York City regulations.)

No 2 *"Em Ess" Lead Cistern.*
(This is the same as the No. 1, except that it has the overflow arranged to go to the Hopper, as is the usual practice in this country.)

No. 3 *"Em Ess" Lead Cistern.*
(Is the same as No. 2, with the addition of a service box of a size adapted for use over a pan closet.)

No. 4 *"Em Ess" Lead Cistern.*
(Is arranged to discharge a given amount of water by means of a syphon. The action of the syphon being started by the pulling up of a valve, a flush is sure to be obtained, since if for any reason the syphon should fail to act, a flush can be secured by holding the pull a few seconds as with the ordinary cisterns. This cistern may be used with the Hopper and wash-out style of water closets, and can be arranged to make a flushing apparatus for urinals.)

No. 5 *"Em Ess" Lead Cistern.*
(Is a double compartment waste preventing cistern; constructed so that not more than three gallons can be drawn at one pull of the handle. It is also provided with the independent overflow, and arranged to secure the minimum tax of the New York Water Department.)

No. 1, 2, 3 and 4 are made 19 x 11 x 7 inches, over-all measure, and hold three gallons.

No. 5 is 19 x 11 x 13 inches. Experience has shown that for general use this size is ample, since when the water pressure is good, it is quickly filled through the ball-cock, and when the pressure is inadequate, large storage tanks must be provided for the upper parts of buildings from which water for all the lower fixtures can be taken. In either case it will be apparent that the three-gallon size, supplied with a good pressure of water, is ample, and admits of being inclosed in a neat cabinet, thus avoiding an unsightly tank in a bath-room, where water-closets are often placed, and where the usual cistern has often been objected to by householders.

We designate these Cisterns as follows:

No. — *"Em Ess" Lead Cisterns.*

NEW DIRECT ACTING

STEAM PUMP.

For Every Imaginable Service.

A large number of these Pumps have been put on every variety of service during the past three years, with the best results.

The Pump is simple in construction, having a smaller number of moving parts than others.

It will work equally well under a light or heavy pressure, at a higher speed, with less noise than any other steam pump, and is suited for every variety of service.

All Pumps are tested at the factory under all possible speeds and pressures.

We are prepared at present to furnish all the leading sizes, and are constantly making additions to our patterns.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

BENNOR'S

Syphon Trap.

The only Brass Trap in the market at Popular Prices.

Recommends itself to Architects, Plumbers, Sanitary Engineers and Builders, because:—

It is a perfect seal with or without water. Every time a basin of water is discharged, the trap and adjoining pipes are thoroughly cleaned by syphonage. Two to three inches of water seal always retained in addition to valve seal. Trap may be set close to basin, or any distance from it with same result. Compact and neat in appearance, light in weight. Universal in its application, cannot become clogged. Simple, cheap, durable and easily adjusted. Glass or metal section furnished at same price. Send for circular and price list.

BENNOR SYPHON TRAP CO., (Limited),

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the New York Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

MAY 31, 1883.

The business manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of books treating on subjects in which the readers of that journal have a special interest.

Orders for books are therefore solicited.

ADDRESS, BOOK DEPARTMENT,
THE SANITARY ENGINEER,
P. O. Box 3037. 140 WILLIAM STREET, N. Y.

The Sanitary Engineer,

"A large and flourishing weekly journal, covering the whole field of Sanitary Science and recognized as a leading authority upon the subject."—*The Nation.*

"It is gratifying to see that the public, as well as specialists, are enough interested in Sanitary matters to give substantial support to a periodical ably endeavoring to impart much needed and vital instruction."—*N. Y. Times.*

"Standard authority on matters pertaining to its specialty."—*Am. Machinist.*

"It is a journal with a mission—that of raising the low standard of Sanitary Engineering which exists in the United States. Its large editorial staff includes the names of some of the best known and most practical writers in America on health subjects, and no pains or expense are spared in making the paper useful to the fullest extent."—*Engineering, London.*

"The leading journal of the kind published in the United States."—*Troy Times, Dec. 11, 1882.*

"The recognized American authority on all departments of Sanitary Engineering.—*Cincinnati Gazette.*

Sold by Newsdealers. 7 cents a copy.
Subscription $3.00 per annum, post-paid.

INDEX TO PATENTS.

A

PAGE.
Absorbent Cushion for Hydro-Carbon Burners ... 60
Adjustable Bracket for Heating Purposes ... 348
Tube Expander ... 516
Air Purifier ... 324
Alarm Catch Basin for Ice Boxes ... 396
Appliance for Galvanizing ... 516
Apparatus for Suspending, Raising and Lowering Electric Lamps 564
Turning off Water in Buildings ... 420
Charging Electric Storage Batteries ... 443
Vapor Baths ... 516
Regulating the Supply of Gas ... 540
Heating Freight Cars ... 540
Railway Cars ... 564
Heating Cars ... 60
Water for Boilers ... 180
Steam Heating ... 204
Raising Water through Syphon Pipes ... 251
Electrical Transmission of Power ... 276
the Manufacture of Sugar ... 324
Creating Vacuums in Incandescent Electric Lamp Globes ... 324
Feeding Shavings to Steam Boiler and Other Furnaces ... 372
Bath Purposes ... 372
Separating Petroleum Vapors ... 324
Cooling Air ... 372
Manufacturing Wood Gas ... 396
Burning Gas, ... 396
Argand Lamp ... 348
Armature for Dynamo-Electric Machines ... 516
Art of Lining Furnaces ... 132
Artificial Butter and Method of Making the Same ... 372
Artificial Fuel ... 372
Attachment to Burner for Gas, etc ... 396
Automatic Air-Cock for Steam Heat Radiators ... 132
Cut-Off for Gas Burners ... 60
Water Heater ... 396
Fire Extinguishers ... 540
Feed Water Regulator for Steam Boilers ... 564
Safety Attachment for Steam Boilers ... 588

B

Balance Globe-Valve ... 132
Ball Valve ... 204
Basin Cock and Overflow ... 396
Bath Tub ... 348
Blower for Fire Places ... 110
Boiler ... 564
Furnace ... 132, 276, 614
and Furnace ... 588
Brick for Building Arches and Furnace Roofs ... 276
Burner for Gas Stoves ... 204

C

Caloric Engine ... 614
Carbon Holder for Arc Lamps ... 324
Carbureting Apparatus ... 60
Carburetor ... 516
Car Heating Apparatus ... 180
Carpenter's Vise ... 110
Car Ventilation ... 348
Stove ... 564
Casings for Water Closets ... 614
Cesspool ... 443
Chain Pump ... 60
Chandelier for Electric Candles ... 372
Chimney Cowl ... 396
Top and Ventilator ... 396
Flue ... 516
Cistern for Water Closets ... 588
Cock for Water Closets ... 614
Cock ... 276
Cock and Faucet ... 132, 588
Compression Cock ... 110
Compound for Furnace Linings ... 132
Coupling for Tubing ... 86
Compound for Furnace Linings and Fire Brick ... 132, 276, 324
Combined Heater and Ventilator ... 251
Compound for Fire Brick, Furnace Linings, etc ... 276
Combined Gas and Oil Burner ... 372
Commode ... 443
Composite Pavement ... 564
Compound for the Manufacture of Artificial Stone ... 588

PAGE.
Concrete Arch for Sidewalks and Over Areas ... 564
Conduit for Electric Lines ... 372
Electrical Conductors ... 372, 540, 564
Underground Line ... 396
Electric Wires ... 564
Construction of Arches ... 396
Cooking and Heating Stove ... 516
Attachment for Oil Stoves ... 516
Cooling Petroleum Distillates ... 372

D

Device for Tapping Mains ... 276
Burning Crude Oil in Stoves and Furnaces ... 348
Heating Railroad Cars ... 372
Burning Petroleum ... 420
Washing a Combined Urinal and Privy Cover ... 564
Discharge Pipe for Hose ... 204
Domestic Garbage Burner ... 110
Double Acting Pump ... 516
Drain Tile ... 204, 420
and Sewer ... 348
Pipe Turner ... 564
Driving Tube Wells ... 396
Dust and Sewer Trap ... 492
Dynamo or Magneto-Electric Machine ... 86
Dynamo or Magneto-Electric Machine ... 110
Electric Machine ... 60, 443, 516, 564, 588, 614, 614

E

Eaves-Trough ... 516
Hanger ... 216
Eccentric-Shaped Filter ... 443
Electric Arc Lamp ... 40, 180, 251, 324, 564, 614
Distribution and Translation System ... 86
System ... 372
Lamp ... 60, 251, 276, 324, 614
Support ... 180
and Holder for the Same ... 180, 204
Incandescent Lamp ... 204, 588
Light ... 251
Lighting System ... 251
Light Chandelier ... 348
Pumping Apparatus ... 396
Cable ... 324, 420, 443, 564
Fire Alarm and Extinguisher ... 564
Current Meter ... 564
Wire Cable ... 588
Motor ... 588
Lamp ... 614
Electrical Low Water Detector ... 204
Alarm for Steam Boiler Cleaners ... 204
Fixture ... 348
Igniting Device for Gas Engines ... 396
Exhaust Steam Trap ... 132
Expansion Coupling for Steam Pipes ... 132
Extension Gas Fixture ... 516

F

Faucet ... 86, 132, 348, 372
Attachment or Cask Stopper ... 372, 396, 443, 564, 588
Feeding Air to Furnaces ... 492
Feed-Water Heater ... 540, 564
Filter ... 60, 132
Filtering and Purifying Water in Wells ... 60
Apparatus ... 110
Filtering Petroleum Distillates for the Separation of Paraffine ... 372
Filtering Funnel ... 372
Fire-Place Attachment ... 132
Frame ... 276, 372
Grate ... 396
Place ... 372, 396
Grate ... 396, 443, 540
Escape ... 540, 564
Flexible Self-Gauging Faucet ... 372
Flood Valve for Drains ... 180
Gate ... 348
Fence and Gate ... 348
Flushing Basin for Water Closets ... 492
Force Pump ... 348, 516, 614
Funnel Trap for Sinks ... 372
Furnace for Privies ... 86
Grate ... 132, 420, 614
Door ... 516, 588

G

Galvanic Battery ...
Garbage Receptacle ...
Gas Cooking Stove or Range ...
and Lamp Burner ...
Engine ...
Cut-off ...
Burner Gage ...
Test and Pressure Gage ...
Burner ...
Stove and Burner and Heating Drum ...
Generator ...
Lamp ...
Pump ...
Retort Furnace ...
Regulator ...
Meter ...
Apparatus ...
Gasoline Burner, Attachment for Cook Stoves ...
Stove ...
Globe Valve ...
Governor for Gas Exhausters ...
Grate ...
Bar and Furnace ...
for Boiler Furnaces ...
Bar ...
Basket ...
Section and Fire Bed for Stoves, Furnaces, etc ...

H

Heater for Dwelling Houses ...
Attachment for Stoves ...
Heating Appparatus ...
Stove ...
Apparatus ...
Furnace ...
High and Low Steam and Water Alarm ...
Hose Nozzle ...
Coupling ...
Hot Water Heating Apparatus ...
Air Generator for Fire Places ...
Register ...
Furnace ...
Hydrant ...
Hydraulic Main ...
Pressure Pump ...
Cement ...
Hydrocarbon-Burner for Illuminating purposes ...
Gas Burner for Blast Furnaces and other Purposes ...
Furnace ...
Engine ...
Burner ...

I

Illuminating Basements ...
Tiling for Vaults, etc ...
Implement for Cleaning Water Closet Bowls ...
Incandescent Electric Lamp ...
Incandescing Electric Lamp ...
Incandescent Electric Lamp Holder ...
Increasing and Reducing Joint for Electric Wire Conduits ...
Insulating Material for Electric Uses ...
Compound for Electric Wires ...
Wires ...
Insulator for the Suspension of Electrical Wire conductors ...

J

Joint Wiper ...

L

Lamp ...
Burner for Heavy Oils ...
Lighter ...
Lead Armored Electric Cable ...
Trap or Cesspool ...
Lime Heating Foot Stove ...
Liquid Pump ...
Lock Faucet ...

M

Machine for Bending Gas Pipe ...
Tapping Water and Gas Fittings ...

Machine for Welding Pipe, etc. 372
Cutting Sewer Pipe Rings 396
Making Carbon or Gas Black 564
Preparing Tin Plates for Roofing 614
Magazine Drum Stove 443
Magneto-Electric Machine 86
or Dynamo Electric Machine 324
Manifold Pipe Joint 110
Manufacture of Incandescing Electric Lamps 110
Refractory Furnace Linings 132
Refractory Furnace Linings and Fire Brick 132
Compounds for Furnace Linings and Fire Brick. 276
Glucose from Cactus 324
Lead Pipe 564
Artificial Marble for Bath Tubs, etc 564
Means for Warming Railway Cars by Steam 132
Measuring Electric Currents 396
Carrying and Conducting Electric Wires 492
Fastening Hydrant Tops, etc 516
Supplying Water to Houses 540
Medicinal Compound 546
Mercury Seal-Joint Trap for Bath Tubs, etc 588
Meter for Steam Heating Apparatus 251
Method of and Apparatus for Detecting Leakage in Conduits 396
Movable Dam 492

N

Non-Absorbing and Heat Insulating Material 372

O

Oil Stove 60, 110
Lamp Stove 516
Stone Holder 564
and Gas Stove 614
Operative Tank Valves 420
Outlet for Tanks of Steam Heating Apparatus 540
Overflow Valve for Wash Basins 420

P

Packing for Pipe Joints 251
Pavement 564
Percolator for Rosin 348
Petroleum Burner 396
Pipe Joint 396, 564
Coupling 110, 516, 564
Wrench 516, 540
Piston Water Meter 443
Pneumatic Apparatus for Removing Night Soil from Cesspools 324
Portable Water Closet 60
Mold for Cisterns 204
Water Closet 540
Pump 588
Process of and Apparatus for Manufacture of Gas 40
Manufacturing Gas 276, 540
Manufacturing Gas 276
and Apparatus for Manufacturing Hydrogen Gas 276
Insulating Wires for Electric Uses, 372
Preventing the escape of Gas from Oil Wells between the Flows of Oil 396
and Apparatus for Distributing Liquid Fuel in cities, 492
Generating Gas 516
Treating Incandescents 540
Pump 40, 132, 251, 276, 324, 396, 492, 516, 564
Valve 60, 614
Cylinder 564

R

PAGE.

Rachet Wrench 516
Radiating Flue 396
Radiator 372
Rain Water Cut off 51
Range 516
Registering Gas Consumption and Manufacturing to a Standard, 132
Regulator for Dynamo-Electric Machines 110, 251, 588
Regulator for Electric Generators 180
Regrinding Valves 372
Return Flue Boiler 614
Revolving Table for Tile Mills 443
Rotary Pump 40, 132, 276
Water Meter 110, 372
Differential Force Pump 518

S

Safety-Valve 420, 564
Steam Boiler 564
Sand Pump 372
Sealing Device for the Operating Mechanism of Water Closets 614
Secondary Battery 492, 443
Sediment Trap 251
Self-Luminous Paint 110
Closing Faucet 420
Sewer Gas Trap 492
Sheet Metal Pipe Joint 276
Shield for Protecting Taper Flame of Gas Burners 324
Syphon Pump 324
Skylight and Ventilator 276
Smoke and Gas Consuming Furnace 60
Consumer for Furnaces 492
Consuming Furnace 516
Soldering Tool 564
Spout for Wooden Pumps 396
Stand and Tank for Vapor Stoves 564
Stationary Wash Bowl 251
Steam Boiler and other Furnaces 492
Pumping Machinery 492
Generator 276, 443
Trap 40, 86, 110, 396, 420, 443, 492, 588
Heating Apparatus 251, 348
Pumping Engine 251, 276
Gauge Cock 276, 372
Heat and Power Distributing Apparatus 276
Boiler Furnace 276, 420
Boiler Tube 324
Boiler 396, 516, 540
Pump 396, 516
Packing 396
Piping for Buildings 540
Radiator 614
Stop-Valve for Water and Gas 348
Cock 420
or Gate Valve 540
Stove 132, 396, 516
Grate 110, 132
Pipe Damper 276
Straight-Way Valve 614
Submarine Electric Cable 420
Support for Electric Lights and Conductors 86
Supply Tank for Water Closets 348
System of Producing and Controlling Currents of Air for Cooling, Warming, Ventilating, etc 180

T

Tank Spout 492
Tile for Wells and Cisterns 180

PAGE.

Tinman's Furnace 132
Tinner's Tool 204
Fire-Pot 564
Tower for Electric Lights, etc 372
Trap 396
Trap for Waste Pipes 204
and Overflow Stop for Wash Basins 324
for Wash Stands, etc 588
Tube Cutter or Expander 180
Tubular Well 546
Lamp 564
Drill for Boring Artesian Wells 588

U

Underground Conduit for Electric Wires 132
Electrical Conduit 372
Telegraph Line 396, 516
Uniting and Branching Electric Cables 443
Urinal 443
Utilization of By-Products in the Manufacture of Coal Gas 86
Utilizing Exhaust Steam 492

V

Valve 40
for Well Buckets 60
Vapor Burner 204, 276, 396, 516, 540, 588, 614
Stove 180, 396, 516
Ventilator 180, 251, 396, 443
or Chimney-Cap 251
Vent-Faucet 60
Ventilating Pipe and Cowl 348
Vent-Valve 348
Ventilating Device 540
Apparatus 372
Ventilation 492

W

Wash Stand 443
Waste, or Sewer Trap 348
Water Closet 86, 324, 372, 420, 443, 558, 614
Shut Off 614
Valve 180, 348, 372
Gas, Sewer or Drain Pipe 180
Sink 40
Meter Connection 180
Filter 180, 516
Closet Tank or Cistern 204
Meter and Filter 251
Grate Bar 276
Closet Cistern 324
Meter 324
Closet and Urinal 324
Filtering Device 372
and Steam Meter 540
Raising Device 564
Trap Cleaner 420
Gauge and Alarm 443
Cock 443
Fittings 492
Well Auger 396, 564
Wet Gas Meter 443
Window Ventilator 132
Wing Gate for Fushing Sewers 516
Wire Support for Underground Conduits 251
Tubing 396
Wooden Pipe 420
Wrench 516

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.
